To evaluate benefits from water storage in Iowa's proposed Ames Reservoir estimates of future water demand for the City of Ames, the University, and commercial and industrial concerns, potential population growth in the region, and capacities and cost of alternative sources of water supply including the reservoir's are limned. Future water demands were estimated by projecting per capita demand rates, population growth, economic growth, etc. Three levels of projected use rates and population growth rates indicate no additional water sources will be required during 1970-2020 under low estimates. Medium estimates show that other sources than the existing well fields will be required by 2000. Augmentation sources considered include deepwater wells (poor quality) and the proposed reservoir used either to recharge or sustain the shallow well system at its present drawdown levels or to provide water of similar (high quality) to shallow wells. Under medium projections, the total annual benefits--determined from the cost differential to provide equivalent high quality water, or reservoir water supplies--equaled $1430-$2170 (assuming varying discount rates). Less than 500-acre feet of storage and release levels of 0.2-0.5 cfs were required to meet demand. Under high projections values of $6080-$9110; 1500-2000 acre-feet, and 2-3 cfs were estimated. STREAM WATER QUALITY AS IT IS INFLUENCED BY URBAN COMMUNITIES,
Iowa State Univ., Ames. Dept. of Civil Engineering.
E. R. Baumann, and M. D. Dougal.
In: Ames Reservoir Environmental Study. Appendix 5. Physical Relationship with the Urban Sector, Iowa State Univ. Report ISWRRI-60-A5, 1973, p 5-4-i--5-4-91. 22 fig, 15 tab, 17 ref.

Descriptors: *Reservoirs, *Water quality, *Urban hydrology, Water quality standards, Waste water(Pollution), Waste water treatment, Iowa, Municipal wastes, Rivers, Streams, Water pollution sources, Low-flow augmentation, Upstream, Downstream.
Identifiers: *Ames Reservoir(IA), *Skunk River(IA), Ames(IA), Story City(IA).

The impact of urban waste water treatment on the water quality of the Skunk River and Iowa's proposed Ames Reservoir, located on the Skunk, is assessed. Seven communities above the proposed dam were found to discharge effluents into the river. Four presently utilize waste stabilization lagoons or ponds, which, if properly designed and operated, adequately meet existing state water quality standards. Two others still utilize septic tanks but their small size precludes significant impact on stream quality. The seventh, Story City, utilizes an Imhoff trickling filter plant which has on a number of occasions discharged improperly treated wastes into the river. Under existing quality standards the cities' waste treatment facilities must be upgraded to meet the 85-90% BOD and suspended solids removal requirement. Future plans to raise water quality levels to protect the aquatic community between Story City and Ames will require improved treatment. Reservoir construction would require improved coliform reduction. For Ames, downstream treatment facilities must be improved to meet quality standards and growth requirements. While the proposed reservoir may provide low flow augmentation, higher quality standards may require greater treatment expenditures in the future. (See also W74-11614) (Schroeder-Wisconsin)

WASTE WATER TREATMENT NEEDS FOR AMES,
Iowa State Univ., Ames. Dept. of Civil Engineering.
J. C. Young.
In: Ames Reservoir Environmental Study. Appendix 5. Physical Relationship with the Urban Sector, Iowa State Univ. Report ISWRRI-60-A5, 1973, p 5-6-i--5-6-45. 7 fig, 27 tab, 3 ref.

Descriptors: *Projections, *Treatment facilities, *Waste water(Pollution), Cost analysis, Water quality standards, Forecasting, Reservoir construction, Water utilization, Infiltration, Suspended solids, Design.
Identifiers: *Ames Reservoir(IA), *Ames(IA), Skunk River(IA), Waste water flow.

Changes in state and federal water quality requirements and population growth have placed increasing burdens on Ames, Iowa existing trickling filter waste water treatment facilities. Future population projections for Ames are subject to enrollment levels at Iowa State University and influx of new industry into the area. Annexation may also increase sewer service demand. To evaluate increased water demand three population projections--low, medium, and high--are utilized. Waste water flow was shown to represent 72% of the total per capita water usage in dry years. In wet years an additional increment of 25 gallons per capita per day must be added to allow for infiltration. Principal industries contributing to Ames waste water flows are typically low-volume water users, whose combined flowage is not expected to exceed 10%. Variations in waste water flow also need to be considered as maximum flows occur in the spring when runoff and infiltration are greatest. Organic loads received by the present Ames treatment plant are also erratic. A comparison of costs to meet waste water projections, assuming a 7% interest rate and a 25-year design period, indicates that the trickling filter remains the cheapest treatment method of a number considered. REGIONAL WATER SUPPLY AND WATER QUALITY CONCEPTS AND MANAGEMENT ALTERNATIVES,
Iowa State Univ., Ames. Dept. of Civil Engineering.
D. C. Rovang, D. W. Hubly, and M. D. Dougal.
In: Ames Reservoir Environmental Study. Appendix 5. Physical Relationship with the Urban Sector, Iowa State Univ., Report ISWRRI-60-A5, 1973, p 5-7-i--5-7-51. 6 fig, 15 tab, 22 ref.

Descriptors: *Regions, *Regional analysis, *Water supply, *Waste water treatment, *Management, Sewage districts, Alternative planning, Projections, River basins, Iowa, Water sources.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Regional management techniques are discussed in three studies of water supply and waste water treatment in the upper Skunk River Basin, site of

Iowa's proposed Ames Reservoir. A brief review of the water supply and projected water demand is generated. No county-wide water supply system exists in the upper basin, each municipality drawing from surficial, the upper, and lower bedrock aquifers. A proposed regional water supply plan, utilizing local communities (e.g., Ames) having good quality groundwater supplies as purveyors for the surrounding agricultural region, is examined. Waste water management factors affecting municipalities in an 800 sq mi portion of the basin were collected through interviews with local and state officials. Performance, operation, and financing data collected from 15 communities in the study area indicate potential economies of scale could result from a regional approach to waste water treatment. A third study investigated potential waste water treatment considerations for the area surrounding the Ames Reservoir. Increased treatment facilities would be required in Story City, resulting from population growth and/or annexation. Treatment needs produced by growth on the reservoir's west side area are also projected. Two regional alternatives, each costing $1.3 million in capital costs, to alleviate waste water problems are examined. (See also W74-11614) (Schroeder-Wisconsin)
W74-11621

URBAN FLOOD DAMAGES,
Iowa State Univ., Ames. Dept. of Civil Engineering.
R. L. Rossmiller, and M. D. Dougal.
In: Ames Reservoir Environmental Study. Appendix 5. Physical Relationship with the Urban Sector, Iowa State Univ. Report ISWRRI-60-A5, 1973, p 5-8-i--5-8-26. 5 fig, 7 tab, 11 ref.

Descriptors: *Cities, *Iowa, *Flood control, Watershed management, Flood plain zoning, Flood plains, Nonstructural alternatives, Flood damage, Reservoir construction, Alternative planning, Land use, Flood protection, Legislation, Zoning.
Identifiers: *Skunk River Basin(IA), *Ames Reservoir(IA), Story City(IA), Colfax(IA), Reasnor(IA).

Of the total $14,872,000 estimated flood damages resulting within Iowa's Skunk River Basin in six major periods only $29.600 was attributable to urban communities. The impact on urban flood damage of the proposed multiple-purpose Ames Reservoir is explored for Ames, Story City, Colfax, and Reasnor. The flood plain of Story City is devoted to public uses including a park, a golf course, an athletic field, and a sewage treatment plant. Under the proposed Ames Reservoir, the flood plain will be inundated. An additional $244,000 worth of work, including control levees and road elevation is needed to protect much of the existing flood plain improvements. A reduction of the proposed reservoir's conservation pool and flood storage will eliminate the need for this remedial work. At Ames, most of the flood plain is devoted to agricultural or park purposes as existing zoning and management policies have limited new construction within that city's flood plain. The proposed reservoir will eliminate flood damage to the city. Reasnor and Colfax flood damage predicted through the log normal flood frequency method indicates that additional benefits will result from the proposed reservoir. Flood plain management to reduce flood damage in the basin is also discussed. (See also W74-11614) (Schroeder-Wisconsin)
W74-11622

AMES RESERVOIR ENVIRONMENTAL STUDY. APPENDIX 6. DETAILED ECONOMIC REVIEW AND PROJECT EVALUATION.
Iowa State Water Resources Research Inst., Ames.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 405, $9.00 in paper copy, $2.25 in microfiche. Report ISWRRI-60-A6 (IURR-FRS-9-A6), 1973. 116 p, 1 fig, 25 tab, 10 ref. OWRT A-999-IA (8f).

Descriptors: *Decision making, *Social participation, *Reservoir design, *Evaluation, Iowa, Economic impact, Water resources development, Regional development, Social impact, Social needs, Economic efficiency, Cost-benefit analysis, Cost-benefit ratio, Cost analysis, Interest rates, Economic life, Multiple-purpose projects.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

This examination of physical, social, and economic implications of Iowa's proposed Ames Reservoir includes results of an economic analysis of alternative development plans on the Skunk River. A reassessment of the Corps of Engineers projected costs and benefits arising from the alternative designs is first considered. The unit costs utilized by the Corps were judged realistic. Projected total costs, not including land costs, of the Ames Reservoir were shown to rise significantly with postponement, varying from $9,829,000 - 1968 to $37,052,000 - 1990. The benefit-cost generated by the Corp's assuming a 3-1/4% interest rate, a 100-year project life, and a log-normal flood frequency approach equaled a 1.6:1 ratio. Under alternative assumptions of a 4-5/8, 5-1/2 or 7% interest rates-- the latter two representing current FY '73--and proposed Water Resources Council rates, a 50-year life, and the USGS regional flood frequency methods, significant declines in the benefit-cost ratios were found. An alternative evaluation procedure--incident impact approach--is also considered. The approach generates a relationship between allocative designs' consumptive and productive activities and resultant physical, social, and political impacts. Affected interest groups are identified and impacts displayed to facilitate each group's participation in the decision process. (See W74-11624 thru W74-11627) (Schroeder-Wisconsin)

PROJECT IMPACT EVALUATION,
Wisconsin Univ., Madison. Dept. of Agricultural Economics.
D. Bromley.
In: Ames Reservoir Environmental Study. Appendix 6. Detailed Economic Review and Project Evaluation, Iowa State Univ., Ames, Report ISWRRI-60-A6 (IURR-FRS-9-A6), 1973, p 6-1-2--6-1-24. 6 ref.

Descriptors: *Project planning, *Decision making, *Water resources development, *Evaluation, Economic impacts, Social participation, Reservoir design, Iowa, Environmental effects.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), Project impact evaluation.

Water development project evaluation procedures are explored. Traditional evaluation procedures have generally been criticized because they are apparently used only to justify a local coalition of affected interest groups to predetermine project design. The Water Resources Council has asserted instead that planners should ascertain whether the project design will effectively contribute to broad national and regional development, environmental quality, and social well-being. Such an approach is inadequate because of its failure to embrace the basic rationale that governmental intervention is to provide assistance in solving local water-related problems. A third evaluation procedure, impact analysis, seeks to identify all relevant impacts on local interest groups, and to facilitate broad participation in the decision process. The effectiveness of any interest group in promoting its goals depends on a number of factors including its status, number, and commitment. Methods to value these impacts are discussed. Monetary impacts may be valued using an intermediate good method, inferences from price-quantity behavior, market analogy and alternative costs, or the administrative fiat approach. Non-monetary impact must be displayed in a manner which facilitates understanding. Use of an impact matrix to display both impact forms and to facilitate ready comprehension by those affected is suggested. (See also W74-11623) (Schroeder-Wisconsin)
W74-11624

A REVIEW OF COST ESTIMATES FOR PROPOSED AND ALTERNATIVE DESIGNS, AMES RESERVOIR, SKUNK RIVER, IOWA.
Green (Howard R.) Co., Cedar Rapids, Iowa.
In: Ames Reservoir Environmental Study. Appendix 6. Detailed Economic Review and Project Evaluation, Iowa State Univ., Ames, Report ISWRRI-60-A6 (IURR-FRS-9-A6), 1973, p 6-2-i--6-2-18. 1 fig, 6 tab.

Descriptors: *Estimated costs, *Reservoir design, *Alternate planning, Cost analysis, Evaluation, Iowa, Elevation, Reservoir operation.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Cost estimates prepared by the Corps of Engineers for Iowa's proposed Ames Reservoir are reassessed and a major alternate design (wherein the dam and spillway would be lowered ten feet below the original design) which would reduce the project's scope is evaluated. Additional construction costs resulting from future delays are assessed for 1973, 1975, 1980 and 1990. The modified design will reduce the storage surface area by 45,000 and 18,000 acre-feet for the full flood control and conservation pools, respectively. Under the original design levees would be constructed at Story City to protect against flooding until the water surface elevation reaches 981 feet. Under the alternate design no levees would be constructed with consequent potential inundation of areas containing the waste treatment plant, sewage plant, wells, and lift stations in Story City. A review of unit costs used by the Corps proved them realistic. Projected total costs, not including land costs, varied from $9,829,000, $13,387,000, $15,182,000, $20,496,000, and $37,052,000 for 1968, 1973, 1975, 1980 and 1990. Cost differential between the original design and the modified design using 1968 prices resulted in a $1,733,700 reduction. (See also W74-11623) (Schroeder-Wisconsin)

PROJECT BENEFIT-COST ANALYSIS,
Iowa Univ., Iowa City. Inst. of Urban and Regional Research.
K. J. Dueker.
In: Ames Reservoir Environmental Study. Appendix 6. Detailed Economic Review and Project Evaluation, Iowa State Univ., Ames, Report ISWRRI-60-A6 (IURR-FRS-9-A6), 1973, p 6-3-i--6-3-24. 10 tab, 4 ref.

Descriptors: *Cost-benefit analysis, *Economic justification, *Reservoir design, Cost comparisons, Cost-benefit ratio, Cost analysis, Interest rates, Indirect costs, Benefits, Water resources development, Iowa, Flood frequency, Feasibility studies, Financial feasibility, Diseconomies of scale.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), Inflation impact.

Benefits and costs estimates of Iowa's proposed Ames Reservoir made by the Corps of Engineers are reassessed. The Corps was required to utilize an interest rate of 3-1/4%, a 100-year project life, and a log-normal flood frequency approach. The review re-examines the sensitivity of benefit and cost estimates utilizing interest rates of 4-5/8, 5-1/2 and 7%, the latter two representing the FY 1973 and proposed Water Resources Council rates, respectively. A 50-year useful life and the USGS regional method of forecasting flood frequency were also substituted. Utilizing 1968 benefit and cost estimates, the 4-5/8% interest rate and the assumptions of the Corps earlier benefit-costs, ratio estimate decreased from 1.6:1 to 1.3:1. Similarly,

under 1973 benefit and cost estimates, and the Corps guidelines for flood and low-flow augmentation, benefit-cost ratios of 1.4:1, 0.95:1 and 0.77:1 were estimated under interest rates of 3-1/4, 5-1/2 and 7%. Utilizing the USGS frequency method and an interpretation that EPA water quality standards require advanced treatment, benefit-cost ratios of 0.8:1, 0.54:1, and 0.43:1 were generated, respectively. Costs and benefits including loss of the tax base, access to gravel resources, and of income to agricultural suppliers, not generally included in traditional benefit-cost analyses, are also considered. BROADER EVALUATION CONSIDERATIONS,
Iowa Univ., Iowa City. Inst. for Urban and Regional Research.
J. S. Drake, K. J. Dueker, and J. F. Hultquist.
In: Ames Reservoir Environmental Study. Appendix 6. Detailed Economic Review and Project Evaluation, Iowa State Univ., Ames, Report ISW-RRI-60-A6 (IURR-FRS-9-A6), 1973, p 6-4-i--6-4-33. 9 tab.

Descriptors: *Environmental effects, *Water resources development, *Reservoir design, Economic impact, Political aspects, Regional development, Decision making, Iowa, Social impact, Social participation, Institutions, Evaluation, Alternative planning.
Identifiers: *Project impact, *Ames Reservoir(IA), *Skunk River Basin(IA).

An incident impact evaluation paradigm, providing a balanced purview of monetary and nonmonetary impacts, causes and incidences is developed and a broad strategy to utilize the resultant data to facilitate wider public participation in the evaluation process is suggested. To illustrate the paradigm, impacts resulting from nine alternative project designs on Iowa's Skunk River Basin include the proposed Ames Reservoir, a tributary development lake, a green belt design, and the preservation of the status quo are identified. The paradigm is composed of two stages. In the first, the relationship between physical, social, and political impacts are related to a number of production and consumption activities involved in each alternative. Impacts identified under each pair of impacts and activities, for instance, include physical production: reduction in upstream resources; physical consumption: equilibrium levels of reservoir/stream water quality and the creation of mud flats; social production: disruption of households; social consumption: patterns of residential development, and political production: loss of local tax base. The second stage of the paradigm identifies special interest groups and articulates the incidence and level of impacts accruing to each. For example, impacts of concern for recreational and agricultural interest groups are displayed for each of the nine alternatives examined. (See also W74-11623) (Schroeder-Wisconsin)

URBAN WATER RESOURCES--SOME PLANNING FUNDAMENTALS,
Cornell, Howland, Hayes and Merryfield, Reston, Va.
L. S. Costello.
Journal of the Urban Planning and Development Division, American Society of Civil Engineers, Vol 100, No UP1, Proceedings paper No 10413, p 57-71, March 1974. 6 fig, 1 tab, 6 ref.

Descriptors: *Regional planning, *Water resources development, *Systems analysis, Computer programs, Standards, Costs, Decision making, Management, *Alternative planning, Cities, Urbanization, *City planning.
Identifiers: Objectives, Impact, Policies, Social participation.

The deteriorating quality of surface and subsurface waters in urban regions has prompted a review of planning fundamentals. The management process involves the initiation of political leadership, establishment of a goals structure, identification of alternatives and courses of action, evaluation of alternatives, selection of a course of action, implementation of the selected alternatives, and measurement of the performance of the previous action. A goals structure is proposed that offers operational definitions for values, goals, objectives, standards, policies, plans, and programs. A process for measurement of program performance with respect to goal achievement is given. A systems definition of the urban water resource provides a basis for the identification of alternate courses of action. Displaying alternate decisions using a decision tree is illustrated. Monetary costs, potential impact, and implementability are suggested as a framework to compare alternatives. (Bell-Cornell)

SURVEY OF ECONOMIC-ECOLOGIC IMPACTS OF SMALL WATERSHED DEVELOPMENT,
Georgia Univ., Athens. Inst. of Natural Resources.
R. M. North, A. S. Johnson, H. O. Hillestad, P. A. R. Maxwell, and R. C. Parker.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 407, $4.75 in paper copy, $2.25 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No ERC-0974, June 1974. 122 p, 10 fig, 28 tab, 33 ref.

Descriptors: *Evaluation, *Project feasibility, Benthos, Flood control, Water supply, Recreation, *Wildlife habitats, Benefits, Economic justification, Income analysis, *Environmental effects, Small watersheds.
Identifiers: *Ecological impact, Land values, Tree growth.

Water resources project evaluation methodology is examined in order to identify values and procedures that will more fully account for positive and negative project-induced changes to the economy and ecology of an area. A detailed case study of two small projects was used (1) to compare actual with pre-estimated benefits and costs, (2) to estimate other ecologic and economic changes induced by the projects, and (3) to suggest methods for better prediction of impacts from future projects. Economic and ecologic impacts over a period of up to 15 years after project completion were measured. These results were compared with the project planning estimates, and an analogue pair of similar watersheds were studied to control for exogenous (non-project) impacts or activities. Measurements were made of flood protected areas, tree growth with stream modification, benthos and fish populations, water quality and wildlife with stream modification, and of such surrogate indicators of impact as land values and incomes. Ex ante estimates of benefits and costs were found subject to several measurement and prediction errors which reduced realized (ex post) benefit-cost ratios to 0.2 to 0.5. The small watershed projects studied did not perform as well as expected, primarily due to exogenous factors such as the general decline of agriculture in the watersheds. The ecologic impacts measured were not judged to be serious, either positively or negatively. Tree growth, benthos and fish populations, and water quality were not significantly different between project and non-project watersheds. The report provides useful quantitative information on the environment impact of small watershed projects. (James-Geo Tech)

URBAN WATER SUPPLY CATCHMENTS: SOME ILLUSTRATIONS OF RESOURCE ALLOCATION AND CONFLICT REGULATION,
Macquarie Univ., North Ryde (Australia).
P. Crabb.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973, University of Newcastle, New South Wales, University of Newcastle Research Associates, Ltd, C. Aislabie, editor, p 19-23, 1973. 21 ref.

Descriptors: *Water allocation(Policy), *Watersheds(Basins), *Reservoir operation, *Water supply management, *Recreation, *Australia, Land use, Water quality control, Water sources, Water costs, Water pollution control, Regulation, Planning.
Identifiers: Adelaide(Aust), Mt. Lofty Ranges(Aust), Melborne(Aust).

The idea of using water catchments for purposes other than water supply has been gaining increasing favor especially in the United States and Britain where extensive recreational use is now being derived from catchment areas. In Australia three approaches to the management of catchment areas have been employed: the laissez-faire, the single purpose, and to a much lesser extent, the multi-purpose approach. The laissez-faire method amounts to minimal control over land and other

resource use. An example is the city of Adelaide which takes 20-50% of its public water supply from the River Murray with the remainder coming from a number of small catchments in the Mt. Lofty Ranges. The lack of control over catchment areas plus rapid development has caused a steadily decreasing water quality, which now violates standards set by the World Health Organization. Major deficiencies exist in color, taste, turbidity, odor and bacteriological quality. Recent measures to alleviate the problem have included regulation of further development, and the purchase of some reservoir land. Seven new treatment plants are being built at a total cost of $35 million, and a cost to consumers of $.85 per 1000 gallons. Melborne restricts use of the Upper Yarra and Watts River catchments solely to water supply; entry to the catchments is prohibited by law. This denies the aesthetic and recreational use of these scenic areas to the urban population which is exerting an increasing demand on water based leisure activities. The increased cost of multi-purpose catchments will reflect the current economic realization that water has for too long been sold at bargain prices. A safe public water supply is still the highest priority, but this does not exclude the use of catchments for a variety of other activities. (See also W74-11682) (LaPointe-North Carolina)

Emerging nations of Africa confront very unique problems in developing their water supply capabilities. Ethiopia, Kenya, Tanzania, Zambia, Malawi, and Rhodesia are situated on a ridge of high land stretching southwest from Ethiopia to the Cape Province of the Republic of South Africa. Rainfall is seasonal, and averages 20-40 in. per year with at least one long dry season. The best land for future development lies in the upland or highveld region, which necessitates pumping of water from lowland regions or construction of large dam sites. The indigenous population is transient, periodically moving from areas of drought to new regions of available food and water, complicating construction of a permanent water supply. Population growth is high and per capita incomes among the lowest in the world, making large scale capital investment difficult. Rhodesia, endowed with suitable engineering skills, serves as an example of some short run solutions that will permit development and industrialization. With seasonal rainfall, adequate storage capacity must be achieved close to the headwaters of rivers and streams. Salisbury, the capital, is supplied by a number of small dams and reservoirs and from Lake McIlwaine created by dam construction. The other major city, Bulawayo, situated on the edge of a desert will have to limit future growth if local water supplies are not augmented. Long range solutions for Rhodesia, i.e., construction of massive pipelines to pump water to the highveld, and a chain of dams along a major river involve such enormous capital outlays and operations costs as to be totally infeasible at present. In: Proceedings of the Urban Water Economics Symposium, April 28, 1973. University of Newcastle, New South Wales, University of Newcastle Research Associates, Ltd., C. Aislabie, editor, p 155-170, 1973. 16 ref, 1 append.

Descriptors: *Water demand, *Water management, *Regression analysis, *Economic efficiency, *Pricing, Marginal costs, Marginal benefits, Water use, Statistical methods, Correlation analysis, Domestic water.
Identifiers: Determinants of residential water use.

Because demand for water is believed to be very inelastic with respect to price, water supply economics have been viewed from a 'requirements' approach. Thus legal and physical measures of restricting water consumption have been favored over pricing for short run solutions with creation of additional water supply capacity favored for long term projected increases. Because of the current high and steadily increasing marginal cost of increasing supply, demand management based on marginal pricing policies is becoming a more attractive alternative. Such pricing policies can be formulated by separating out the determinants of demand by multiple regression analysis. A number of previous studies, using a wide range of variables, have yielded price elasticities from minus .2 to minus .5. Such an analysis for Australia might employ the following variables: (1) climatic condition and physical factors such as temperature, precipitation and evapotranspiration rate; (2) family income, in particular the type of housing, ownership of water using equipment, and the area of lawn and shrubs; (3) other household characteristics, like the number and age of persons in residence; (4) type of water service, as measured in number of taps, water pressure, and water quality; and (5) management approach, for example, metering, size of minimum bill, excess water charge, and imposed restrictions. Unfortunately data to fit this model is severely limited, and is painstakingly gathered; however if the importance of each variable could be determined, water demand management could economically influence water demand and more confidently time the construction of additional capacity. A NEW DIRECTION FOR URBAN INVESTMENT AND PRICING DECISIONS,
B.H.P. Co. Ltd., Port Waratah (Australia).
G. Walters.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973. University of Newcastle, New South Wales, University of Newcastle Research Associates, Ltd., C. Aislabie, editor, p 177-188, 1973. 12 ref.

Descriptors: *Water resources, *Water management(Applied), *Pricing, *Water costs, Water allocation, Elasticity of demand, Water distribution, Cost-benefit theory, Administrative costs, Water supply, Comparative costs, Economic efficiency, Fixed costs, Variable costs, Payment, *Australia.
Identifiers: Metering.

Flat rate pricing currently preferred in most of Australia's water supply systems encourages waste and provides little data about the benefits and costs of increasing supply. Using the statistical requirements approach to predict future consumption is unsatisfactory because it must assume constant costs for increasing water supply, and a perfectly inelastic demand. Metering, or use charging, has the benefits of reducing consumption (in the U.S.A. metering has reduced consumption by up to 50%) with the consequent deferment of capital expenditure and of providing useful information on price elasticities. These benefits are weighed against costs of installation and administration of a metered system, and loss of consumer surplus. Pricing metered water must incorporate consumer costs of meters, billing, and administration; the capacity costs of providing dams, mains, and reservoirs; and commodity costs of the consummables used in treatment and pumping. The American Water Works Association has

established a base rate for all users to cover consumer costs (fixed). Fifty percent of capacity costs are provided by the base rate and the remaining 50% plus the commodity (variable) costs are assessed by use. The block system of variable pricing (heavy users charged less) should be reexamined in light of the increasing scarcity of water and perhaps be made an increasing price scale instead of the decreasing one developed to encourage water use when water was plentiful. HYDROLOGY AND RECREATION ON THE COLD-WATER RIVERS OF MICHIGAN'S UPPER PENINSULA,
Geological Survey, Lansing, Mich.
G. E. Hendrickson, R. L. Knutilla, and C. J. Doonan.
Michigan Geological Survey Water Information Series Report 4, 1973. 39 p, 24 fig, 8 tab, 27 ref.

Descriptors: *Recreation, *Rivers, *Michigan, *Fishing, Scenery, Aesthetics, Water temperature, Water quality, Vegetation effects, Boating, Hydrologic data, Streamflow, Discharge(Water).

Recreational values of the cold-water rivers of Michigan's Upper Peninsula are dependent on streamflow characteristics, water quality, and character of channel, bed, and banks. All recreational values are generally benefited by relatively uniform streamflow, clear water free from objectionable contaminants, and forested river banks protected from excessive erosion. Trout populations may be limited by stream temperature, bottom vegetation, variability of streamflow, and discharge per unit drainage area. Preservation of recreational values of Upper Peninsula streams chiefly requires the control of manmade changes in the hydrologic environment. (Knapp-USGS)

PAYMENT BY USE IN URBAN WATER SUPPLY,
Newcastle Univ. (Australia).
C. J. Aislabie.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973, University of Newcastle, New South Wales, University of Newcastle Research Associates, Ltd, C. Aislabie, editor, p 1-18, 1973. 11 ref.

Descriptors: *Water demand, *Water supply, *Water utilization, *Pricing, *Cost-benefit analysis, *Water rates, Marginal costs, Constraints, Economics, Cost allocation, Water management(Applied), Elasticity of demand, Interest rates, Income, Economic impact.
Identifiers: Payment by use, Metering, Excessive use charges.

Cost-benefit analysis should be employed to determine whether the expenses incurred in metering individual water use outweigh the benefits derived. Such an analysis must include a specification of the objective function including the units employed; determination of the constraints, which might be policy constraints, political, resource target and/or imaginary constraints; elaboration of the feasible alternatives, realizing the distinction between decision and non-controllable variables; measurement of the costs and benefits of feasible alternatives; and evaluation and choice. Such an analysis could conceivably demonstrate that payment by use is the best alternative under particular circumstances. Marginal cost pricing would force public utilities to have an income less than their expenditure, and new investment would, therefore, be more in the bonds of the federal government. Rating methods encourage wastage of water and cause conflicts between urban and rural users. Rating methods with excessive use charges do eliminate some of the waste but suffer from the problem of very small revenue arising from the excessive use charges, a majority of the users often paying the minimum rate. While payment by use might encounter some difficulty in the selection of the proper social welfare functions, it does allow a gradual reduction in demand by price variation, which would be a short term alternative to installation of new capacity. Sensitivity to such price variation would have to be worked out on a case by case basis. (See also W74-11682) (LaPointe-North Carolina)

SOME ASPECTS OF URBAN WATER SUPPLY IN VICTORIA,
Victoria Water Commission (Australia).
R. W. G. Evans.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973. University of Newcastle, New South Wales, University of Newcastle Research Associates, Ltd, C. Aislabie, editor, p 61-67, 1973.

Descriptors: *Water supply, *Water resources development, *Water storage, *Water rates, Water quality, Pricing, Government finance, Water allocation(Policy), Water harvesting, Capital costs, Reservoirs, Reservoir construction, Reservoir storage, Pipes, *Australia.
Identifiers: Victoria(Australia), Plumatella.

Of the 420 towns in the State of Victoria, 270 have water supplies managed by local authorities, which receive government financial assistance, and are supervised by the State Water Commission. The following matters are considered before any capital works project is undertaken: (1) capacity of existing works; (2) pattern of likely future demand; (3) utilization of stage construction; (4) capital costs; (5) governmental financial assistance towards capital costs; (6) availability of capital funds; (7) local contribution; (8) rating and charging structures. Charging is usually based on a property tax, with separate minimum charges for houses and vacant lots. Industries may receive special bulk charge rates, and metering is encouraged where economically feasible. Periods of dry weather can exacerbate the conflict that exists between rural and urban users, and local water authorities are expected to devise storage facilities adequate to meet low flow needs. Under severe drought conditions water is allocated on a case-by-case basis, however domestic and stock use always takes precedence over irrigation. Proper design and construction of reservoirs and water mains can alleviate many water quality problems. Some solutions for water quality problems are: reservoirs banks should be cleared of all vegetation; multiple level outlets should be provided; sound land use policies should be employed around catchment areas; continuous chlorination should be used to prevent Plumatella growth in pipes; and careful housekeeping policies such as periodic flushing and cleaning of water mains should be regular maintenance operations. AN OPPORTUNITY COST FUNCTION FOR NEWCASTLE'S WATER,
New South Wales Dept. of Agriculture, Wollonghar (Australia). Agricultural Research Center.
D. P. Godden.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973, University of Newcastle Research Associates, Ltd, C. Aislabie, editor, p 78-79, 1973. 7 ref.

Descriptors: *Pricing, Water resources development, *Management, *Water harvesting, Water demand, Water rates, Roofs, Runoff, Water supply, Water supply development, Economic feasibility, Economic justification, Industrial water, Benefits, *Costs, Cost-benefit analysis, *Australia.
Identifiers: *Opportunity costs, Home-gathered water, *Newcastle(Aust).

Opportunity cost can be defined as the value of a given good in its best alternative use. In New South Wales industry is a significant water user and opportunity cost schedules based on industrial demand curves would not be difficult to prepare. Such schedules could then be used to establish a price dependent demand function for domestic water. This is one method of moving from the present 'requirements'-based pricing system to an economics-based system. (See also W74-11682) (LaPointe-North Carolina)

THE ECONOMICS OF DATA COLLECTION SYSTEMS,
New South Wales Inst. of Tech., Sydney (Australia).
A. Pattison.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973. University of Newcastle, New South Wales, University of Newcastle Research Associates Ltd., C. Aislabie, editor, p 119-144, 1973. 2 tab, 11 ref.

Descriptors: *Economic justification, Engineering, *Data collections, *Cost-benefit analysis, *Data processing, Data storage and retrieval, Data transmission, Reservoirs, Flood recurrence interval, Flood control, Flood data, Gaging, Design data, Design criteria, Planning, Water supply development.
Identifiers: Sensitivity analysis.

Very little work has been done on establishing an economic justification for data collection. Presently most data is collected over a short term time interval, with little attention to the benefits and costs of long term data gathering. The purpose of a data collection system is to furnish information upon which water supply, and system design criteria can be formulated. Two types of data are needed: socioeconomic concerning users' preferences and demands, and engineering such as hydrologic information, hydraulic characteristics and construction costs. Total costs for data gathering would be the total costs of data collection, processing, storage and retrieval. One way to relate costs of data to the benefits derived from improved design is to estimate the costs of an inferior design, as, for example, if insufficient data caused

an overestimation of reservoir capacity and a larger than necessary spillway was constructed. An underestimation of capacity, however, is more difficult to calculate because of the catastrophic flood damage that could result and possible loss of life. Sensitivity of flood flow prediction to flow data is very pronounced, a 100 year return period requiring 115 years of record to predict magnitude within 10% for 95% of the time. If only 30 years of record are available differences of minus 54% to plus 70% are possible. For a record of 10 years the range is minus 67% to 211%. A recent Canadian study, involving streamflow data, related estimation errors and time period of collection project expenditure. Similar analyses should be applied to all types of data used in urban water supply design and planning. (See also W74-11682) (LaPointe-North Carolina)

URBAN-RURAL CONFLICTS IN URBAN WATER SUPPLY,
University of New England, Armidale (Australia).
J. J. J. Pigram.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973. University of Newcastle, New South Wales, University of Newcastle Research Associates Ltd., C. Aislabie, editor, p 145-154, 1973.

Descriptors: *Water shortage, Water supply, *Water supply development, Water resources development, Water requirements, *Australia, Water users, Projections, Planning, Forecasting, Growth rates, Rural areas, Irrigation, Agriculture, Groundwater, Industrial water, Domestic water, Competing uses.
Identifiers: *Namoi River Basin(Aust), *Tamworth(Aust), Gunnedah(Aust), *Urban-rural conflicts.

The regional water resources of the Namoi River Basin, Australia, and either relationship to the water supply-demand situation for the urban centers of Tamworth and Gunnedah are surveyed. Tamworth, with a population over 24,000, serves as a regional capital for much of the Namoi Region. Present rapid growth could be hampered in the future by an inadequate water supply. In 1970, 1300 million gallons were consumed, 75% in domestic use, 25% by industry, and less than 1% by railroads. Irrigation water is supplied by over 50 wells, and future wells are planned. Of four proposed solutions for future surface water supply, a decision was made in 1971 to construct an earth and rockfill dam at Bowling Alley Point, with scheduled completion by 1979 at a cost of $8 million. Tamworth will receive 25% of average annual yield. Gunnedah (population 8000) relies solely on groundwater for urban water supply, utilizing two wells and six bores with a maximum capacity of 185,000 gallons per hour. High evapotranspiration makes per capita consumption high, at 165-200 gallons per day. By 2000, a projected population of 15,000 will require in excess of 1400 million gallons per year. The only reasonable surface supply is Keepit Dam, now used solely for agricultural purposes. Competition for this water appears inevitable, especially if one of the Valley centers is selected as a regional growth center. Due to the importance of water in the Namoi Valley, total planning for future allocation between competing uses is essential, and such planning should weigh not only economic development, but also the noneconomic considerations such as aesthetic values and wilderness conservation. RURAL AND URBAN FLOOD INSURANCE: A REVIEW,
New South Wales Dept. of Agriculture, Sydney (Australia).
G. A. Forsythe.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973, University of Newcastle, New South Wales, University of Newcastle Research Associates Ltd, C. Aislabie, editor, p 68-75, 1973. 9 ref.

Descriptors: *Floodplain insurance, *Flood protection, *Flood damage, *Flood control, Risks, Cost-benefit ratio, Economies of scale, Regional development, Cost sharing, Cost allocation, Land use, Land management.
Identifiers: Insurance premiums, Mandatory insurance.

Structural measures for flood mitigation can lead to inefficient floodplain land use by giving landowners a false sense of security. In many cases such structural measures are not consistent with environmental quality. Floodplain insurance offers a reasonable alternative with some advantages. Insurance will ease the landowner's burden of flood damage. If premiums are accurately related to rules involved, maximization of the benefits of floodplain land should result, with the occupant aware of the risks he is incurring. The cost of structural measures is usually borne by the general public; however insurance premiums could be used to finance such construction, and thus the cost would be paid directly and solely by the major beneficiaries. The major disadvantage with floodplain insurance is the difficulty of viable operation in actuarial sense. Since a flood effects almost all the residents in the floodplain, damage claims can be many and large. This prevents averaging out the claims with the premiums, and could lead to extremely high premiums for reinsurance. This disadvantage could be alleviated by governmental backing or by policies taken out for extended time periods covering many floodplains. Mandatory full flood plain insurance would lower premiums by reducing sales costs, but would discourage policy holders from investing in structural controls. SAMPLING ERRORS IN FLOOD DAMAGE ESTIMATES,
New South Wales Univ., Kensington (Australia).
B. W. Gould.
In: Proceedings of the Urban Water Economics Symposium, April 28, 1973, University of Newcastle, New South Wales, University of Newcastle Research Associates Ltd, C. Aislabie, editor, p 82-98, 1973. 6 fig, 2 ref, 2 append.

Descriptors: *Flood damage, *Flood protection, *Flood plain insurance, *Statistical methods, *Risks, Estimated costs, Estimated benefits, Cost-benefit analysis, Mathematical studies, Sampling, Flood frequency, Flood flow, Estimating, Engineers estimates.
Identifiers: Simpson's rule, Sampling bias, Insurance premiums.

A cost-benefit analysis of a flood mitigation project or a flood insurance policy must consider the costs of project construction and operation and benefits of estimated reduction in flood damage. While there may be some error inherent in accurate projection of costs, engineering cost estimate procedures can be expected to yield a reasonable estimate. Somewhat more difficult is estimation of annual damage risk. Two sets of data must be considered: damage vs. flood height, and flood height

vs. frequency. In estimating insurance premiums, f the value of the property is known, a survey of he area and flow data are used to develop a damage risk curve (total annual damage vs. proba- bility of exceedence). Integration of this curve hen yields the estimated risk. Data inaccuracies cause errors of estimate, however even greater er- rors are produced by the statistical sampling nethodology. A series of experiments conducted using somewhat simplified frequency damage rela- ionships showed that an increment size of 0.3 imes the standard deviation gave a sufficient degree of accuracy (following Simpson's rule), and that samples generally slightly over-estimated he damage. Another source of error, malfunction of drainage systems, is not believed to be amena- ble to mathematical prediction. (See also W74-11682) (LaPointe-North Carolina)

ON A FLOOD PLAIN: CAN A RIGHT GO WRONG,
Office of the Chief of Engineers (Army), Washing- ton, D.C.
G. R. Phippen.
Water Spectrum, Vol 6, No 1, p 31-37, 1974. 7 fig, 1 tab.

Descriptors: *Floodplain zoning, *Floodplain insurance, *Flood damage, *Flood control, *Land use, Floodplains, Properties, Flood protection, Property values, Land classification, Land management, Tax rates, Regulation, Legal aspects, Legislation, Constitutional law, Flood recurrence interval, Flow resistance, Compensation.
Identifiers: Intermediate Regional Flood.

Uncontrolled development of floodplains often results in severe individual losses and a shifting of individual losses to others, with subsequent losses of community services, higher flood levels brought about by impeded flow, encroachment on productive fish and game habitats, and high costs of relief efforts. Because of these larger effects on the broader population, recent efforts to control floodplain development have been vigorous. Such efforts seek to promote the public welfare by minimizing flood losses while at the same time protecting private property rights. The basis of development regulation rests in two Supreme Court decisions in the 1920's. The court held that while zoning laws were a legal application of police power individual ordinances were still subject to attack. Recent State Supreme Court decisions have tended to favor the landowner in proportion to the degree of restrictiveness. Floodplain zoning tends to regulate land use patterns rather than use per se. One way to discourage floodplain development is by taxing policies which consider the community losses emanating from a flood. The Federal Government, through the National Flood Insurance Program, requires land use controls for eligibility. The Corps of Engineers now considers needed flood plain regulations as prerequisites for local cooperation prior to Federal investment, and suggests the 100 year Intermediate Regional Flood as a planning base. Increased interest in flood hazard information supplied to Federal agencies and those seeking Federal financial aid by the Corps of Engineers as well as increasing urban-suburban interest in flood plain management point up an ever growing awareness of the need for new land use regulations in the definable floodplain. FLOOD PLAIN MANAGEMENT IN METROPOLITAN CHICAGO,
Metropolitan Sanitary District of Greater Chicago, Ill.
R. Lanyon.
Civil Engineering-ASCE, (American Society of Civil Engineers), Vol 44, No 5, p 79-81, May, 1974. 2 fig, 1 tab.

Descriptors: Flood plains, *Flood control, *Sewer systems, *Land use, *Flood damage, Flood plain zoning, Water management(Administrative), Governments, Legislation, Hydrologic aspects, *Illinois, Cities, City planning.
Identifiers: *Flood plain management, Technical information, Public control, *Chicago(Ill).

Planning is now underway with cooperation of many levels of government to control land use and flooding in the Chicago area. This flooding was divided into three categories: basement and below grade flooding due to back-up of sanitary sewers from floodwater entering sewer systems through flood and street manholes; direct entrance of surface floodwaters into lower level garages, basements, and subgrade surface living areas; inundation of the above grade frame portions of the structure. Besides such residential damage, municipal flooding occurs on parking areas, playgrounds, highways, and streets. A watershed plan was developed to reduce flood damages and erosion. Two remaining undeveloped flood plain areas were to be placed in public control with the intention of enforcing ordinances against new developments in identified flood hazard areas and the enacting of a technical assistance program to provide floodproofing information where hazards exist. ENVIRONMENTAL STATEMENTS AND WATER RESOURCE PLANNING IN NORTH CAROLINA,
North Carolina Univ., Chapel Hill. Dept. of City and Regional Planning.
M. M. Hufschmidt.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 265; $4.75 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleigh, Completion Report No 94, (UNC-WRRI-74-94), June 1974. 127 p, 6 fig, 4 tab, 55 ref, 3 append. OWRTA-063-NC(1). 14-31-0001-3833.

Descriptors: *North Carolina, *Planning, Regulation, Legislation, *Environmental effects, State governments.
Identifiers: New Hope Lake(NC), Falls of the Neuse(NC), Mills River(NC), Chicod Creek(NC), National environmental policy act, *Environmental impact statements.

The National Environmental Policy Act of 1969 (NEPA) and the 1971 North Carolina Environmental Policy Act have had significant consequences for North Carolina water resources, particularly through their requirements for environmental impact statements (EIS). All EIS flow through a clearance procedure for Federal, State and local public agencies and citizens' groups review and comment. The procedure is working effectively in North Carolina and has resulted in some changes in timing and/or design of a number of water resource projects. In part this has been the result of suits brought in Federal Courts by environmental and local interest groups on a few projects. Equally significant, the environmental statement requirements of NEPA have led to major changes in agency planning procedures in which environmental factors are considered from the earliest stages of planning and public participation is emphasized. Such changes have been made by Federal and State water resource, highway and nuclear power planning agencies. The quality of environmental statements prepared for North Carolina projects, initially poor, has been improving as agencies have gained experience in environmental analysis and as greater resources have been applied to the task. This report summarizes the environmental impact statements prepared on water resources and water resource related projects during 1970-1974, summarizes and evaluates their effectiveness and presents recommendations for improvements in the process. AMES RESERVOIR ENVIRONMENTAL STUDY. APPENDIX 1 - VOL. 2. NATURAL AND ARCHAEOLOGICAL RESOURCES OF THE RESERVOIR SITE AND STREAM SYSTEM,
Iowa State Water Resources Research Inst., Ames.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 400, $27.25 in paper copy $2.25 in microfiche. Report ISWRRI-60-A1-Vol 2, 1973. 449 p, 59 fig, 43 tab, 269 ref. OWRT A-999-IA (8a).

Descriptors: *Reservoir construction, *Reservoir sites, *Environmental effects, Iowa, Biological communities, Ecology, Postimpoundment, Preimpoundment, Alternate planning, Archaeology, Wildlife, Habitats, Ecological distribution, Limnology, Fish populations, Vegetation effects, Vegetation, Forest watersheds, Geologic investigations, Geologic mapping, Ecosystems, Reservoirs.
Identifiers: *Skunk River Basin(IA), *Ames Reservoir(IA), Coralville Reservoir(IA).

Implications of the proposed Ames Reservoir in Iowa are discussed in connection with the upper Skunk River's landscape, vegetation, geology, limnology, wildlife, fisheries, and archaeological resources before the construction of the reservoir and post-construction effects. The reservoir will cause dramatic changes in the region's vegetation; 2100 acres will be permanently inundated with an additional 5000 acres within the maximum flood pool level. Nearly two-thirds of the woodland area and volume along the river will be affected. Most of the decidious and flood plain trees will be destroyed. Large areas of the flood plain will be turned into mud flats dominated by smartweed. The resultant simplified plant community will generally be unable to buffer organic material, nutrients, and soil to the aquatic system. The combination of relative long turnover rates and nutrient levels means that the impoundment's water will be very fertile. Specialized species, top trophic levels, and particular food chains may be eliminated from the terrestrial vertebrate community. Twenty-eight of the existing fish species will be lost, with detritus, plankton, and rough fish representing a large portion of the remainder. Nearly all of the archeological sites located in the region will be affected as 23 will be destroyed and 28 seriously damaged. (See W74-11580 thru W74-11585) (Schroeder-Wisconsin)

Descriptors: *Environmental effects, *Reservoir construction, *Vegetation, Preimpoundment, Postimpoundment, Mud flats, Vegetation establishment, Water level fluctuations, Census, Reservoir sites, Spatial distribution, Lumber, Forests, Trees.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Impacts of Iowa's proposed Ames Reservoir on the vegetation cover are reviewed. A 1972 inventory of existing vegetation utilizing five vegetation communities and land surface categories was conducted through aerial photography and field surveys over the 22,000 acre site. While individual species distributional cover was not obtained species dominance was observed, showing a wide diversity of plant communities. Transect sketches are provided to visualize the location and characteristics of various plant categories within the study area. Graphic depictions produced by computer provide estimates of surface and vegetation characteristics and mud flat areas in the area of the proposed reservoir and five alternative project designs. The reservoir will drastically change vegetative characteristics losing 2100 acres in the conservation pool and placing 5000 acres within the area of the maximum flood pool. Results of the forest inventory are treated separately with emphasis on total standing timber rather than species composition. Almost one-seventh of the woodland area and volume in Story County and two-thirds of that along the Skunk River will bw seriously affected. Tree varieties highly tolerant to inundation are discussed; black willow, green ash, and cottonwoods are especially flood tolerant. (See also W74-11579) (Schroeder-Wisconsin)

Descriptors: *Iowa, *Reservoir construction, *Archaeology, Reservoir sites, Environmental effects, Flooding, History.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), Anthropology.

Archaeological investigations of the upper Skunk River, site of the proposed Ames Reservoir, suggest that the area was occupied prior to Euro-American settlement. Artifacts collected through preliminary surficial surveys indicate the presence of prehistoric camps, settlement sites, quarries, collecting stations, and other activity areas in the Woodland, Post-Woodland and Archaic traditions. The proposed reservoir poses a serious threat to nearly all of the existing archaeological sites in the region. Twenty-three will be immediately and totally destroyed by construction activities, permanent inundation and pool wave action. Thirteen other sites will suffer partial destruction because of intermittent inundation and wave action. Seven sites, although not within the reservoir per se, will be included in land acquisition to be developed into recreational areas. Activities in the easement area and immediately adjacent the reservoir pose threats of damage to eight additional sites. Construction of the proposed reservoir increases the prospects that a key to understanding the life and cultures of an ancient people may be lost. Site salvage programs should be instituted to rescue the data for the reconstruction of a more definitive cultural-historical sequence of the area. (See also W74-11579) (Schroeder-Wisconsin)

In: Ames Reservoir Environmental Study. Appendix 1 - Vol 2. Natural and Archaeological Resources of the Reservoir Site and Stream System, Iowa State Univ. Report ISWRRI-60-A1-Vol 2, 1973, p 1-7-i--1-7-82. 21 fig, 13 tab, 174 ref.

Descriptors: *Ecosystems, *Reservoir sites, *Environmental effects, *Biological communities, Ecology, Dominant organisms, Distribution patterns, Postimpoundment, Preimpoundment, Iowa, Reservoir construction, Plant populations, Habitats, Animal populations, Rivers, Water level fluctuations, Fish, Ecological distribution, Vegetation, Systematics, Flood plains, Food webs.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA), Coralville Reservoir(IA), Iowa River, Trophic structures.

Studies were conducted at Iowa's proposed Ames Reservoir site and the existing Coralville Reservoir to project the extent of ecosystem disruption that will occur at the Ames site. Quadrants were set up at the two sites and a lowland prairie and samples taken from each to determine the disruption of the plant community. Presently much of the Skunk River Basin, site of the proposed project, contains deciduous and flood plain trees which will be destroyed by the impoundment. Large areas of this flood plain will be turned into mud flats dominated by ruderal, a form of plant community generally unable to buffer the nutrients, organic materials, and soil to the aquatic system. In the terrestrial vertebrate community specialized species, top trophic levels and particular food chains may be eliminated and small mammals and their predators, often found in the meadows and fields to be inundated, will be rare or nonexistent. Twenty-eight out of 38 species of fish presently found in the area to be flooded will be eliminated with a return to highly generalized species; species surviving the inundation will be detritivorous, planktivorous or omnivorous. Species lists of the plant and animal communities examined are provided. (See also W74-11579) (Schroeder-Wisconsin)

In: Ames Reservoir Environmental Study. Appendix 4. Physical Relationships With the Agricultural Sector, Iowa State Univ. Report ISWRRI-60-A4, 1973, p 4-2-i--4-2-44. 2 fig, 10 tab, 34 ref.

Descriptors: *Farm management, *Fertilizers, *Water pollution sources, Nutrients, Leaching, Nitrates, Phosphates, Translocation, Iowa.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

The impact of agricultural fertilizers on the water quality of Iowa's proposed Ames Reservoir is considered with primary emphasis on nitrogen and phosphorus levels. The Skunk River watershed, site of the proposed reservoir, is a relatively level, recently glaciated area, with little drainage way development, except near major streams. Nearly all of the level land is tile drained. The project area is heavily cropped with 70-75% of the watershed tilled and 90-95% of the tilled land in corn and soybeans. Fertilizer application in the region is 10-20% above the Iowa average. A 1972 systematic sampling and analysis of the Shunk River indicated nitrate-N levels from 3 ppm in April to over 10 ppm in the remainder of the year; ammonia-N concentration levels ranged from 4 ppm during snowmelts to less than 1 ppm the remainder of the year; and phosphate-phosphorus levels varied from 0.12-0.83 ppm with the highest during snowmelt. Tile effluent and subsurface ditch bank seepage were apparently the primary sources of nitrate-N in the river in 1972. About 2 lbs/ac of organic N (sediment) and about 0.8 lb/ac of P in particulate matter were added to the flow. BOD concentrations at one sampling station varied from 2.2 - 7.1 ppm. J. L. Baker.
In: Ames Reservoir Environmental Study. Appendix 4. Physical Relationships With the Agricultural Sector, Iowa State Univ. Report ISWRRI-60-A4, 1973, p 4-3-i--4-3-26. 1 fig, 2 tab, 44 ref.

Descriptors: *Pesticides, *Herbicides, *Insecticides, Fishkill, Persistence, Pesticide toxicity, Pesticide kinetics, Path of pollutants, Farm management, Iowa, Application methods, Biodegradation, Reservoirs, Water pollution sources.
Identifiers: *Ames Reservoir(IA), *Skunk River Basin(IA).

Farmers' decisions concerning the type, level, and form of pesticide and herbicide application, the susceptibility of non-target organisms to these chemicals and the effectiveness of various transport mechanisms (TM) which disperse and change their chemical forms often have significant impacts on water quality and potential environmental damage. TM, including runoff and volatilization, depend on the physical and chemical properties of the pesticide as well as application and associated tillage practices. To illustrate the implications of various insecticides and herbicides on the environment, a number of Iowa based recent chemical studies are summarized. In general, the chlorinated hydrocarbon insecticides evaluated were practically insoluble in water and generally not susceptible to chemical breakdown. They are very persistent and although found in low concentrations in water are highly concentrated in the organic matter associated with the soil. Organophosphorus and carbomate insecticides are less persistent or toxic to fish, but are highly toxic to mammals. Recent EPA directives have led to greater use of these forms. Herbicides examined have low mammalian toxicity, are used in low dosages, generally have a shorter half-life, and may pose a less serious threat to the environment than the insecticides. SYMPOSIUM ON HYDROMETRY, VOLUME I AND II.
Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, 1973. 892 p (total of volumes I and II).

Descriptors: *International hydrological decade, *Water measurement, *Hydrometry, *Stream gages, *Gaging stations, Instrumentation, Data collections, Basic data collections, Hydrologic data, Data processing, Flow measurement, Discharge measurement, Conferences.

This symposium on hydrometry was organized in cooperation with the World Meteorological Organization, the International Association of Hydrological Sciences and the National Committee for the International Hydrological Decade of the Federal Republic of Germany. The scientific program of the symposium covered the following main subjects: measurement of water stages and discharge; measurement of depth, temperature and water quality; measurement of solid matter transport; special techniques, including recording and teletransmission of data; and evaluation of measured data. (See W74-11494 thru W74-11567) (Knapp-USGS)

THE ANALYSIS OF FLOAT AND HYDROSTATIC LEVEL GAUGES AND THE CHOICE OF OPTIMAL VALUES OF THEIR BASIC ELEMENTS,
Gusudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
A. M. Dimaksian.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 3-10, 1973. 2 fig, 2 ref.

Descriptors: *Water levels, *Gages, *Instrumentation, Calibrations, Telemetry, Measurement, Data collections, Hydrologic data, Flow measurement, Discharge measurement, International hydrological decade.
Identifiers: USSR.

Optimum conditions for the operation of float water-level recorders are attained when the equilibrium of the system is disturbed only within strict limits during the rise or fall in the water level. It is possible to select a given accuracy and a specified range of measurements at the basic design stage. Analysis of the operation of hydrostatic level gages shows that their greatest error lies within 1 cm of water level. (See also W74-11493) (Knapp-USGS)

DIGITAL RECORDING OF WATER LEVELS WITH THE AID OF ACOUSTICS AND ITS APPLICATION TO HYDROLOGICAL PUMPING TESTS,
Bundesanstalt fuer Bodenforschung, Hanover (West Germany).
H. J. Durham, and R. Kohlmeier.

In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 11-30, 1973. 13 fig, 4 ref.

Descriptors: *Aquifer testing, *Instrumentation, *Water levels, *Acoustics, *Drawdown, *Measurement, Computer programs, Data collections, Data processing, Hydrologic data, International hydrological decade.

A new method is proposed for aquifer testing. In pumping tests, the desired data can frequently be obtained only at considerable expense and effort. In most cases, manual recording involves high labor costs and yields few and insufficiently accurate measurements. Detailed evaluation requires an extremely long time. To overcome these difficulties by modern techniques, an automated measuring method was chosen. Ultrasonic vibrators acting as transmitters and receivers are suspended motionless in the water at the groundwater observation points. The transit time of an ultrasonic pulse travelling from the vibrator to the water surface and back is measured with the aid of an extremely accurate microchronometer. The resolving power is about 1 mm. The distances between vibrator and water surface are measured in sequence and recorded (as transit time), together with date and hour of the measurement and the number of the measuring point, on punched tape. From the punched tape, the data are transferred to a magnetic disc where they are available for direct use by the computer. The drawdown curves are graphically and numerically evaluated with the aid of computer programs. (See also W74-11493) (Knapp-USGS)
W74-11495

HYDROMETRIC STATIONS IN ARID ZONES,
Ministry of Agriculture, Jerusalem (Israel). Hydrological Service.
D. Kornitz.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 31-40, 1973. 5 fig.

Descriptors: *Water measurement, *Instrumentation, *Basic data collections, Gages, Telemetry, Flow measurement, Hydrologic data, Data collections, Discharge measurement, Hydrometry, Arid lands, Water resources development, International hydrological decade.
Identifiers: *Israel.

Collection of hydrometric data required for national development plans is being pursued vigorously in Israel. In the arid zones of southern Negev, where many hydrometric stations have been established, serious problems have arisen. Visits to these remote measuring sites are possible only in good weather, and even then mostly by air transport. No direct measurements of discharge or manual collection of water samples is possible during flash floods caused by sudden storms. Sand and dust storms may influence the performance of the instruments. Bed-load and silt clog the intakes of stilling wells. The equipment and instrumentation should therefore be capable of operating satisfactorily over long periods, unattended and under adverse climatic conditions. A strip chart water-level recorder with battery-driven clock mechanism works unattended for periods up to 12 months. Water-level fluctuations are recorded in a stilling well by means of a float. Water levels can be transmitted by electronic means (using stream gages). Automatic water-sampling bottles are filled at different stages on the rising and falling limb of the flood-wave. (See also W74-11493) (Knapp-USGS)
W74-11496

A PORTABLE WATER-STAGE RECORDER FOR EXPERIMENTAL HYDROLOGICAL MEASUREMENTS,
Hydraulic Research Inst., Prague (Czechoslovakia).
J. Martinec.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 41-45, 1973. 4 fig, 3 ref.

Descriptors: *Water measurement, *Gages, *Telemetry, *Instrumentation, Alpine, Basic data collections, Hydrologic data, Data collections, Glaciers, Runoff, Flow measurement, Discharge measurement, International hydrological decade.

Hydrological studies must often be carried out at sites where accurate recording of water-level fluctuations cannot be ensured by the permanent network of water-gaging stations. A light, portable water-stage recorder was developed to synchronize measurements of hydraulic parameters on representative river reaches for research on flow conditions in reservoirs and for investigations of glacier runoff in remote areas. (See also W74-11493) (Knapp-USGS)
W74-11497

WATER-LEVEL TRANSDUCERS,
Hydrological Services Ltd., Sydney (Australia).
D. J. Sherlock, R. L. Hitchcock, and H. L. Stark.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 46-62, 1973. 9 fig, 1 ref.

Descriptors: *Water levels, *Water measurement, *Gages, *Australia, Data collections, Basic data collections,, Instrumentation, Stream gages, Discharge measurement, Gaging stations, Hydrologic data, Flow measurement, International hydrological decade.

Two water-level transducers were developed to meet the unusual conditions that are frequently encountered in Australian rivers. In the Sherlock Pressure Sensing Unit, pressure changes in the system impose a load on one side of a balanced beam. This load is balanced by the movement of a weight on a screw actuated by a servo-motor in a follow-up system, which also actuates the recorder. In its standard form, the unit can handle a range of heads up to 70 feet with a sensitivity of 0.01 feet throughout the range. Higher range instruments are also available with a corresponding reduction in sensitivity. In Australia the variety of the climate, range of river level, the variability of streamflow and the remote locations of many gaging stations present conditions which until very recently were beyond the capacity of any available water-level recording equipment. In 1960, the Irrigation and Water Supply Commission, Queensland, evolved a gas-electric transducer which successfully produces continuous records of river level, over ranges in height up to 100 feet in a wide variety of climate conditions, with normal service visits at 6-month intervals. (See also W74-11493) (Knapp-USGS)
W74-11498

STREAM GAUGING NETWORK OF THE LOWER MEKONG BASIN,
National Energy Authority, Bangkok (Thailand).
V. Taweesup.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 63-68, 1973. 1 fig.

Descriptors: *Water measurement, *Rivers, *Stream gages, *Gaging stations, Networks, Data collections, Hydrologic data, Basic data collections, Water levels, Instrumentation, Discharge measurement, Flow measurement, International hydrological decade.
Identifiers: *Mekong River, *Thailand, *Viet-Nam.

A hydrological network was initiated in the lower Mekong basin in February 1959, and in 1973 there were 24 stream-gaging stations on the main stream of the Mekong river and 200 gaging stations in the basin, including its tributaries in four riparian countries. Of these 24 gaging stations, 10 stations are operated by Thailand. The remainder are in Cambodia, Laos and Viet-Nam. Twenty of these stations have automatic stage recorders. (See also W74-11493) (Knapp-USGS)
W74-11499

WATER-LEVEL GAUGING BY PRESSURE MEASURING,
North Rhine-Westfalen Ministry for Food, Agriculture and Forest, Duesseldorf (West Germany).
R. Zayc.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 69-75, 1973. 4 fig.

Descriptors: *Stream gages, *Instrumentation, *Water levels, Gaging stations, Pressure, Telemetry, Basic data collections, Hydrologic data, Flow measurement, Water measurement, Discharge measurement, International hydrological decade.
Identifiers: *Germany.

A pressure transmitting gage for measuring water levels was developed in West Germany and has been used successfully for several years at gaging stations. The maximum measurable range of water-level fluctuation for this type of gage is up to 200 meters. The precision depends on the amplitude to be measured. For up to 10 meter water-level fluctuations, an accuracy of 1 cm can be obtained. In measuring smaller amplitudes, the precision can be improved to several millimeters. (See also W74-11493) (Knapp-USGS)
W74-11500

THE ANALYSIS OF THE POSSIBILITIES OF CURRENT METER OPERATION IN TURBULENT STREAMS,
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
P. N. Burtsev, and M. M. Baryshnikova.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 79-85, 1973. 3 fig.

Descriptors: *Current meters, *Instrumentation, *Water measurement, Calibrations, Turbulent flow, Hydrologic data, Basic data collections, Streamflow, Turbulence, Flow measurement, Discharge measurement, International hydrological decade.
Identifiers: *USSR.

Current meters in operation in hydrometric networks in the USSR are reviewed. Special attention is paid to the analysis of the influence of turbulent flow upon the readings of current meters under different working conditions (rod or cable suspension). Some recommendations are given concerning the application of current meters, depending on the hydrodynamic properties of the watercourses and operational practice; probable errors for different types of current meters are discussed. (See also W74-11493) (Knapp-USGS)
W74-11501

ACCURACY OF CURRENT METER MEASUREMENTS,
Geological Survey, Washington, D.C.
R. W. Carter.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Associa-

tion of Hydrological Sciences Publication No 99, Vol I, p 86-98, 1973. 2 fig, 6 tab, 4 ref, append.

Descriptors: *Current meters, *Basic data collections, *Calibrations, Statistics, Statistical methods, Instrumentation, Data collections, Water measurement, Hydrologic data, Flow measurement, Discharge measurement, International hydrological decade.

The probable accuracy of a streamflow measurement made by current meter may be assessed by evaluating the separate error components. Nonrandom error components are: (1) errors in the current meter rating; (2) the error of velocity observation at a point; (3) the error from measuring velocity only at selected points in a vertical; and (4) the error from assuming that the depth and velocity vary linearly between stations in the cross-section. Values for each of these error components are known, based on statistical analysis of special measurements made for this purpose on many different streams. Statistical combination of these errors indicates that the prabable error of a streamflow measurement made by the standard procedures is about 2 percent. This information can be used to determine the optimum observation procedure to attain a desired accuracy. (See also W74-11493) (Knapp-USGS)
W74-11502

CALIBRATION OF CURRENT METERS IN A SUBMERGED JET,
Geological Survey, Washington, D.C.
J. Davidian.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 99-108, 1973. 4 fig, 1 tab, 3 ref.

Descriptors: *Calibrations, *Current meters, *Jets, *Water measurement, *Instrumentation, Hydrologic data, Basic data collections, Flow measurement, Discharge measurement, International hydrological decade.

The feasibility of calibrating current meters in the submerged jet issuing from a cone-like nozzle was investigated. Preliminary tests have shown that this rapid method is of acceptable accuracy and that it could lead to savings in manpower, construction, and maintenance costs. The uniformity of the velocity field in the jet was verified for velocities between 0.25 and 8.0 feet per second. The repeatability of the operation of regular Type AA and Pygmy Price meters was satisfactorily demonstrated. The performance of each meter in the jet, compared to the conventional towing-tank rating of that meter, was within rating tolerances presently accepted. The design of the test facility and desirable design criteria for a permanent structure are described, including dimensions of the forebay, nozzle, and tailbox. The flow recirculation system and flow measurement facilities are discussed. (See also W74-11493) (Knapp-USGS)
W74-11503

THE MAGNITUDE OF ERRORS AT FLOW MEASUREMENT STATIONS,
Water Resources Board, Reading, (England).
R. W. Herschy.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 109-131, 1973. 3 fig, 4 tab, 7 ref, append.

Descriptors: *Water measurement, *Flow measurement, *Calibrations, Statistical methods, Hydrologic data, Data collections, Basic data collections, Stage-discharge relations, Discharge measurement, International decade.

An assessment of the accuracy of hydrometric data produced from flow measurement stations is important to the users of the data. This is particularly so in the case of water resources development. A statistical approach and simple statistical methods for obtaining the error in a single determination of discharge at both velocity-area stations and at weirs and flumes are given. A method is presented for obtaining the standard error of the stage-discharge curve. A statistical test for significance of check gagings is demonstrated. Statistical definitions as they apply to hydrometry are included. (See also W74-11493) (Knapp-USGS)
W74-11504

INSTRUMENTS FOR MEASUREMENT OF CURRENTS AND LEVELS IN NATURAL RESERVOIRS AND RIVERS,
Nauchno-Issledovatelskii Institut Gidrometeorologicheskogo Priborostroeniya, Moscow (USSR).
G. K. Popandopulo.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication, No 99, Vol I, p 142-148, 1973. 3 fig.

Descriptors: *Water measurement, *Current meters, *Stream gages, *Water levels, *Telemetry, Instrumentation, Stage-discharge relations, Basic data collections, Hydrologic data, Flow measurement, Discharge measurement, International hydrological decade.
Identifiers: USSR.

The current recorder used in the USSR is designed for the measurement of current speed and direction to a depth of 300 m. The operating principle of the instrument is based on the transformation of current speed and direction into electric pulses transmitted by cable to recorder. Special features of the instrument are the absence of cable twisting when reading the instrument, the absence of motion when taking readings, and a special pulley which permits automatic measurement of discrete current directions and gives the mean direction every three minutes. The hydrostatic level sensor has a pneumatic communication line. The operating principle is based on the transformation of hydrostatic pressure into pneumatic pressure by means of a power compensation system, the output being shown on the potentiometer. Its distinctive features are the high level of accuracy, with scales ranging from 1 m to 12 m, and the all-metal construction of the pneumatic system which ensures high sensor reliability and stability. (See also W74-11493) (Knapp-USGS)
W74-11505

FLOW MEASUREMENT OF SOME OF THE WORLD'S MAJOR RIVERS BY THE MOVING-BOAT METHOD,
Geological Survey, Washington, D.C.
G. F. Smoot.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication, No 99, Vol I, p 149-161, 1973. 5 fig, 5 tab, 3 ref.

Descriptors: *Flow measurement, *Stream gages, Instrumentation, Boats, Water measurement, Rivers, Current meters, Data collections, Hydrological data, Basic data collections, Discharge measurement, International hydrological decade.
Identifiers: Moving boat method.

A method for the rapid measurement of flows of large rivers and tidal reaches uses a moving boat. In this method, data are collected at a number of observation points while the observer is aboard a small boat that is rapidly traversing the cross-section. This technique is particularly useful at remote sites where no measuring facilities exist, during floods when facilities may be inundated or inaccessible, or at locations where unsteady flow conditions require rapid measurements. Flow measurements made at various sites using the moving-boat technique are summarized. Included are results obtained on two tidal reaches and such major rivers of the world as the Amazon, Mississippi, and Mekong. Where information is available, these measurements are compared with concurrent measurements obtained by conventional methods and agreement is generally within 5 percent. (See also W74-11493) (Knapp-USGS)
W74-11506

PROBLEMS IN THE DESIGN OF MEASURING STRUCTURES,
Research Inst. for Water Resources Development, Budapest (Hungary).
O. Starosolszky.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication, No 99, Vol I, p 162-168, 1973. 3 fig.

Descriptors: *Flow measurement, *Discharge measurement, *Stream gages, *Gaging stations, *Calibrations, Design, Duration curves, Weirs, Instrumentation, International hydrological decade.
Identifiers: Hungary.

Head-loss, operating costs of measurement, tailwater submergence and the mean error of water volumes determined on the basis of observed rates of flow are the major aspects required in the design of structures for continuous flow measurement. If the effect of submergence and the original rating curve of the channel are determined, the free-flow structure causing the smallest head-loss can be designed using the semigraphical method described. Submergence causes an error, the magnitude of which can also be estimated from the duration curves. The method is illustrated by an example. (See also W74-11493) (Knapp-USGS)
W74-11507

THE EVALUATION OF DISCHARGE MEASUREMENTS IN STREAMS WITH CHANGING FLOW CONDITIONS,
Board for Water Resources Management, Luneburg (West Germany).
K. Bellin.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 169-180, 1973. 7 fig.

Descriptors: *Flow measurement, *Discharge measurement, *Stage-discharge relations, *Hydrograph analysis, Backwater, Discharge coefficient, Hydrologic data, Water levels, Stream gages, Basic data collections, International hydrological decade.

Discharge is measured in streams with constantly changing flow conditions, but measurements are usually discontinuous. The discharge hydrograph for the time interval between two measurements is obtained from the stage hydrograph by means of the stage discharge curve. Widely scattered values obtained for the stage discharge relationship may be caused not only by weed conditions but also by moving sand, bank erosion or backwater. With the aid of the improved Gils method, an obstruction factor is derived from the fluctuations of the measured values which is representative of the water's discharge behavior at the time of measurement. A hydrograph describes the changes in discharge as caused by these changes during a discharge period. (See also W74-11493) (Knapp-USGS)
W74-11508

FLOW MEASUREMENT BY THE INTEGRATING FLOAT METHOD.
Missouri Univ., Columbia. Dept. of Civil Engineering.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 188-196, 1973. 1 fig, 14 ref.

Descriptors: *Flow measurement, *Discharge measurement, *Instrumentation, Streams, Velocity, Basic data collections, Hydrologic data, International hydrological decade.
Identifiers: Integrating float method.

A float released at the bottom of a stream may be used to determine the discharge of the stream. This method, the integrating float technique, gives discharges for any king of velocity profile. It is particularly suited for streamflow measurement at low velocities, but not limited to it. Other advantages include accuracy, simplicity, and the lack of need for calibrations. (See also W74-11493) (Knapp-USGS)
W74-11509

USE OF DEPTH FLOATS IN DRAINAGE CANALS WITH AQUATIC WEED,
Hydraulic Research Inst., Bratislava (Czechoslovakia).
J. Prochazka.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 197-205, 1973. 3 fig, 1 ref.

Descriptors: *Current meters, *Flow measurement, *Canals, Flow profiles, Discharge measurement, Water measurement, Velocity, Vegetation effects, International hydrological decade, Aquatic weeds.

Floats may be used to measure currents in irrigation canals. A theoretical analysis of the profile of water velocities in artificial irrigation canals is aimed at the whole cross-section as well as those parts which are accessible for using depth (bar) floats. They are usually the sections in the center of the trapezoidal profile and close to the water level due to the spread of weeds over the canal bed and banks during the growing period. Coefficients were developed for converting velocities recorded by means of floats to the mean profile velocity. A comparison of the results with measurements in the field is also presented. (See also W74-11493) (knapp-USGS)
W74-11510

MEASUREMENT OF DISCHARGE UNDER ICE COVER,
Water Survey of Canada, Winnipeg (Manitoba).
P. W. Strilaeff, and J. H. Wedel.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication, No 99, Vol I, p 214-227, 1973. 13 fig, 1 tab.

Descriptors: *Discharge measurement, *Ice cover, *Artic, Canada, Stream gages, Telemetry, Instrumentation, Data collections, Flow measurement, International hydrological decade.

A technique for estimation of river discharge using single velocity in a cross-section is proposed. Discharges derived using this technique and measured discharges using standard methods compare well. Discharge under ice may be computed on the basis of single velocity. To utilize the potential of this method fully, it is necessary to develop an instrument to be anchored firmly on the streambed to transmit velocities and possibly water levels and to develop an instrument to be installed on the river bank to receive and record velocities and water levels. TECHNIQUES FOR MEASUREMENT OF DISCHARGE BY DYE DILUTION,
Geological Survey, Washington, D.C.
H. H. Barnes, Jr., and F. A. Kilpatrick.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 251-259, 1973. 5 fig, 1 tab.

Descriptors: *Discharge measurement, *Dye dispersion, *Fluorescent dye, Dye releases, Water measurement, Stream gages, Gaging stations, Flow measurement, Instrumentation, Equipment, International hydrological decade.

Discharge measurements by dye-dilution were tested by the U.S. Geological survey for a wide variety of conditions to ascertain the suitability of the method for flow conditions where the current meter is not entirely adequate. The development of a reliable pneumatically-powered constant-rate injection apparatus and of stable fluorescent dyes measurable by fluorometers at concentrations of less than 0.1 microgram per liter enhances the constant-injection method of dilution gaging. This method is used extensively in gaging turbulent mountain streams, flow beneath ice, flow in shifting sand-channel streams, and in canals and manmade structures. (See also W74-11493) (Knapp-USGS)
W74-11513

STREAM HYDROGRAPHS BY FLUORESCENT TRACERS,
British Columbia Univ., Vancouver.
B. C. Goodell, and H. Steppuhn.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 260-270, 1973. 4 fig, 1 tab, 7 ref.

Descriptors: *Discharge measurement, *Dye dispersion, *Fluorescent dye, *Hydrographs, Water measurement, Stream gages, Gaging stations, Flow measurement, Instrumentation, Equipment, Dye releases, International hydrological decade.

A continuous stream-gaging system uses fluorescent tracers to produce stream hydrographs without the supplementary recording of stage. A tracer solution of known concentration is constantly injected at a known rate into the stream. Downstream, where the tracer is well mixed, sample flows are diverted through an automatic instrument which registers tracer concentrations on a gelatin-coated film. The exposed film is periodically gathered from stream sites, stored if necessary, and analysed in a laboratory-based fluorometer. Hydrographs resulting from 640 hours of gaging of two Colorado mountain streams with the system were compared with those obtained from closely located sharp-crested weirs. The maximum instataneous deviation between hydrographs reaches 10 percent and the average absolute departure equals 1.8 percent while algebraic departure averages +0.3 percent. W74-11514

CHEMICAL METHOD OF WATER FLOW MEASUREMENT IN OPEN CHANNELS,
State Inst. for Hydrology and Meteorology, Warsaw (Poland).
T. Czarnocki.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 271-278, 1973. 7 fig.

Descriptors: *Discharge measurement, *Tracers, *Colorimetry, Dye releases, Water measurement, Flow measurement, Stream gages, Open channel flow, International hydrological decade.
Identifiers: Chromates.

A chemical method for making discharge measurements is characterized by the fact that, with regular dosing of a tracer ($Na_2Cr_2O_7 \cdot 2H_2O$) the magnitude of constant concentration and the whole wave surface of the tracer are measured. In this way, two largely independent results are obtained. In practice, a group of three experienced workers can perform two measurements of discharge in an 8-hour day, including travel time by car up to 100 km. (See also W74-11493) (Knapp-USGS)
W74-11515

STREAM GAUGING WITH PORTABLE EQUIPMENT,
Research Council of Alberta, Edmonton.
R. Kellerhals, and M. Church.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 279-288, 1973. 8 fig, 8 ref.

Descriptors: *Stream gages, *Gaging stations, *Discharge measurement, Flow measurement, Instrumentation, Equipment, Data collections, Hydrologic data, Basic data collections, Dye releases, Dye dispersion, International hydrological decade.

Methods are described for the collection of short-period discharge records from steep streams with flows up to 100 cu m per sec. Excavation of a deep stilling well can often be avoided by locating the well some distance downstream from the measuring section. Connecting the well and stream through an inverted syphon also avoids trenching. The water level in wells with long, thin connections to the stream is linearly damped and can be converted to true stream level. Accurate discharges can be obtained by slug-injecting fluorescent tracers from volumetric pipettes or from prepared vials directly into the stream. At a downstream location where lateral mixing is assured, 10-20 samples should be collected during the passage of the tracer in order to determine the time-concentration curve, from which discharge can be computed. This method is particularly suitable for spot measurements during floods. (See also W74-11493) (Knapp-USGS)
W74-11516

PRECISION AND BIAS OF THE RESULTS OF DILUTION GAUGINGS,
Water Research Association, Marlow (England).
A. L. Wilson.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 289-299, 1973. 1 fig, 1 tab, 2 ref.

Descriptors: *Tracers, *Flow measurement, *Stream gages, *Solutes, Dispersion, Mixing, Water measurement, Data collections, Sampling, International hydrological decade.
Identifiers: Dilution gaging.

The effects of a number of sources of error on the precision and bias of results from dilution gagings are examined theoretically for the constant-rate-injection technique. From these considerations, recommendations are made for the precautions that should be observed to minimize the errors of the estimated discharges. Sites should be chosen so that complete mixing is obtained, and so that negligible losses or gains of the gaging ion occur. At least five samples of the stream should be taken from each of two sites over several hours in pairs corresponding to the same 'plug' of stream water. (See also W74-11493) (Knapp-USGS)
W74-11517

ADVERSE-BOTTOM-SLOPE WEIR AND ORIFICE,
Egyptian Desert Inst., Cairo.
M. I. Abaza.

In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 303-309, 1973. 4 fig, 5 ref.

Descriptors: *Weirs, *Discharge coefficient, *Stage-discharge relations, Flow measurement, Discharge measurement, Stream gages, International hydrological decade.
Identifiers: Adverse-bottom-slope weirs.

The boundary conditions of an adverse-bottom-slope weir and orifice differ from the standard conditions. The coefficients of discharge and their variations due to change in the adverse slope are discussed. In all cases of adverse-bottom-slope weir or orifice investigation, the discharge for the same head was higher than in the case of horizontal-slope weirs. The difference increases with increase of the slope and attains its maximum value at a slope around 2.5:1 for a weir and 4:1 for an orifice. The increase in the discharge coefficient obtained was 16% and 9% for adverse-bottom-slope weirs and orifices respectively. These results suggest the use of adverse-bottom-slope weir and gates instead of horizontal-bottom standard ones as they have a higher coefficient of discharge for the same head. (See also W74-11493) (Knapp-USGS)
W74-11518

LABORATORY CALIBRATION OF THE WALNUT GULCH SUPERCRITICAL FLOW-MEASURING FLUME,
Agricultural Research Service, Stillwater, Okla.
W. R. Gwinn.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 310-318, 1973. 11 fig, 1 tab.

Descriptors: *Flumes, *Flow measurement, *Stream gages, *Calibrations, Discharge measurement, Supercritical flow, Sediment load, Water measurement, Stage discharge relations, International hydrological decade.
Identifiers: *Supercritical flumes.

A new supercritical measuring flume is used to gage sediment-laden ephemeral flows in steep channels. The transition from the natural channel to the straight modified trapezoidal measuring section of the flume consists of a cylindroid surface. The flume is kept free of deposition by a V-shaped floor which slopes in the direction of flow. The head is measured at the midpoint of the straight section. Ten of these concrete flumes have been installed in the Walnut Gulch Watershed near Tombstone, Arizona. The largest has a bottom width of 36.6 meters and a capacity of about 740 cu m per sec. This structure is the largest known precalibrated flume now in operation. The design of the flumes, the laboratory calibration data and some observations of the field operation are discussed. (See also W74-11493) (Knapp-USGS)
W74-11519

FREE SURFACE SUBCRITICAL FLOW MEASUREMENT,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
G. V. Skogerboe, and L. H. Austin.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 319-327, 1973. 4 fig, 9 ref. OWRT B-018-UTAH(5).

Descriptors: *Stage-discharge relations, *Stream gages, *Subcritical flow, *Pipe flow, *Urban hydrology, Storm runoff, Flow measurement, Water measurement, Discharge measurement, Flow around objects, International hydrological decade.

Analysis of submerged (subcritical) flow measurement at open channel constrictions can be applied to numerous types of side and overflow constrictions. A good example would be bridge constrictions with the so-called 'Abnormal Stage Condition', for which very little data are available. The techniques should be applied to the urban hydrology research program regarding free surface flow measurement at closed conduit constrictions. Stage-discharge ratings for open channel sections can be analyzed mathematically and experimentally for the effects of channel geometry and boundary resistance. Changes in the rating curve with time at a particular station could be related to changes in hydraulic characteristics of the channel. Also, the use of such techniques would provide a means of testing the accuracy of historical runoff records. (See also W74-11493) (Knapp-USGS)

GAUGING STATIONS ON SEDIMENT-LOADED MOUNTAIN RIVERS,
Swiss Federal Water Resources Bureau, Bern.
E. Walser.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 336-344, 1973. 5 fig.

Descriptors: *Stream gages, *Gaging stations, *Bed load, *Scour, *Supercritical flow, Stage-discharge relations, Flow measurement, Discharge measurement, Weirs, Flumes, International hydrological decade.
Identifiers: *Switzerland.

In a gaging station designed for streams with very large bed loads, the slope of the channel is such that the water flows with supercritical velocity. Sediment is not deposited at such velocities. For a given discharge, the water enters the channel at the same velocity as that at which it leaves the channel. Upstream of the upper end of the channel there is a weir so arranged that a scour hole is produced between this weir and the entrance of the channel. The entrance into the channel is not influenced by the changing approach velocities to the weir; it is only conditioned by the height of the water surface in the scour hole. This height depends on the discharge entering the channel, which, under steady conditions, is equal to the discharge arriving from upstream. The water leaves the channel forming a free nappe. Twelve stations in the Swiss network have been constructed on the basis of these ideas. They are working well. (See also W74-11493) (Knapp-USGS)
W74-11522

FLOW MEASUREMENT OF LOW-GRADIENT STREAMS IN SANDY SOILS,
Agricultural Research Service, Athens, Ga. Southeast Watershed Research Center.
P. Yates, and J. M. Sheridan.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 345-352, 1973. 1 fig, 5 ref.

Descriptors: *Stream gages, *Gaging stations, *Bed load, *Scour, *Supercritical flow, Stage-discharge relations, Flow measurement, Discharge measurement, Weirs, Flumes, *Georgia, International hydrological decade.
Identifiers: *Little River Experimental Watershed(Ga).

Design, construction, and maintenance details are described for submerged broad-crested V-notch weirs used for flow measurements in Little River Experimental Watershed near Tifton, Georgia. Weir rating techniques, including model studies and volumetric, pitot tube, and current meter methods for the prototypes, are presented. Methods are given for simultaneously recording upstream and downstream stages with digital-type recorders and subsequent development of rating equations for computing flow data which are used in watershed hydrologic analyses. Few satisfactory natural controls are found in the low-gradient streams of the Southern Coastal Plain, United States, and accurate discharge data are scarce. Artificial control difficulties involve backwater effects and lack of free overfall, dictating a compromise between weir submergence and ponding. Structure stability and scour protection cause special difficulties in the noncohesive soils of the region. (See also W74-11493) (Knapp-USGS)
W74-11523

MEASUREMENT AND ESTIMATION OF FLOOD DISCHARGES,
Geological Survey, Washington, D.C.
M. A. Benson.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 355-360, 1973. 1 tab, 12 ref.

Descriptors: *Stream gages, *Flow measurement, *Discharge measurement, *Floods, *Stage-discharge relations, Water levels, Basic data collections, Flow profiles, Rivers, Water measurement, International hydrological decade.

Flood discharge measurements may be made under extreme conditions by the use of specialized equipment or techniques. Measurement of large flows is exemplified by measurement of the Amazon, Mississippi, and Columbia Rivers. Large sounding weights are used; power equipment is used for sounding from boats, trucks, trailers, or powered cable cars. Special means may be used for stationing along a cross-section, as in the Amazon measurements. The optical velocity meter is a device which uses the stroboscopic effect for measuring the surface velocity of a stream. This method, in conjunction with an acoustic depth sounder, was used successfully to measure flows during recent extreme floods in California. Indirect measurements are a recourse on all sizes of streams when floods cannot be measured as they occur. Discharge is computed by post-peak measurements, through a reach of river (the slope-area method), through a bridge (the contracted-opening method), over dams, and through culverts. (See also W74-11493) (Knapp-USGS)
W74-11524

THE AIR-BUBBLE METHOD OF FLOW MEASUREMENT AND ITS APPLICATION,
National Water Authority, Budapest (Hungary).
L. J. David.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 361-373, 1973. 9 fig.

Descriptors: *Flow measurement, *Stream gages, *Bubbles, Instrumentation, Calibrations, Water measurement, Flow characteristics, Open channel flow, International hydrological decade.

The air-bubble method of flow measurement was designed for use in open channels. The rate of flow is obtained as the product of the area of the flow diagram and the terminal rising velocity of the bubbles, which can be considered constant under certain conditions. Laboratory and field measurements show that the terminal rising velocity of the cluster of bubbles is constant if the specified conditions of air injection are observed, and if it is greater in flowing than in standing water. The flow

diagram is recorded and determined by a photographic method. The mean error of measurement is estimated at 4 to 5 percent. (See also W74-11493) (Knapp-USGS)
W74-11525

DISCHARGE MEASUREMENT IN OPEN WATER BY MEANS OF MAGNETIC INDUCTION,
Hanover State Ministry for Food, Agriculture and Forests (West Germany).
H. Gils.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication, No 99, Vol I, p 374-381, 1973. 4 fig, 11 ref.

Descriptors: *Discharge measurement, *Hydrographs, Monitoring, Instrumentation, Flow measurement, Magnetic studies, Current meters, International hydrological decade.
Identifiers: *Magnetic induction.

A monitoring installation automatically measures open water discharge by magnetic induction and produces a discharge hydrograph. It is entirely without components impeding flow and the discharge cross-section is not constricted. The installation operates on a.c., 60 Hz. Soienoids produce a homogeneous magnetic field. In the water flowing through the magnetic field, a voltage is induced which is picked up by two electrodes. The installation measures water depth and mean velocity. Multiplied by the width of the water, these values give the discharge, which is instantaneously indicated and recorded in the form of a hydrograph through impulses once every 15 min. The measured values can be stored and automatically averaged to give mean daily and mean monthly discharges. (See also W74-11493) (Knapp-USGS)
W74-11526

ACCURACY AND RATIONALIZATION OF RIVER DISCHARGE MEASUREMENTS,
Godudarstvennyi Gidrologicheskii Institut, Lengingrad (USSR).
I. F. Karasev, and A. N. Chizhov.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 382-387, 1973. 1 tab.

Descriptors: *Discharge measurement, *Calibrations, *Current meters, Stream gages, Depth, Velocity, Flow measurement, Hydrologic data, Data collections, International hydrological decade.
Identifiers: USSR.

In measuring discharge by current meter, the errors of the method, both random and systematic, are of primary importance; the errors of depth and velocity measurements should be considered first of all. The error in velocity is due to turbulent pulsation of velocity and depends only slightly on the instrumental error. Areal averaging of depth and velocity from a series of verticals decreases the error of discharge measurements. It allows a small increase of error in velocity measurement without great increase in the error of discharge. It also permits reduction of the duration of current meter exposure at a given point, which in turn accelerates the discharge measurements. This averaging in space and time is most useful for the integration methods of discharge measurements, particularly for integration of velocities down the vertical. (See also W74-11493) (Knapp-USGS)
W74-11527

ULTRASONIC MEASUREMENT OF DISCHARGE IN RIVERS,
Public Works Research Inst., Tokoyo (Japan).
T. Kinosita.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 388-399, 1973. 9 fig.

Descriptors: *Flowmeters, *Radar, *Stream gages, Discharge measurement, Flow measurement, Water measurement, Instrumentation, Data collections, Hydrologic data, International hydrological decade.
Identifiers: *Japan.

Progress in improvement of ultrasonic flowmeters in Japan since 1964 is discussed. Data obtained by ultrasonic flowmeters are compared with those from rotating current meters; agreement is very good. The most significant merit of the ultrasonic flowmeter is that the lateral mean velocity can be obtained. (See also W74-11493) (Knapp-USGS)
W74-11528

MEASUREMENT OF DISCHARGE AS INFLOW INTO LEAKY RESERVOIRS,
Agricultural Research Service, Riesel, Tex.
W. G. Knisel, Jr.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 400-407, 1973. 6 fig, 4 ref.

Descriptors: *Water loss, *Reservoir leakage, *Flood control, *Karst hydrology, *Texas, Reservoirs, Water balance, Water measurement, Flow measurement, International hydrological decade.
Identifiers: *Edwards plateau(Tex).

Surface runoff is measured in leaky floodwater detention reservoirs in the Edwards Plateau near Sonora, Texas. The Edwards Plateau is a karst area in southwest Texas and the reservoirs are underlain by cavernous limestone. Losses from detention storage occur at variable rates throughout times of inflow and outflow. Estimates of loss rates are necessary to determine the total volumes of inflow. Reservoir stage loss rates can be determined from reservoir stage records when inflow is known to have ended. The loss rates can be applied throughout the stage record to estimate total inflow accurately. Loss rates estimated from the reservoir depletion record and used as an input into the computer with the time-stage record enables step-by-step computation to the time that inflow ends. Volume of losses determined from estimating equations agreed within 5% of the volume of losses computed by the conventional method of estimating loss rate in feet per hour from the stage record after inflow ended. (See also W74-11493) (Knapp-USGS)
W74-11529

A RECORDING METER FOR MEASURING THE OVERLAND FLOW,
Technische Universitaet, Dresden (East Germany). Dept. of Hydrology and Meteorology.
G. Peschke, and W. Krause.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 408-411, 1973. 2 fig.

Descriptors: *Overland flow, *Stream gages, *Instrumentation, Water measurement, Discharge measurement, Flow measurement, Data collections, Hydrologic data, International hydrological decade.

A system is described for determining the overland flow as a component of the streamflow in rivers. The apparatus enables continuous recordings of the overland flow intensity to be made within the range from 2 to 200 liters per hour. Water flowing off a runoff plot is collected in a trough and led to a recording meter. In the meter two measuring tanks are alternately filled by a tipping tray and emptied by a siphon. The water level changes in the tanks are recorded through floats by two pens on a drum. (See also W74-11493) (Knapp-USGS)

PROBLEMS OF FLOW MEASUREMENT IN LARGE RESERVOIRS,
Hydraulic Research Inst., Prague (Czechoslovakia).
J. Urban.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 423-431, 1973. 4 fig, 1 tab.

Descriptors: *Flow measurement, *Reservoirs, *Backwater, *Discharge measurement, Currents(Water), Streamflow, Flow profiles, Water levels, International hydrological decade.

The backwater effect of a high dam or of a series of dams can influence the flow in a very long reach of river. Direct measurement of the velocity of discharge in such streams is rather complicated; it can give good results only under simple conditions of flow through the reservoir. A simplified analysis of the longitudinal distribution of discharge in a reservoir is presented. If a tributary joins the main stream within the backwater reach, the rate of flow and the direction of flow in any cross-section depend on the inflow from the main stream and from the tributary, on the outflow from the reservoir and on the geometric and hydraulic characteristics of the reservoir. The analysis assumes that the temperature and density of water are homogeneous and that the changes in the inflow and outflow rates are slow enough to avoid formation of waves and secondary currents in the reservoir. (See also W74-11493) (Knapp-USGS)
W74-11532

LE (LEADING EDGE) FLOWMETER--A UNIQUE DEVICE FOR OPEN CHANNEL DISCHARGE MEASUREMENT,
H. Holmes, D. K. Whirlow, and L. G. Wright.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 432-443, 1973. 4 fig, 1 tab.

Descriptors: *Flowmeters, *Flow measurements, *Sonar, Discharge measurement, Water measurement, Gages, Stream gages, Equipment, Instrumentation, Calibrations, Current meters, International hydrological decade.

Leading edge (LE) acoustic flowmeters can measure open channel volumetric flow. Problems associated with the inhomogeneity of the medium were overcome, as evidenced by the successful operation of the LE flowmeter on various rivers and canals in the United States. Using the time differences resulting from transmitting signals between transducer pairs, average path velocities are calculated. Volume flow is computed by appropriately weighting the individual path velocities. Minimum resolvable flow, which is inversely proportional to path length, is about 0.2 m/sec for a 1 m path. For maximum accuracy, multiple paths are required. In channels with constant stage, flow is obtained by quadrature integration independent of the velocity profile. With variable stage, a water level sensor is also required. A typical flow with stage changes of plus 21% and minus 7% can be integrated to better than 1% accuracy. (See also W74-11493) (Knapp-USGS)
W74-11533

A CONSTANT DISCHARGE SIPHON FOR FLOW MEASUREMENT AND CONTROL,
Illinois Univ., Urbana. Dept. of Civil Engineering.
B. C. Yen, and V. T. Chow.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 444-452, 1973. 3 fig, 3 ref. NSF Grant GK-11292.

Descriptors: *Flow measurement, *Water measurement, *Flow control, *Siphons, Stream gages, Instrumentation, Data collections, Discharge measurement, Gages, International hydrological decade.

A simple, inexpensive device consisting of a floating siphon system can be used both to discharge water from a container at a constant rate independent of the stage in the container and, simultaneously, to measure the variable rate of flow discharged into the container, provided the downstream water stage is low enough for the siphon to discharge water freely into the atmosphere. The device consists of hollow polyethylene boxes as the float and bent polyethylene tubes embedded in the boxes as the siphons. The total constant discharge of the siphon system can be varied by controlling the number of the siphons in operation and the siphon head. The float is connected to a stage recorder to obtain a discharge record. (See also W74-11493) (Knapp-USGS)
W74-11534

THE DEVELOPMENT AND PERFORMANCE OF A NEW HIGH ACCURACY HYDROGRAPHIC TELLUROMETER MODEL MRB 201,
Tellurometer, Ltd., Chessington (England).
J. d'Arcy.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 455-465, 1973. 2 fig, 1 tab, 2 append.

Descriptors: *Surveying instruments, *Hydrography, *Instrumentation, Measurement, Oceanography, Data collections, International hydrological decade.
Identifiers: *Tellurometers.

A new high accuracy (plus or minus 1 m) hydrographic Tellurometer is described. The techniques and special features of the equipment are discussed and the results of field trials conducted with the prototype are included. The instrument is designed to work up to a maximum rate of 30 knots. To enable the operator to take down readings manually at maximum speed, a button has been provided which holds the reading on the readout for as long as it is desired. (See also W74-11493) (Knapp-USGS)

MODERN POSITION FIXING METHODS,
Federal Board for Navigation, Coblenz (West Germany).
W. Lohrberg.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p466-476, 1973. 7 fig.

Descriptors: *Surveying instruments, *Hydrography, *Instrumentation, Measurement, Oceanography, Data collections, International hydrological decade.

Modern electronic position fixing methods are described and the prerequisite conditions for automatic recording and evaluation are shown. A precise knowledge of the morphology of the sea bottom or river beds is required. It is necessary both to increase the number of soundings and the precision of their positions and to evaluate the survey results faster. The aim must be to record survey data by electronic computers and plotters. Close co-operation between users and manufacturers has resulted in the development of recording and evaluation systems so that this ideal is now a reality. (See also W74-11493) (Knapp-USGS)
W74-11536

THE APPLICATION OF AN ORIENTATION SYSTEM FOR CONTINUOUS OBSERVATIONS FOR THE COMPILATION OF RIVER CHANNEL MAPS BY MEANS OF AN ECHO SOUNDER,
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
N. S. Zubkov.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 477-480, 1973. 3 fig.

Descriptors: *Surveying instruments, *Hydrography, *Instrumentation, Measurement, Oceanography, *Data collections, International hydrological decade, Maps, Mapping.

A method is presented for the determination of the horizontal position of sounding points by the use of two angles of resection. The angles are estimated by the continuous observation of permanent shoremarks by means of three layout devices installed on the deck of the sounding vessel. Angles of resection are obtained by using a system comprising self-synchronizing sensors and differential self-synchronizers. The horizontal position of sounding points is fixed on the map on board the moving ship. The depths measured by the echo-sounder are recorded simultaneously. The time-lap between field and office work is eliminated. (See also W74-11493) (Knapp-USGS)
W74-11537

DIGITAL MEASUREMENTS OF RIVER BED PROFILES USING A GENERAL-PURPOSE DATA ACQUISITION SYSTEM,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
J. R. Glover, and D. D. Moran.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 483-490, 1973. 5 fig, 1 ref.

Descriptors: *Surveying instruments, *Hydrography, *Sounding, Instrumentation, Measurement, Oceanography, Data collections, International hydrological decade.

A computerized data acquisition system for measuring bed profiles is described. The system incorporates an IBM 1801 digital computer and Bludworth sounder which use a magnetic tape recorder and other components to provide punched cards with numbers representing the depth for each sounding. Interface hardware and programming techniques establish synchronization between the computer and sounder. (See also W74-11493) (Knapp-USGS)
W74-11538

THE MEASUREMENT OF MEAN TEMPERATURE ON A REACTION VELOCITY BASIS AND ITS APPLICATION TO HYDROLOGY,
Baden Wuerttemberg Hydrological Service, Karlsruhe (West Germany).
W. Schmitz.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 506-515, 1973. 4 fig, 6 ref.

Descriptors: *Water temperature, *Measurement, *Thermometers, *Hydrolysis, Monitoring, Instrumentation, Water quality, Water measurement, Thermal pollution, Data collections, International hydrological decade.
Identifiers: Germany, Polarimetry.

The dependence of the reaction velocity of sucrose hydrolysis on temperature may be used to estimate the temperature of the surroundings. The changes in concentrations of sucrose during the exposures, measured in a polarimeter, are the basis for calculations of average temperatures. The method is very reliable, so that it may be applied to many programs of measuring water temperatures, especially as influenced by cooling water discharges of power stations. The method is described, including details of the computer programs for data calculations. The results of temperature studies in the River Neckar, Germany are discussed. (See also W74-11493) (Knapp-USGS)
W74-11539

EXPERIENCES WITH PHOTOMETRIC TURBIDITY MEASUREMENTS,
Bayerischer Gewaesserkundedienst Staatlich, Munich, (West Germany).
J. Burz.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 519-530, 1973. 7 fig, 2 tab, 12 ref.

Descriptors: *Turbidity, *Suspended load, *Photometry, Measurement, Instrumentation, Light penetration, Optical properties, Water quality, Monitoring, Calibrations, Data collections, International hydrological decade.

Sediment measurements were carried out in Bavarian rivers using two turbidimeters (Sigrist photometer and Askania turbidimeter). In the course of these tests special emphasis was placed on reliability in operation, maintenance, expenditures, and calibration. Almost each sample of suspended sediment, as well as each particle size range of the same sample, results in a different calibration curve. Thus the calibration is ambiguous, especially since the granularity and composition of suspended sediments may vary within the same water. Light transmitting capacity and light scatter depend not only on the concentration of the suspended material, but also on the size, color, reflection and absorption capacity of the particles. In colored water, the coloration causes considerable errors in absorption measurements. Turbidity and coloration have the same effect and thus confound any conclusion related to the individual components. (See also W74-11493) (Knapp-USGS)
W74-11540

A METHOD FOR MEASURING THE QUALITY OF BEDLOAD TRANSPORTED BY SHORT FLOOD WAVES,
Bulgarian Academy of Sciences, Sofia. Inst. of Water Problems.
B. V. Georgiev, and R. D. Papazov.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 531-537, 1973. 4 fig, 1 tab.

Descriptors: *Sampling, *Bed load, Sedimentation, Sedimentology, Sediment load, Sediment transport, Flood waves, Floods, Peak discharge, Data collections, International hydrological decade.
Identifiers: *Sediment traps.

Sediment traps installed in the river bed are used for the strip method of measuring bedload during floods. The size and form of the sediment traps were determined by experiments in the laboratory and in the field. The traps are designed to retain all material caught in them. The method provides the mean bedload discharge, its distribution in the cross-section, and the total mass of bedload transported by the flood wave. Conventional sampling measurement of bedload during the passage of floodwaves, when the most rapid movement of

bedload is taking place, is not always possible because of the high velocities experienced. (See also W74-11493) (Knapp-USGS)
W74-11541

BEDLOAD MEASUREMENT BY MEANS OF BOTTOM PLATES AND BEDLOAD SAMPLERS WITH HYDROPHONE ATTACHMENTS,
Bundesanstalt fuer Gewasserkunde, Coblenz (West Germany).
H. Hinrich.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 544-551, 1973. 4 fig.

Descriptors: *Bed load, *Sampling, *Measurement, *Acoustics, Sediment transport, Sedimentation, Sedimentology, Instrumentation, Data collections, International hydrological decade.

A sampler was developed recently to simultaneously measure the quantity of bedload transport and observe it acoustically. For this purpose, a bedload sampler was fitted with an underwater microphone, the sound transmitter of which is connected, via an amplifier, to a headset and a loudspeaker. The measurements can show the irregularities in bedload transport caused during the passing of a ship, in particular during the so-called critical runoff phase. (See also W74-11493) (Knapp-USGS)

INSTRUMENTATION CONSIDERATIONS FOR STUDIES OF QUALITY OF RUNOFF FROM SMALL AGRICULTURAL WATERSHEDS,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
W. M. Edwards, and L. L. Harrold.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 575-581, 1973. 3 fig, 9 ref.

Descriptors: *Water quality, *Instrumentation, *Monitoring, *Sampling, *Small watersheds, Data collections, Telemetry, Water analysis, Water pollution sources, Farm wastes, Fertilizers, International hydrological decade.

Evaluating water quality on small agricultural basins is directed toward relating pollution to manageable or predictable factors. Continuous monitoring and telemetering is limited to a few parameters and to continuously flowing streams. Discrete samples must be collected when surface runoff from individually treated fields and intermittent flowing watersheds is to be studied. The sampling program must be determined by the specific goals of research. Sample size, frequency, storage, preparation for analysis, analysis, and interpretation must be carefully planned to ensure interpretable results. Devices that automatically take several samples, refrigerate them, and indicate on a hydrograph the exact time and flow rate are described. Merits of various flow sensors, intakes, distribution systems, containers, and event recorders are discussed. (See also W74-11493) (Knapp-USGS)

MEASUREMENT AND SIGNIFICANCE OF ELECTRICAL CONDUCTIVITY IN SMALL MOUNTAIN STREAMS,
Swiss Forest Research Inst., Birmensdorf.
H. M. Keller.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 588-595, 1973. 3 fig, 2 tab, 9 ref.

Descriptors: *Water quality, *Discharge(Water), *Electrical conductance, Runoff, Conductivity, Streamflow, Forests, Alpine, Sampling, Data collections, Water chemistry, International hydrological decade.
Identifiers: *Switzerland.

Five small catchments in the Prealps of Switzerland were investigated over two years (1967-68) to establish relationships between discharge and water quality characteristics. Forests cover between 38 and 92 percent, and swampy areas between 4 and 40 percent. Their exposure varies between E and WNW. The electrical conductivity at 20 deg C, as measured with a plastic conductivity cell shows marked negative correlation with discharge rates as determined with the salt dilution method. Assuming similar annual flow regime, the regression of electrical conductivity on discharge may be used to estimate average surface runoff conditions in these catchments. SPECIAL HYDROMETRIC SHIPS FOR THE INLAND WATERWAYS OF THE FEDERAL REPUBLIC OF GERMANY,
Bundesanstalt fuer Gewasserkunde, Coblenz (West Germany).
H. Jansen, and J. Sindern.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 639-647, 1973. 2 fig.

Descriptors: *Ships, *Water measurement, *Discharge measurement, Hydrometry, Bed load, Sampling, Current meters, Sounding, Discharge(Water), Flow measurement, Suspended load, Instrumentation, Sediment load, International hydrological decade.
Identifiers: *Germany.

Ships are used for hydrometric work on the inland waterways of the Federal Republic of Germany, in particular for the measurement of current speed, discharge, and bedload and suspended sediment transport. Water depth below the ship or above an area is sounded and graphically recorded with the aid of echo sounders, radiologs, depth recorders and bank distance sounders (horizontal sounders). Cross-sections are either reproduced immediately to scale, or recorded on punched tape for evaluation by computer and printing to a desired scale by plotter. (See also W74-11493) (Knapp-USGS)
W74-11551

TEMPERATURE MEASUREMENTS OF WATER SURFACES USING INFRA-RED RADIATION THERMOMETERS,
Deutscher Wetterdienst, Hohenpeissenberg (West Germany).
D. Lorenz.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 651-667, 1973. 13 fig, 3 tab, 18 ref.

Descriptors: *Remote sensing, *Infrared radiation, *Water temperature, Aircraft, Data collections, Instrumentation, Solar radiation, Thermometers, International hydrological decade.
Identifiers: *Radiometers.

In infrared radiation thermometers used in meteorology and hydrology, a narrow bandpass, from 9.5 to 11.5 micrometers is convenient for the temperature measurements of water surfaces. A radiometer with this narrow bandpass was tested in an aircraft flying over water. Airborne measurements of a reservoir were made along the 8 flight paths within a quater of an hour. The PRT 6 was used with filter A (9.5 to 11.5 micrometers). The flight level was 90 m above the water surface so that the target area was about 5m x 5m. The results showed which parts of the reservoir were ice covered. Furthermore, it was possible to plot the isotherms of the water surface temperature. The highest temperatures along the longitudinal axis of the lake are close to the former riverbed. Because of the heavy turbulence of the water near the inlet of the electric plant, the surface temperature was almost the same as in the river. (See also W74-11493) (Knapp-USGS)

EARTH SATELLITES AND THEIR APPLICATIONS IN HYDROMETRY AND HYDROLOGY,
National Environmental Satellite Center, Suitland, Md.
E. P. McClain, and D. R. Baker.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 668-677, 1973. 3 fig, 7 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Telemetry, Data collections, Hydrologic data, Infrared radiation, Instrumentation, Surveys, Hydrology, Hydrometry, International hydrological decade.

Earth satellites can be used for operations or research in hydrometry and hydrology as a platform for remote sensors and as a data relay device. The types of orbits generally the most useful are sun-synchronous, which are relatively low altitude and near-polar inclination; and earth-synchronous, which are relatively high and near-equatorial. The types of remote sensing equipment that are available or under development range across the electromagnetic spectrum from microwave through infrared and visible frequencies. There have already been limited applications of visible and infrared data from meteorological satellites to hydrologic and related problems. Equipment is being developed that will enable analog or digital output from hydrometric or hydrologic observation systems at the ground to be relayed via satellite to central data processing centers. W74-11553

MEASURING DEVICES IN STATIONARY AND MOBILE CONTROL STATIONS FOR THE SUPERVISION OF RIVERS, SHOWN BY THE EXAMPLE OF THE LIPPE AND EMSCHER RIVERS,
Emschergenossenschaft, Essen (West Germany).
E. Knop.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 705-716, 1973. 15 fig.

Descriptors: *Monitoring, *Water pollution control, *Water quality, Rivers, Dissolved oxygen, Water temperature, Conductivity, Turbidity, Sediment load, International hydrological decade.
Identifiers: *Germany(Lippe River), *Germany(Emscher River).

A network of coordinated data and control stations on the Lippe and Emscher Rivers of Germany is discussed and modern instrumentation for stationary and mobile control stations which has proved efficient in the past is reviewed. At control stations, the essential properties of the water are continuously recorded. The control stations are also equipped with fish tanks through which river water, waste water, or a known mixture of waste water with dechlorinated mains water or river water constantly flows. The main advantage of this very simple fish test is that it covers the superimposition of toxic effects which cannot always be determined from the specific, continuously measured or laboratory concentrations of the various load components. If the fish show adverse effects, stored samples are available to discover the reasons for damage. Automatic measuring devices determine specific properties and load factors of the water. Oxygen content, water temperature, air temperature, conductivity, pH, turbidity, and structure of solid matter are monitored. (See also W74-11493) (Knapp-USGS)
W74-11554

HYDRA II--AUTOMATIC DIGITAL TELEMETERING SYSTEM,
Research Inst. for Water Resources Development, Budapest (Hungary).
T. Puskas, and H. Karsai.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 717-721, 1973. 1 fig.

Descriptors: *Telemetry, *Water measurement, *Monitoring, Instrumentation, Precipitation gages, Water levels, Gaging stations, Data collections, Data transmission, Data processing, Hydrologic data, International hydrological decade.
Identifiers: *Hungary.

A telemetering system used in Hungary was designed to transmit, collected, record and evaluate hydrological information and to issue signals or orders. Its working radius is about 50 km. At present it is capable of collecting precipitation and water level information. The information is recorded in decimal units on a paper tape. A signal is produced when a critical instantaneous value is attained or exceeded or a change in value occurs. It can be operated either automatically or manually when required. Thirty-two stations can be connected to a center, and at the same time three digital and six analog sensors can be connected to a station. (See also W74-11493) (Knapp-USGS)
W74-11555

WATER-QUALITY MONITORING AND DATA TRANSMISSION,
Geological Survey, Washington, D.C.
G. F. Smoot.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 722-729, 1973. 2 fig, 3 ref.

Descriptors: *Monitoring, *Water quality, *Data transmission, Instrumentation, Equipment, Training, Hydrologic data, Data collections, Sampling, International hydrological decade.

The evolution of automatic water-quality monitoring within the Water Resources Division of the U.S. Geological Survey is briefly reviewed, and the automated water-quality monitoring system now in use by the Geological Survey is described. The description includes all principal components from the sampling technique to the computer-processed data compilation. A description of the digital telemetry system most frequently used by the Geological Survey is also included. The experience gained from operating a nationwide network for a number of years and the procedures and techniques pertaining to training of field personnel, construction of onsite facilities, calibration of sensors, establishing maintenance schedules, and processing of data are discussed. (See also W74-11493) (Knapp-USGS)

RADIO CONTROL OF WATER LEVEL GAUGES IN WATERCOURSES ENDANGERED BY HIGH WATER LEVELS,
Emschergenossenschaft, Essen (West Germany).
V. Stalmann.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 730-736, 1973. 4 fig.

Descriptors: *Telemetry, *Water levels, *Floods, *Warning systems, Stage-discharge relations, Gaging stations, Stream gages, Data transmission, Hydrologic data, Flow measurement, International hydrological decade.
Identifiers: *Germany(Emscher River), *Germany(Lippe River).

Telemetry of stage data is used in regulated watercourses operated for decades by Emschergonossenschaft and Lippeverband in Germany. High water levels can develop within a very short amount of time and with only a very little time lag after rainfall, especially in small catchments covering areas of only a few square kilometers. In order to avert damage and danger, it is indispensable to have information as early as possible on the different water levels at important points. Numerous flow measuring posts established by the two associations are susceptible to defects and disturbances, are slow in operation, and are rather expensive to operate and maintain. Therefore, Emschergenossenschaft and Lippeverband developed, in cooperation with AEG Telefunken, a system for the radio transmission of water levels to a central control station. Tests show that this teletransmission system has good recording accuracy. The costs of such a system are lower than those for telephone transmission of water levels. Several of the new radio transmission flow measuring posts started operation in 1970. (See also W74-11493) (Knapp-USGS)
W74-11557

A COMPUTER AUTOMATED SYSTEM FOR HYDROLOGIC DATA ACQUISITION AND ANALYSES,
Arizona Univ., Tucson. Dept. of Watershed Management.
J. L. Thames, and R. M. Tinlin.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 737-746, 1973. 3 fig, 1 tab.

Descriptors: *Telemetry, *Automation, *Data transmission, *Data processing, *Arizona, Training, Monitoring, Data collections, Hydrologic data, Water measurement, Digital computers, Forests, Deserts, International hydrological decade.

An interfaced hydrologic data acquisition and processing system was installed at the University of Arizona. A forested mountain watershed and a desert watershed area within a 50 km radius of the campus were instrumented for measuring a variety of hydrologic and climatic variables. Measurement data are both multiplexed over the telephone system and transmitted by radio. Measurements on the desert watershed may be programmed in any sequence and sampling rate varied from seconds to 24-hr intervals automatically or according to the rate at which input signals may change. Operation of the system is automated from a central laboratory by a small computer. Reference information, preliminary data reduction programs, and control data may be entered into the system. All output is recorded on magnetic tape, but may also be displayed on strip charts or teleprinter. The facility provides input-output data for research in synthesizing the hydrologic behavior of watersheds. It also offers a unique means of teaching principles of hydrologic processes, methods of data acquisition, and procedures in hydrologic analyses. (See also W74-11493) (Knapp-USGS)
W74-11558

RECORDING AND TELETRANSMISSION OF MEASURED DATA IN HYDROLOGY AND RELEVANT WMO ACTIVITIES,
E. Walser.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 753-757, 1973.

Descriptors: *Telemetry, *Data collections, *Hydrologic data, Automation, Meteorological data, Data transmission, Data processing, Instrumentation, Water measurement, International hydrological decade.

Instruments and methods of observation used by the World Meteorological Organization Commission for Hydrometeorology are reviewed. Automatic equipment is used for observing and transmitting hydrometeorological elements. The scope of this work, including the description and evaluation of automatic sensors, teletransmitting and automatic processing equipment, is described. While particular emphasis is placed on elements connected with hydrometry, other hydrological elements are also considered. Concise general information on WMO activities in the whole field of automatic collection, teletransmission and processing of data is given. (See also W74-11493) (Knapp-USGS)

ERRORS IN MEASUREMENT OF FLOW BY VELOCITY AREA METHODS,
Waterloopkundig Laboratoriu, Delft (Netherlands).
H. Botma, and A. J. Struyk.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 771-784, 1973. 6 fig, 5 tab, 2 ref.

Descriptors: *Flow measurement, *Current meters, *Data collections, *Statistics, Flowmeters, Stream gages, Water measurement, Hydrologic data, International hydrological decade.
Identifiers: Error analysis.

Routine measurements of flow in open channels, carried out using current meters and applying the velocity area method, do not give sufficient information to estimate the accuracy of the method. In order to determine the magnitude of the errors much more detailed measurements are needed. Errors are caused by using a finite time to measure the local point velocities, using a finite number of points per vertical, and using a finite number of verticals. The mean error is always negative. Various methods of choosing verticals do not give very

different results. But using only a very few verticals, the more information used in choosing the verticals, the better the result. The number of verticals appears to have the most influence on total error, which is not surprising if the form of the cross-section is taken into account. (See also W74-11493) (Knapp-USGS)

THE CRITERION OF INFORMATION SUFFICIENCY WITH AUTOMATION OF HYDROLOGICAL MEASUREMENTS,
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
A. M. Dimaksian.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 785-792, 1973. 3 fig, 1 tab, 3 ref.

Descriptors: *Water measurement, *Statistics, *Network design, *Data collections, *Hydrologic data, Gaging, Gaging stations, International hydrological decade.
Identifiers: USSR.

Hydrological investigations involve study of a continuous process using a series of discrete values. The amount of information required to represent the process to a required accuracy must be determined. A method to calculate the optimum number of measurements for a given accuracy is presented. Error distribution curves show that the accuracy and the frequency of measurements are related by an exponential function. On the basis of these curves, the efficiency of hydrometric measurements may be determined, and a superfluous complexity of automatic measuring devices may be avoided. UTILIZATION OF REMOTELY-SENSED DATA IN THE MANAGEMENT OF INLAND WETLANDS,
Geological Survey, Washington, D.C.
V. Carter, and D. G. Smith.
Available from the National Technical Information Service, Springfield, Va 22161, as N73-33314, Price $3.00 printed copy; $2.25 microfiche. Contract Report for NASA, 1973. 14 p, 9 fig, 10 ref. NASA Contracts NAS 5-21752 and NAS272.

Descriptors: *Remote sensing, *Water management(Applied), *Land management, *Wetlands, Water levels, Hydrologic data, Data collections, Water balance, Mapping, Florida, Virginia.

Remote sensing provides a powerful tool to meet critical management needs for inventory and classification of inland wetlands as well as for evaluation of the wetland role in the hydrologic cycle, identification of significant wetlands for wildlife preservation, and monitoring of wetland change. Remotely-sensed data are being utilized for wetland management in the Dismal Swamp (Virginia-North Carolina) and in wetlands of central and southern Florida. High altitude photography aircraft can be used for gross vegetation mapping, boundary determination, and selection of sites for intensive study. Low altitude photography is useful for more detailed mapping. Black and white orthophoto quadrangles currently under preliminary stages of preparation in the U.S. Geological Survey will provide up-to-date maps of the swamp at 1:24,000 scale. ERTS (Earth Resources Technology Satellite) provides the big picture--the entire Swamp is visible on one ERTS frame--and permits observation of seasonal change and monitoring of significant ecological shifts. In southern Florida, ERTS provides information for water management in the wetlands north and south of Lake Okeechobee where droughts place significant demands on water that is also needed for maintenance of the Everglades National Park. Water level and precipitation data are collected in near real time by the DCS (Data Collection System). These data are correlated with ERTS imagery that portrays the areal extent of standing water for prediction and management of water flow. (Knapp-USGS)

EXTRACTING LAND USE INFORMATION FROM THE EARTH RESOURCES TECHNOLOGY SATELLITE DATA BY CONVENTIONAL INTERPRETATION METHODS,
National Aeronautics and Space Administration, Houston, Tex. Lyndon B. Johnson Space Center.
P. L. Vegas.
Available from the National Technical Information Service, Springfield, Va 22161, as NASA TN D-7730, Price $3.75 printed copy; $2.25 microfiche. National Aeronautics and Space Administration Technical Note D-7730, July 1974. 54 p, 16 fig, 6 tab, 2 ref, 2 append.

Descriptors: *Land use, *Remote sensing, *Satellites(Artificial), Terrain analysis, Photogrammetry, Mapping, Surveys, *Mississippi.
Identifiers: Harrison County(MS).

Land use data can be extracted from a single frame of Earth Resources Technology Satellite imagery by using various scales and bands when limited to general ground truth and to conventional photointerpretation methods and equipment. More data can be obtained from the imagery by using sequential seasonal frames and more detailed ground truth and by making better use of individual bands and scales as a result of earlier experience. During the experiment, a procedure was developed for extracting selected data from available satellite imagery in a simple and cost-effective manner, with equipment and personnel available at local levels. Harrison County, Mississippi, having a land area of 1515 square kilometers and a population of 132,000 was chosen for the study. For more detailed land use delineation, townships 5, 6, and 7 south in range 10 west in Harrison County were selected. Multispectral scanner imagery in four bands covering the range of wavelengths from 0.5 to 1.1 micrometers was used. The 1:1,000,000-scale transparent film imagery of band 5 was enlarged to scales of 1:250,000, 1:120,000, 1:62,500, and 1:24,000, and the best color composite combination of bands 4, 5, and 7 was enlarged to scales of 1:250,000 and 1:120,000 for interpretation. After a thorough evaluation, the 1:24,000 scale was abandoned as being too vague in resolution for land use purposes or for use as a map base. (Knapp-USGS)

DYNAMICS OF PLAYA LAKES IN THE TEXAS HIGH PLAINS,
Texas Tech Univ., Lubbock. Remote Sensing Lab.
C. C. Reeves, Jr.
Available from NTIS, Springfield, Va. 22161 as N73-33259 Price $3.00 printed copy; $2.25 microfiche. Progress Report for April-September 1973 to Goddard Space Flight Center 1973. 6 p. NASA Contract NAS 5-21720.

Descriptors: *Remote sensing, *Satellites(Artificial), *Playas, *Surveys, *Water balance, *Ecology, Weather data, Water levels, Lakes, Cost-benefit analysis, Texas, Data collections, Data processing.
Identifiers: *ERTS.

ERTS-1 satellite imagery signatures of the water balance ecosystem and geology of select playa lake basins in West Texas were studied at the Double Lakes test site in Lynn County, Texas, and ground-truth of three other small playas was determined. The principal work during the report period consisted of monitoring the weather instruments, the measurement of water levels and water depths, examination of MSS imagery, and measurement of water and mud areas by use of ESIAC (Electronic Satellite Image Analysis Console) at Stanford Research Center, Menlo Park, California. A cost/benefit analysis, comparing the use of ERTS-1 data to more conventionally secured data, revealed that use of ERTS-1 data for such a survey results in a cost reduction from $2.00 to $0.03/square mile. Available from NTIS, Springfield, Va. 22161 as N74-11205 Price $3.00 printed copy; $2.25 microfiche. In: Interdisciplinary Symposium on Advanced Concepts and Techniques in the Study of Snow and Ice Resources, December 2-6, 1973, Monterey, Calif: National Aeronautics and Space Administration Technical Memorandum X-71478, p 5.8-1--5.8-10, 1973. 4 fig, 4 ref.

Descriptors: *Ice, *Sea ice, *Remote sensing, *Infrared radiation, Surveys, Mapping, Data collections, Radar, Microwaves, Temperature, Water temperature, Ice cover, Great Lakes.

Thermal infrared imagery can be used to delineate the relative thicknesses of various regions of freshwater ice, as well as to differentiate new ice from both open water areas and thicker (young) ice. Thermal imagery is generally superior to visual and SLAR imagery for estimating relative ice thicknesses and delineating open water from new ice growth. In a real-time Great Lakes Ice Information System, thermal imagery provide supplementary imagery and also aids in developing interpretative methods for all-weather SLAR imagery. (Knapp-USGS)

Descriptors: *Computer programs, Ecology, *Simulation analysis, Water pollution, Water quality, Statistical models, Ecosystems.
Identifiers: *Aquatic systems, *Community analyses, *Diversity indices.

A detailed description and documentation are presented of a Fortran IV program called 'DIVERSITY'. Developing the program was an effort to solve the difficulties that are apparent when one attempts to evaluate community structures and relationships in an aquatic system and was brought about by the search for a broad-based set of indices and criteria to characterize the selected ecosystems being studied. The program is flexible and applied and has broad capabilities of performing certain functions useful in the summarization and simultaneous evaluation of sets of ecological data and for interpretation and evaluation of community structures. The program calculates diversity indices and tables of numbers and percentages for various arrangements of species into different groupings.

DEVELOPMENTS IN THE PROCESSING OF HYDROLOGICAL DATA IN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research.
M. J. Goodspeed, and J. A. Shaw.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 800-807, 1973. 11 ref.

Descriptors: *Data processing, *Hydrologic data, *Australia, *Digital computers, Current meters, Data collections, Data storage and retrieval, Stream gages, Flow measurement, Discharge measurement, Peak discharge, Information exchange, International hydrological decade.

In Australia, digital computers are used in processing hydrologic data. The use of chart conversion equipment for processing graphically recorded data is now almost standard and a start has been made in the use of recorders which employ computer-compatible media to record the data. Computers are used for rating current meters, calculating river discharges from current meter data, and computing daily and peak discharges, which are usually also stored on magnetic tape for subsequent analysis. In order to facilitate transfer of data between users with a wide range of computers and internal processing systems, standard interchange formats can handle virtually any data comments, and permit the tagging of data to indicate quality attributes. METHODS AND MEANS FOR PREPARING HYDROLOGICAL OBSERVATION RESULTS FOR PROCESSING ON COMPUTERS,
Scientific Research Inst. of Aeroclimatology, Moscow (USSR).
V. I. Grigoriev.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 808-813, 1973. 3 fig.

Descriptors: *Data processing, *Hydrologic data, *Digital computers, *Data storage and retrieval, Stream gages, Flow measurement, Discharge measurement, Information exchange, Water measurement, Water resources development, International hydrological decade.
Identifiers: USSR.

To solve water resources problems, the amount of hydrological information available must be increased, its quality and processing improved, and the transmission of data speeded up. Rapid and high-quality processing of hydrological information is possible only by means of modern computing facilities and, therefore, observational data must be programmed by means of punched cards, punched tapes or special forms for use by computers. Punched tape has advantages over other technical media, as well as being more convenient for storage and transmission. Data can be recorded onto punched tape from hydrological logbooks either by hand or automatically. By using punched tape it is possible to construct a flexible lay-out including all available data. This is very difficult to attain when using punched cards. However, neither punched cards nor punched tapes completely meet the necessary requirements for long-term storage of information. In this case microfilm is used for the creation of an easily available fund of hydrological data. (See also W74-11493) (Knapp-USGS)

ANALOGUE TO DIGITAL CONVERSION AND DATA ACQUISITION FROM CHARTS OF WATER LEVEL AND RAINFALL RECORDERS AND THEIR EVALUATION BY A COMPUTER,
Ruhrtalsperrenverein, Essen (West Germany).
K. Kleinenbroich.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 822-832, 1973. 4 fig, 1 tab.

Descriptors: *Data processing, *Hydrologic data, *Hydrograph analysis, *Digital computers, Data collections, Hybrid computers, Reservoir operation, Networks, International hydrological decade.
Identifiers: *Analog-digital converters, Germany.

By means of an on-line computer connected in the system, hydrographs can be converted into digital form, and the processor can evaluate them exactly, immediately, economically and with great efficiency. The co-ordinate reader can also be used as an off-line system and the computer is able to handle the perforated tapes of flow gages. Analog charts of any kind can be evaluated. The control of a large system of reservoirs in Germany, with fourteen storage basins for water supply of an industrial area is planned using an extended computer for optimization of surplus quantities. MANUAL AND AUTOMATIC EVALUATION OF HYDROMETRIC DATA IN ISRAEL,
Ministry of Agriculture, Jerusalem (Israel). Hydrological Service.
D. Kornitz, and N. I. Levy.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 833-856, 1973. 14 tab, 2 tab.

Descriptors: *Data processing, *Hydrologic data, *Hydrograph analysis, Automation, Data transmission, Data collections, Digital computers, Analog computers, Hybrid computers, Networks, International hydrological decade.
Identifiers: *Israel.

The conventional (manual) methods of computation of hydrological data, as applied in the Israeli Hydrological Service until recently and a newly developed system for automatic processing of hydrometric data are described. The automatic system is an integrated software-hardware graphic system based on an analytical approach. It is a real-time system consisting of a curve follower, processor, display unit, and a teletype for input-output. A plotter for graphic output is optional. This system enables direct processing of hydrological data in the office in a fraction of the time required by conventional means. (See also W74-11493) (Knapp-USGS)

EXPERIENCES WITH A FULLY AUTOMATIC CURVE SCANNER,
Bundesanstalt fuer Gewasserkunde, Coblenz (West Germany).
H. Schafer.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol II, p 857-864, 1973.

Descriptors: *Data processing, *Hydrologic data, *Hydrograph analysis, Analog computers, Digital computers, Hybrid computers, Automation, International hydrological decade.
Identifiers: Germany.

A fully automatic unit was designed for curve scanning and processing of hydrologic data. The unit is described and a report on two years of practical experience gained in its use in the evaluation of stage hydrographs is presented. A comparison with manual evaluation reveals the unit's pronounced superiority in performance and economy. Scanning and evaluation of cross-sections as a prerequisite for hydraulic calculations is also very efficient using the unit. (See also W74-11493) (Knapp-USGS)

SIDES: STORET INPUT DATA EDITING SYSTEM,
Environmental Protection Agency, Athens, Ga.
D. R. Barrow.
Available from NTIS, Springfield, Va 22161 as PB-227 052, Price $5.25 printed copy; $2.25 microfiche. Surveillance and Analysis Division (Region IV) Report, January 1973. 31 p, 1 fig.

Descriptors: *Computer programs, *Data storage and retrieval, *Data processing, *Water quality, Hydrologic data, Data collections.

The STORET Input Data Editing System (SIDES) is composed of five programs: PFSTO1, PFSTO2, PFSTO3, PFSTO4, and PFSTO5. SIDES was developed for application to field study data where several sets of data are collected at the same stations over a relatively short period of time. Specifically it was designed to improve data quality control and reduce turn around time between field study and report preparation. However it should find wide application to any system which handles repetitive sampling and analysis from a fixed station network. The system provides an easy-to-use card format for entering data into STORET particularly with respect to sample identification, a comprehensive pre-STORET editing system including immediate printouts to facilitate checking numerical data, and a simplified method for correcting data already entered into STORET. SURFACE-WATER AVAILABILITY, TALLADEGA COUNTY, ALABAMA,
Geological Survey, University, Ala.
J. R. Harkins.
Alabama Geological Survey Map 112, 1972. 15 p, 5 fig, 2 map, 1 tab, 12 ref.

Descriptors: *Water resources, *Surface waters, *Maps, *Alabama, Low flow, Water yield, Streamflow, Hydrologic data, Data collections, Base flow.
Identifiers: *Talladega County(Ala).

The surface-water hydrology of Talladega County, Alabama, was analyzed and mapped to present the hydrologic information for quick visual appraisal. Average runoff, within the county, is about 0.9 mgd per square mile. Inflow into the county is about 7,600 mgd. The median annual 7-day low flow is well sustained by large quantities of spring flow. Streams in the county have a combined channel length of approximately 100 miles with 7-day low flow in excess of 2 mgd; 50 miles are in the 10 to 100 mgd range and 13 miles are in the 100 to 1,000 mgd range. The Coosa River, which is the western border of the county, has a 7-day low flow in excess of 1,000 mgd and storage of 622,400 acre-feet. The chemical quality of the water is good for most uses. (Knapp-USGS)
W74-11767

A TECHNIQUE FOR INTERPRETATION OF MULTISPECTRAL REMOTE SENSOR DATA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
A. N. Williamson.
Available from NTIS, Springfield, Va. 22161 as N73-31312 Price $3.00 printed copy; $2.25 microfiche. September 1973. 15 p.

Descriptors: *Remote sensing, *Satellites(Artificial), *Chesapeake Bay, *Water quality, *Data processing, Turbidity, Path of pollutants, Solar radiation, Data collections, Computer programs.
Identifiers: *ERTS.

ERTS-1 satellite data can be used to detect alterations to the absorption and scattering properties caused by movement of suspended particles and solutes in the Chesapeake Bay and to delineate flow patterns, flushing action of the estuary, and sediment and pollutant dispersion. Techniques have been developed that permit automatic interpretation of data from any multispectral remote sensor with computer systems which have limited memory capacity and computing speed. The multispectral remote sensor is considered a reflectance spectrophotometer. The data which define the spectral reflectance characteristics of a scene are scanned pixel-by-pixel. Each pixel whose spectral reflectance matches a reference spectrum is identified, and the results are shown in a map that identifies the locations where spectrum matches were detected and spectrum that was matched. ENCROACHING SALT WATER IN NORTHEAST PALM BEACH COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
H. G. Rodis.
Florida Bureau of Geology Map Series No 59, 1973. 1 sheet, 6 fig, 4 photo.

Descriptors: *Saline water intrusion, *Aquifers, *Surface waters, *Florida, Withdrawal, Drainage systems, Canals, Saline water-freshwater interfaces, Surface-groundwater relationships.
Identifiers: *Palm Beach County(FL), *Loxahatchee River(FL).

Seawater is encroaching inland in northeast Palm Beach County and adjacent parts of Martin County. It threatens the freshwater resources of growing coastal communities and a river. In the early 1900's, man began to drain the Everglades to make additional land available for farms and homes and began to connect lakes and streams to the sea. The flow of freshwater to the estuary and into the shallow aquifer gradually diminished, thereby changing the balance between the freshwater and saltwater environments and causing saltwater to move inland. Today, saltwater tides reach the upper Loxahatchee River (northeast fork), destroying freshwater flora and fauna. Saltwater, no longer held back by highwater levels, is encroaching into the shallow aquifer. Parts of the salt front near heavily pumped municipal and irrigation wells have advanced inland about 1/2 mile. The upper reach of the Loxahatchee River is one of the last remaining natural rivers in south Florida. The river requires a sustained flow of freshwater to nourish plant and animal communities and to prevent saltwater from moving farther upstream. Except for occasional floods, the flow of freshwater has diminished at an accelerated rate, as rainfall runs off quickly through an expanding system of drainage canals. During the 1970-71 drought, the flow of the river was about 200 gpm. A sustained flow many times greater than this is necessary to maintain the freshwater environment of the river, even in part. Potential freshwater resources are available from the shallow aquifer in areas west of the present well fields. Treated sewage and storm runoff could be used to irrigate golf courses or to maintain a head of freshwater at the fresh, salt water interface. Much of the remaining freshwater environment of the Loxahatchee River can be maintained by a sufficient flow of freshwater. This could be provided by diverting enough freshwater from inland canals and water-storage areas to the river to retard the advance of saltwater. Preventing upstream movement of saltwater tides by constructing a salinity barrier, dam, or lock downstream also would aid in maintaining the freshwater environment. (Knapp-USGS)

HYDROGEOLOGICAL MAPS OF KOREA, 2. UPPER JINWI RIVER BASIN, (IN KOREAN),
Korea Geological and Mineral Inst., Seoul.
J. U. Lim, and J. W. Kim.
Geological Survey of Korea, Seoul, 1972. 39 p, 17 fig, 8 tab.

Descriptors: *Hydrogeology, *Water resources, *Hydrologic data, *Maps, *Aquifer characteristics, Aquifers, Areal hydrogeology, Groundwater basins, Hydrology, Hydrologic aspects, Surveys, *Water wells, Aquifer testing, Hardness(Water), Alkalinity, Chemical properties, Water quality, Water properties, Topography.
Identifiers: *Korea(Upper Jinwi River Basin).

Two hydrogeological maps describe the groundwater resources of the upper part of the Jinwi River basin, an area of 357 square km, in the middle part of the Korean peninsula. Delineated are the alluvial sand and gravel aquifers, data on the hydrologic properties and chemical quality of groundwater. Locations of wells, test holes, and other data collection points are identified by a coordinate system shown on a well-numbering diagram. Pump test data are tabulated for 183 wells. Eighteen chemical constituents of the water are tabulated for 61 wells. An English explanatory text is included. (Humphreys-ISWS)
W74-11908

FLOOD-PLAIN AREAS OF THE LOWER MINNESOTA RIVER.
Geological Survey, Saint Paul, Minn.
Water-Resources Investigations 15-74 (open-file map index report), 1973. 12 plates.

Descriptors: *Floods, *Minnesota, *Flood plains, Flood plain zoning, Flood protection, Stage-discharge relations, Flood profiles, Backwater, Flood data.
Identifiers: *Minnesota River.

The flood-plain of the lower Minnesota River was studied from the mouth to Carver Rapids, 36 miles upstream. In this reach, there are flood-plain lands subject to recurrent flooding within the unincorporated areas of Scott and Carver Counties and 11 municipalities. The primary purpose of this study is to provide the information needed for adoption and administration of local flood-plain regulations. The hydrologic data contained can be used to evaluate the extent, depth, and frequency of flooding that will affect economic development of flood-plain areas in the lower Minnesota River valley. Designated floodways are shown for the entire study area. The effect of planned encroachment, by development to the limits of these floodways, is evaluated and incorporated into flood protection elevation profiles. Flooding in the study area results not only from flows originating within the Minnesota River basin, but also from flows originating in the Mississippi River upstream from the mouth of the Minnesota River. SELECTED HYDROLOGIC DATA IN THE UPPER COLORADO RIVER BASIN,
Geological Survey, Washington, D.C.
D. Price, and K. M. Waddell.
Hydrologic Investigations Atlas HA-477, 1973. 2 sheets, 3 tab, 4 graphs, 9 maps, 57 ref.

Descriptors: *Water resources, *Colorado River, *Arizona, *Colorado, *New Mexico, *Utah, *Wyoming, Colorado River Basin, Groundwater, Hydrogeology, Aquifers, Water quality.

The groundwater resources of the upper Colorado River basin are described in a 2-sheet hydrological atlas. The maps in this atlas are highly generalized, and are intended to provide only a general understanding of the geology, groundwater conditions, and chemical quality of water in the basin as a whole. Rocks ranging in age from Precambrian to Holocene are exposed in the Upper Colorado River basin. The rocks have been grouped into five basic geohydrologic units on the basis of age and general lithologic characters. Alluvium in geohydrologic unit 1 and volcanic rocks in geohydrologic unit 2 contain aquifers that have the highest hydraulic conductivities. Yields to individual wells and springs generally are small in most parts of the basin. Properly located and constructed wells in the thicker (100 ft or more) alluvial deposits yield 500 to more than 1,000 gpm, and some of the most productive wells in the entire basin tap both alluvium and volcanic rocks in the upper Fremont River valley, where several wells yield more than 1,000 gpm. Only about 5 percent of the maximum estimated volume of groundwater stored in the basin is in unconsolidated deposits that have high hydraulic conductivities. About 85 percent of the maximum estimated volume of stored water occurs in the rocks of geohydrologic units 3, 4, and 5, which generally yield the water slowly; and much of that water is moderately to highly mineralized. Hydrographs of wells indicate that there have been no significant depletions of storage in the basin owing to groundwater development. (Knapp-USGS)

Interpretive Report 5 (Map MF-526), 1974. 1 fig, 1 map, 4 tab, 15 ref.

Descriptors: *Surface waters, *Data collections, *Basic data collections, *California, *Land use, Planning, Water quality, Water utilization, *Pollutant identification.
Identifiers: *San Francisco Bay(CA).

Surface-water resources in the San Francisco Bay region are discussed and sources of data are shown on a map. Water-quality criteria and important pollutants are discussed in relation to the water quality recommended for intended beneficial uses. Water-quality objectives recommended by the California Water Quality Control Board for streams, other water bodies, and drainage basins are reviewed. Examples of the kinds of problems that require decisions by planners and government officials are given. (Knapp-USGS)

WATER RESOURCES OF THE LARAMIE, SHIRLEY, HANNA BASINS AND ADJACENT AREAS, SOUTHEASTERN WYOMING,
Geological Survey, Washington, D.C.
M. E. Lowry, S. J. Rucker, IV, and K. L. Wahl.
Hydrologic Investigations Atlas HA-471, 1973. 4 sheets, 14 fig, 5 tab, 10 maps, 36 ref.

Descriptors: *Water resources, *Data collections, *Wyoming, *Hydrologic data, Water yield, Groundwater, Surface waters, Duration curves, Surface-groundwater relationships, Groundwater basins, Water quality.
Identifiers: Laramie Basin(WY).

The availability and quality of groundwater and flow characteristics and quality of water in the major streams were studied in the Laramie Basin, the Shirley Basin, and the Hanna Basin, all in southeastern Wyoming. Tremendous quantities of water are present in rocks underlying the area. Considering only the sandstone, which may average more than 10 percent porosity, there would be in excess of 64 acre-feet of water stored in a sandstone 1 foot thick and 1 mile square. Groundwater suitable in quantity and quality for stock use is generally available at depths of 500 feet or less. Most wells for which data are available are used for stock or domestic supplies. Flow-duration curves show the distribution of daily discharges for the period for which the curve is compiled. There is, in most places, a free exchange of water between streams and flood-plain deposits to the extent that any significant change in the quantity in one will be reflected in the other. No areas were identified during this study where perennial streams lose water to bedrock formations. The most prevalent condition is typified by that in the Laramie Basin. There, the areal relations of water in bedrock to water in the Little Laramie and Laramie Rivers indicate that bedrock underlying the flood plain of these rivers is not sufficiently permeable to measurably affect the flow of the Laramie River by either increasing or decreasing discharge. HYDROLOGIC DATA FOR COW BAYOU BRAZOS RIVER BASIN TEXAS, 1972,
Geological Survey, Austin, Tex.
J. K. VanZandt.
Open-file report, May 1974. 72 p, 3 fig, 3 tab.

Descriptors: *Hydrologic data, *Small watersheds, *Texas, Rainfall-runoff relationships, Storm runoff, Flood control, Dams, Reservoirs, *Data collections, Basic data collections.
Identifiers: Cow Bayou(TX).

Rainfall, runoff, and storage data collected during the 1972 water year for the 85.0-square-mile area above the stream-gaging station Cow Bayou at Mooreville, Texas are reported. The location of floodwater-retarding structures and hydrologic in-

struments in the area are shown. There are 26 floodwater-retarding structures in the watershed upstream from the stream-gaging station at Mooreville. The weighted-mean rainfall over the study area during the 1972 water year was 29.45 inches, or 90 percent of the 14-year (1959-72) average of 32.65 inches. Yearly mean discharge at the stream-gaging station was 20.1 CFS, compared with the 14-year average of 35.2 CFS. Annual runoff at the stream-gaging station was 14,600 acre-feet. (Knapp-USGS)

HYDRAULICS OF MAIN CHANNEL-FLOODPLAIN FLOWS,
Oklahoma State Univ., Stillwater. School of Agricultural Engineering.
C. E. Rice.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-235 263; $3.25 in paper copy, $2.25 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, Completion Report, (1974). 31 p, 9 fig, 6 tab, 2 ref. OWRTA-030-OKLA(1). 14-31-0001-4036.

Descriptors: *Channels, *Flood plains, *Uniform flow, Flood waves, *Unsteady flow, Slopes, Hydraulics, *Open channel flow.
Identifiers: *Combined channels, Manning coefficient.

A tilting frame with a main channel-floodplain combined channel 44-feet long was used to run steady and unsteady flow tests with three surface roughnesses at five different slopes. The major objective was to evaluate, from physical experiments, the effect of floodplain flow on the flow in the main channel. Also, methods of computing uniform flow discharges in a combined channel and flow wave movement through a combined channel reach were studied. The floodplain appeared to have a significant retarding effect on the main channel flow and the combined channel Manning Coefficient increases as the floodplain width increased relative to the main channel width. The hydraulic radius as ordinarily computed in a regular channel resulted in erroneous discharge values for a combined channel in the depth range immediately above bank-full stage of the main channel. None of the methods commonly to compute uniform flow discharge in a combined channel gave good results over the complete range of flow depths for the main channel-floodplain combination. Except at very shallow floodplain depths, there was no difference in water surface elevation between the main channel and floodplain sections during the passage of a flood wave through the channel reach. The forward and backward characteristic equations of the unsteady flow equations, solved using an explicit finite difference representation and centered difference scheme, did an adequate job of routing the flood waves through the combined channel into the main channel and floodplain sections and assuming a horizontal transverse water surface for the channel.

WAVE TRANSMISSION THROUGH POROUS STRUCTURES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
O. S. Madsen.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 100, No WW3, Proceedings Paper 10714, p 169-188, August 1974. 2 fig, 1 tab, 10 ref, 3 append.

Descriptors: *Breakwaters, *Porous media, *Ocean waves, *Coastal structures, Hydraulic structures, Sea wall, Shore protection, Engineering structure, Hydraulic conductivity, Waves(Water), Wave action, Unsteady flow, Hydraulic properties, Energy dissipation, Transmissivity, Currents(Water).
Identifiers: *Wave propagation, *Wave interference, Reflective coefficients.

Assuming long, normally incident waves on a homogeneous porous structure of rectangular cross section, a simple explicit solution for the transmission and reflection coefficients were obtained from a linearized theory. The relationship between the nonlinear flow resistance in the porous medium and its equivalent linear form was obtained in explicit form. Empirical relationships for the nonlinear flow resistance are reviewed and shown to lead to acceptable estimates of the hydraulic properties of a porous medium. Using the empirical relationships for the hydraulic properties of a porous material in conjunction with the explicit simple solution for the reflection and transmission coefficients leads to results comparable to the results of other more time-consuming procedures. NONLINEAR WAVE FORCES ON HALF-CYLINDER AND HEMISPHERE,
Chicago Bridge and Iron Co., Plainfield, Ill. Marine Research and Development.
S. K. Chakrabarti, and R. A. Naftzger.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 100, No WW3, Proceedings Paper 10710, p 189-204, August 1974. 9 fig, 3 tab, 15 ref, 3 append.

Descriptors: *Ocean waves, *Wave action, *Waves(Water), *Flow around objects, Deep water, Potential flow, Harbors, Structures, Storage tanks, Oil, Hydraulics.
Identifiers: *Nonlinear wave forces, *Offshore structures, Submerged structures.

Explicit expressions are derived for the pressures and forces on a deeply submerged, bottom seated halfcylinder and hemisphere due to Stokes' nonlinear gravity waves up to fifth order. The reflection of the waves due to the presence of the object is included in the analysis. The flow is taken to be irrotational, and the effect of the free surface on the reflected wave components is neglected, assuming deep submergence of the object. For both shapes, the theoretical forces are compared with the analytical and experimental force data published for small amplitude, first-order waves. (Humphreys-ISWS)

CIRCULAR JUMPS,
Sargent and Lundy, Chicago, Ill.
S. C. Mehrotra.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY8, Proceedings Paper 10758, p 1133-1140, August 1974. 5 fig, 5 ref, 2 append. NSF Grant GA-31247.

Descriptors: *Hydraulic jump, *Weirs, *Control, *Specific head, Momentum equation, Hydraulics, Critical flow, Transition flow, Flow control.
Identifiers: *Circular hydraulic jump, Radial flow.

Circular jumps of radial flows on a horizontal circular disk mounted with a peripheral weir were studied theoretically for their location and strength on an inviscid and hydrostatic basis. Unlike their two-dimensional counterpart, stationary circular jumps form for a range of weir heights for prescribed upstream conditions, and their location and strength can be found for any weir height within this range on an inviscid basis. The significance of a circular jump lies in its eminent amenability to treatment on a relatively simple basis. (Humphreys-ISWS)

C. C. Mei, P. L-F. Liu, and A. T. Ippen.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 100, No WW3, Proceedings Paper 10754, p 217-239, August 1974. 3 fig, 2 tab, 15 ref, 3 append. NSF Grant GK-4243.

Descriptors: *Waves(Water), *Coastal engineering, *Breakwaters, Wave action, Energy loss, Wavelengths, Shallow water, Harbors, Currents(Water), Flow separation, Mathematical studies, Analytical techniques.
Identifiers: *Harmonic analysis, Quadratic forms, Long waves, Constrictions.

A wave train past sharp convex corners or narrow passages may suffer energy loss due to flow separation. Representing the energy loss by a surface drop proportional to the square of the local velocity, the effects incurred on the wave train are studied theoretically for one-dimensional transmission problems. When the constriction is asymmetrical, an induced current is found along with the radiation of higher harmonics. (Humphreys-ISWS)

CHANNEL FRICTION AND SLOPE EFFECTS ON HARBOR RESONANCE,
State Univ. of New York, Buffalo. Dept. of Engineering Science.
R. P. Shaw, and C-K. Lai.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 100, No WW3, Proceedings Paper 10706, p 205-215, August 1974. 10 fig, 9 ref, 3 append.

Descriptors: *Coastal engineering, *Harbors, *Inlets(Waterways), Ocean waves, Ocean currents, Surface waters, Currents(Water), Wavelength, Vibration, Channel flow, Channels, Friction, Slopes, Velocity, Hydraulics.
Identifiers: Harbor resonance, Ocean engineering.

An approximate matching technique uses separate solutions in a semi-infinite ocean bounded by a

straight coastline, a harbor basin, and a narrow straight entrance channel which connects them. Wave height and velocity are matched at the interfaces. Such an approach allows different solutions to be used in any of the three regions, when the physical description of that region is modified, without changing the solutions used in the remaining regions. The entrance channel is first considered to possess a wall/bottom friction although the remaining regions are kept frictionless. Results indicate that the channel effect, which leads to increasing resonance amplification with increasing channel length analogous to the well-known harbor paradox, is counteracted by the increase in frictional effects for a longer channel. The second problem considered modified the entrance channel to have a linear slope from a constant depth ocean to a harbor basin at some other constant depth. (Humphreys-ISWS)

FLOW OVER SIDE-WEIRS,
Indian Inst. of Tech., Kanpur. Dept. of Civil Engineering.
K. Subramanya, and S. C. Awasthy.
In: Symposium on Hydrometry, September 1970, Koblenz, West Germany: International Association of Hydrological Sciences Publication No 99, Vol I, p 328-335, 1973. 4 fig, 1 tab, 5 ref.

Descriptors: *Weirs, *Stage-discharge relations, *Discharge coefficient, Flow measurement, Discharge measurement, Hydraulic models, International hydrological decade.
Identifiers: Side-weirs.

Flow over sharp-edged side-weirs in rectangular channels was analyzed. The parameters affecting the coefficient of discharge were identified and an expression was derived analytically for the variation of the discharge coefficient of a side-weir of zero height with the Froude number of upstream main channel flow. The experimental data show a very good agreement with this expression. The discharge coefficient of side-weirs of finite height was also studied experimentally and is essentially the same for the corresponding side-weir of zero height. (See also W74-11493) (Knapp-USGS)

Descriptors: *Stratified flow, *Flow profiles, *Interfaces, *Research facilities, Continuity equation, Density currents, Fluid friction, Free surfaces, Hydraulics, Impounded waters, Momentum equation, Nonuniform flow, Saline water - fresh water interfaces, Steady flow, Thermal stratification.
Identifiers: *Hypolimnetic flow regimes, *Experimental open-channel flume, *Interfacial profile equations.

The 'hypolimnetic flow' is a two-layered flow with the upper layer stagnant. This report presents the possibility of different flow regimes for the hypolimnetic flow which may be determined from the parameters of slope of channel bottom, flow depth, flowrate, density difference of water in the two layers, and channel roughness. The analysis is limited to the steady-state case of the hypolimnetic flow and the 'upper layer analysis' in which the lower layer is stagnant. Interfacial profile equations which predict possible existence of ten different flow regimes for the hypolimnetic flow and two regimes for the upper layer analysis were obtained from the equations of continuity and momentum for two-layered flow. Experimental apparatus, consisting of a large scale open-channel tilting flume and water supply and control systems capable of circulating water of two different temperatures was designed and constructed. The experiment employed observations of a dyed flow layer and measurements of vertical temperature distributions in the flume. It was found that eight different flow regimes could be generated in the flume for the hypolimnetic flow on the positive and horizontal slopes. (EPA)

LEAST COST DESIGN OF BRANCHED PIPE NETWORK SYSTEM,
Weston (Roy F) Inc., West Chester, Pa.
A. K. Deb.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE4, Proceedings paper No. 10711, p 821-835, August 1974. 4 fig, 4 tab, 8 ref.

Descriptors: *Water distribution(Applied), *Networks, *Design, Costs, *Pipe flow, *Environmental engineering, Hydraulics, Economics, Optimization, Hazen-Williams equation, Head loss, Size, Variability, Mathematical models, Systems analysis.
Identifiers: *Cost minimization, Branched pipe networks.

A new method is presented for the direct least cost solution of pipe sizes of a branched pipe network of known geometry consisting of pumping station and network of pipes for known water consumptions incorporating various cost functions. The method gives optimum distribution of total head loss among the various branches and pipes of the system, and the Hazen-Williams equation is used in obtaining least cost pipe sizes for an assumed total head loss in the system. The effects of the variation of total head loss on the total cost of the pipe network are studied. This method is simple and can be used efficiently for least cost design of branched water main systems only, with the aid of a desk calculator. A systematic procedure of calculation is described and illustrated using two sample problems. (Bell-Cornell)

VISCOUS DRAG REDUCTION IN DEVELOPING PIPE FLOW,
Colorado State Univ., Fort Collins. Engineering Research Center.
J. P. Tullis, and K. L. V. Ramu.
Available from NTIS, Springfield, Va 22161, as AD-771 456, Price $3.50 printed copy; $2.25 microfiche. Hydro Machinery Laboratory Report No 34, November 1973. 54 p, 41 fig, 8 tab, 40 ref. Navy Contract N00014-67-A-0299-0021.

Descriptors: *Flow friction, *Drag, *Turbulent flow, *Polymers, Hydraulics, Fluid mechanics, Flow resistance, Viscosity.
Identifiers: *Drag reduction.

Turbulent flow in the entrance region of a rough pipe was studied for pure water flow and with polymer injection into a boundary layer. A mathematical model was developed for predicting boundary layer thickness, core velocity, and pressure coefficient in the inlet region. Drag reductions above 90% were observed in the inlet region. In the fully developed region the maximum drag reduction measured was 80% at 25 ppm. At the highest concentration used (74 ppm) the drag reduction was only 74%. Drag reduction in the inlet region appeared to be independent of injection concentration. Velocity profiles generally followed the Meyer model in the fully developed region but significantly deviated from it in the entry region. The velocity profile, diffusion and drag reduction were strongly dependent on the Reynolds number. (Knapp-USGS)

SPILLWAY CREST DESIGN,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
T. E. Murphy.
Available from NTIS, Springfield, Va 22161 as AD-774 802, Price $3.00 printed copy; $2.25 microfiche. Miscellaneous Paper H-73-5, December 1973. 9 p, 3 plate, 1 tab, 3 ref.

Descriptors: *Spillway crests, *Design, *Hydraulic design, *Design flow, Spillways, Dams, Hydraulics.
Identifiers: *Spillway design.

A method is given for design of the weir crest for any depth of approach or inclination of the upstream face of the spillway. The curvature of the crest is most critical immediately upstream from the crest line, in the vicinity of the crest line, and for a vertical distance of no more than one design head downstream from the crest line. There should not be a discontinuity at the intersection of the spillway crest and the upstream face of the dam. With flow at the design head, the downstream profile should result in zero pressure on the spillway crest for a vertical distance of about one design head downstream from the crest line. Tests are proposed in order to provide specific design data. (Knapp-USGS)

EMBANKMENT DEFORMATIONS DUE TO WATER LOADS,
Sydney Univ. (Australia). School of Civil Engineering.
J. R. Booker, and H. G. Poulos.
Available from NTIS, Springfield, Va. 22161 as PB-228 454 Price $5.00 printed copy; $2.25 microfiche. Research Report No R-224, September 1973, 38 p, 24 fig, 10 ref.

Descriptors: *Dams, *Deformation, *Loads(Forces), Load distribution, Earth pressure, Soil pressure, Pressure, Weight, Earth dams, Soil mechanics, Engineering structures, Hydraulic structures.

The stresses and deformations within an embankment due to water loading acting on the upstream face were calculated and a parametric study was made of the variables affecting the deformations. A basic series of solutions was obtained for a homogeneous embankment and the effects of water level, embankment slope, and Poisson's ratio were investigated. Deformations increase as embankment slope or Poisson's ratio increase, and very large increases in deformations occur as the water level approaches the top of the embankment. Some evidence of this phenomenon was found in cast records relating to earth dams. (Knapp-USGS)

Descriptors: *Reviews, *Polymers, *Drag, Turbulent flow, Hydraulics, Hydrodynamics, Flow resistance, Flow friction, Fluid friction, Turbulence.
Identifiers: *Drag reduction.

Changes in turbulence structure brought about by addition of polymers to water are reviewed, and an effort is made to explain these in the light of recent advances in the study of shear flow turbulence in ordinary fluids. A simplified theoretical model of shear flow wall turbulence is presented, with the aid of which an exploratory study of the influence of some non-Newtonian fluid properties is carried out. With extremely high-molecular-weight polymers only a few parts per million of weight of solvent is sufficient in some cases to lead to drag reductions of 50% or more. Generally, the emphasis in this review is on the more recent contributions, particularly those having a bearing on turbulence structure, but some of the older material of interest for giving the background is also included. (Knapp-USGS)

Available from NTIS, Springfield, Va. 22161 as AD-771 626 Price $3.75 printed copy; $2.25 microfiche. Water Resources and Hydrodynamics Laboratory Contract Report, 1971. 32 p, 12 fig. ONR Contract N00014-67-A-264-0036 NFS Grant-GK4243.

Descriptors: *Refraction(Water waves), *Piles(Foundations), Equations, Waves(Water), Hydraulics, Coastal engineering, Coastal structures.
Identifiers: *Diffraction(Water waves).

The diffraction of water waves by a vertical pile extending over the full depth is essentially the same as the two-dimensional diffraction of sound waves by a cylinder, and the theory for some simple shapes can be regarded as known. A vertical cylinder extending over part of the water depth is considerably more difficult. Upon comparison with the exact solution for the limit case of a full cylinder, numerical difference appears to exist over ranges of practical interest. The case of a totally submerged circular resting on the sea bottom is also of engineering (storage tanks) as well as oceanographic (submarine islands) significance. Calculations for both cases were made by incorporating the Rayleigh-Ritz procedure to insure a desired accuracy in far field quantities, and by using Haskind's theorem for wave forces. (Knapp-USGS)

FREE SURFACE SLOPES AT CONTROLS IN CHANNEL FLOW,
New South Wales Univ., Manly Vale (Australia).
D. L. Wilkinson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 100, No HY8, Proceedings Paper 10753, p 1107-1117, August 1974. 7 fig, 2 ref, 2 append.

Descriptors: *Flow control, *Channels, *Open channel flow, *Weirs, Control, Hydraulics, Discharge(Water), Continuous flow, Steady flow, Critical flow, Transition flow, Cross-sections, Flow profiles, Overflow, *Slopes.

The slope of a free water surface in steady open channel flow is indeterminate at a control section. The surface slope is finite and, subject to certain approximations, determinate. Expressions were derived for the surface slopes of critical flows over a smooth weir and through a smooth contraction. Experiments confirmed the validity of these expressions up to surface slopes of arc tan 0.3 for weirs and arc tan 0.8 for contractions. It was shown that the same expressions could have been obtained using the one-dimensional energy equation, even though the assumption of hydrostatic pressure is not valid. The expression derived for the water surface slope yielded a well-conditioned equation for numerical calculation of water surface profiles through a control. Using surface slope at a control section as a rating parameter is a possibility. (Humphreys-ISWS)

SURFACE-WAVE TRANSPORT IN NONUNIFORM CANALS,
Hawaii Univ., Honolulu. Inst. of Geophysics.
R. W. Preisendorfer.
Available from NTIS, Springfield, Va. 22161 as COM-73-10404, Price $3.00 printed copy; $2.25 microfiche. Report HIG-72-18 (NOAA-JTRE-80), July 1972. 372 p, 17 ref. NSF Grant AG-253.

Descriptors: *Waves(Water), *Unsteady flow, *Open channel flow, *Numerical analysis, Nonuniform flow, Computer programs, Mathematical models, Tides, Bores, Canals, Regime, Water conveyance.
Identifiers: Linear canal theory.

The boundary value problems of water wave propagation in classic linear canal theory are completely reformulated in terms of the transport concepts of reflection and transmission of nonuniform canal segments and abrupt junctions. This results in a relatively efficient numerical approach to the problem of predicting water wave elevations in nonuniform canals subsequent to invasion by external waves at the ends of the canal. The treatment rests on two key ideas. The first idea is to conceptually split the surface-wave elevation into two counter-flowing waves in such a way as to be valid even in the nonuniform portions of canals; these wave components are governed by a pair of coupled first order linear ordinary differential (the two-flow) equations equivalent to the original classic second order canal equation. The second idea is to decompose a canal into simple modules whose reflectance and transmittance properties are determined numerically or analytically from the two-flow equations. These module properties are recombined according to algebraic rules developed in the transport approach to canal water waves, thereby permitting a wide variety of canal configurations constructible from a small set of modules. The two-flow theory complements the classic theory in supplying relatively simple formulas that characterize the boundary value problems directly in terms of canal geometry. (Knapp-USGS)

SPILLWAY FOR LOCK AND DAM 26, MISSISSIPPI RIVER, MISSOURI AND ILLINOIS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
N. R. Oswalt, and G. A. Pickering.
Available from NTIS, Springfield, Va 22161 as AD-768 780, Price $3.50 printed copy; $2.25 microfiche. Technical Report H-73-15, October 1973. 62 p, 12 fig, 25 plate, 1 ref.

Descriptors: *Spillways, *Gates, *Mississippi River, Hydraulics, Hydraulic models, Bank protection, Locks, *Missouri, *Illinois.

Tests were conducted on two models of the Lock and Dam 26 spillway on the Mississippi River in Missouri and Illinois to determine discharge characteristics of the spillway, stilling basin performance, riprap requirements downstream from the structure, and gate vibration tendencies. The stilling basin as originally designed resulted in unsatisfactory performance with only one gate open full. Several modifications to the basin were tested in an effort to effect better energy dissipation and spread flow downstream during single-gate operations. A stilling basin that resulted in satisfactory flow conditions was developed. Riprap will be needed for a distance of 1200 ft downstream from the basin. No vibrations will occur in the gates with the range of flow conditions expected for the project. Gate openings and tailwater elevations required to pass ice and debris were also determined. HIGH-PRESSURE MECHANICAL PROPERTIES OF KAYENTA SANDSTONE,
California Univ., Livermore. Lawrence Livermore Lab.
A. G. Duba, A. E. Abey, B. P. Bonner, H. C. Heard, and R. N. Schock.
Available from National Information Service, Springfield, Va., 22161 as UCRL-51526, $4.00 paper copy, $2.25 in microfiche. Report No UCRL-51526, February 1974. 25 p, 11 fig, 3 tab, 25 ref.

Descriptors: *Stress analysis, *Sandstones, Physical properties, *Strain measurements, *Rock mechanics, Conductivity, Ultrasonics, Nuclear explosions, Testing, Underground, Subsurface investigations, Porosity, Model studies, Shear.
Identifiers: *Kayenta sandstone, *Pressure-volume relationship(Sandstone), Stress-strain measurements.

The mechanical response of materials to the large stress pulses typical of high-energy and nuclear explosives is a matter of importance for site hardening, as well as stemming and containment, in the underground testing program of the Defense Nuclear Agency (DNA). To improve computer modeling techniques and to study the response of a porous sandstone, the Mixed Company event, a well-instrumented experiment using high-energy explosives, was performed at a site in Mesa County, Colorado. Pressure-volume, uniaxial strain loading, uniaxial stress loading to failure, and ultrasonic velocity determinations have been performed on samples of Kayenta sandstone from the site of the Mixed Company event. The experimental procedure and test results are given. (Houser-ORNL)

INDEXED BIBLIOGRAPHY ON CORROSION AND PERFORMANCE OF MATERIALS IN SALINE WATER CONVERSION PROCESSES-15.
Oak Ridge National Lab., Tenn.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 488/AS, $3.75 in paper copy, $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-959, June 1972, 41 p. OSW-AEC Agreement 14-01-0001-2535, Work Order No 12.

Descriptors: *Bibliographies, *Corrosion, Corrosion control, *Desalination, Performance, *Materials.

Abstracts are given for 75 publications relating to the corrosion and performance of materials of construction used in saline water conversion processes. The publications abstracted include research and development reports issued by the Office of Saline Water, as well as articles appearing in the open literature. The major portion of the report is a reproduction of a computer printout of information stored in a computerized storage and retrieval system for the Materials Information Center of the Office of Saline Water (OSW-MIC) located at the Oak Ridge National Laboratory. The abstracts contained in this report are grouped in 18 categories and are repeated if they fall into more than one category. An author index and a keyword index to the reports referenced are included. The keywords, used to identify the contents of a publication, have been selected from a thesaurus of approximately 839 words developed by the Center. (OSW)

G. H. Higgins, T. R. Butkovich, and D. Montan.
Available from National Technical Information Service, Springfield, Va., 22161 as Report No UCRL-51512; $4.00 paper copy, $2.25 in microfiche. Report No UCRL-51512, January 16, 1973. 15 p, 6 fig, 2 tab, 10 ref.

Descriptors: *Secondary recovery(Oil), *Natural gas, *Nuclear explosions, *Explosions, *Chemical potential, Comparative benefits, Comparative costs, Hydraulic engineering, Geology, Rock mechanics, Economics, Onsite tests.
Identifiers: *Hydraulic fracturing, Project Rulison, Plowshare.

Long, continuous, cylindrical charges of high explosives are considered as alternatives to nuclear explosives or massive hydraulic fracturing for the stimulation of gas production in tight gas formations. The calculational method was that used previously for nuclear stimulation; it was verified by comparison of the calculated and observed gas production from Rulison. The calculations indicate that charges of high explosives 24 inches in diameter and 2000 feet in length (the height assumed for the gas-bearing sands) detonated in four wells per section would be comparable in cost and effectiveness to estimates for one well stimulated by three 100-kiloton nuclear explosions. Stimulation by high explosives would require special development of the explosives (probably with ammonium nitrate as the base) to be suitably sensitive, temperature-resistant, and compatible with the gas-reservoir rocks; the required work appears to be straightforward, however. Comparative field testing is required to determine the optimum method (chemical or nuclear explosives or hydraulic fracturing) for a given region and to confirm that gas can be produced profitably for between $0.25 and $0.80 per Mcf. (Houser-ORNL)

DIRECTED EXPLOSIONS--EXPERIENCE AT MEDEO,
A. N. Romashov.
Available from NTIS, Springfield, Va 22161 as AD-771 657, Price $3.25 printed copy; $2.25 microfiche. Air Force Foreign Technology Division Wright-Patterson AFB, Ohio, Machine Translation Report FTD-MT-24-326-74, November 1973. 22 p, 4 fig. (Translated from Priruda, No 3, p 61-67, 1968).

Descriptors: *Dams, *Earth dams, *Explosions, Craters, Excavation, Explosives, Construction, Dam construction.
Identifiers: *Medeo(USSR).

A dam was constructed by use of explosives at Medeo on the Malaya Almatinka River, USSR. It has a height of approximately 100 m. The explosion was required not only for destruction and breaking up of the edges of the gorge, but also for transferring the crushed rock into the body of the dam from distances as far as 300 m. The weight of a single charge in a separate chamber exceeded 3600 tons, and the total weight of all the charges was close to 10,000 tons. (Knapp-USGS)

PERCUSSIVE WATER JETS FOR RAPID EXCAVATION--FINAL REPORT,
Scientific Associates, Inc., Santa Monica, Calif.
E. B. Nebeker, and S. E. Rodriguez.
Available from NTIS, Springfield, Va 22161 as AD-772 931, Price $3.75 printed copy, $2.25 microfiche. Contract Report for Army Mobility Equipment Research and Development Center, December 1973. 54 p, 13 fig, 41 ref. Army Contract No DAAK02-73-C-0163.

Descriptors: *Jets, *Excavation, *Rock mechanics, *Tunneling, Hydraulics, Unsteady flow.
Identifiers: Rapid excavation.

Percussive water jets were tested for their utility for rock excavation. A percussive jet applies force to the rock as a series of high-frequency impacts, rather than steadily. Percussive impact has various favorable features for rock excavation: increased impact area per unit water volume, repetitive initial-impact waterhammer pressure and high lateral outflow velocity, cyclical stress unloading, and short-duration stressing. Percussive jets can be produced by modulating the jet discharge. Modulated free stream bunching was observed by stroboscopic light; oscilloscope traces of percussive impact were obtained by means of a piezoelectric force gage with high-frequency response. Rock impact test were performed using a 0.06-inch diameter nozzle and 8300 psi discharge pressure on massive specimens of granite, limestone, and sandstone. The experimental percussive jets, modulated at frequencies of 5000 and 2000 cycles/sec, and conventional unmodulated jets were discharged at the rocks under the same conditions in order to compare their effects. In granite, the percussive jets produced substantial fracture cavities whereas the unmodulated jets could at most produce slight roughening of the surface. In limestone, the percussive jets were four or five times as efficient as the unmodulated jets, and in sandstone about twice as efficient. (Knapp-USGS)

THE LENGTH OF RESIDENCE OF JUVENILE FALL CHINOOK SALMON IN SIXES RIVER, OREGON,
Oregon Fish Commission, Port Orford. Div. of Management and Research.
P. E. Reimers.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-74-10202, $3.00 in paper copy; $2.25 in microfiche. Research Reports of the Fish Commission of Oregon, Vol 4, No 2, June 1973. 43 p, 29 fig, 8 tab, 43 ref.

Descriptors: *Chinook salmon, *Oregon, *Aquatic habitats, *Life cycles, Estuaries, Rivers, Streams, Fish reproduction, Fisheries, Fry, Growth rates, Growth stages, Life history studies, Migration.
Identifiers: *Sixes River(OR).

The life history of juvenile fall chinook salmon was studied in Sixes River, a small coastal river of Oregon, by documenting the length of residence of the juveniles throughout the river, exploring several factors influencing their length of residence, and assessing the relative importance of freshwater and estuarine rearing areas for producing returning spawners. Spawning occurred mostly in the tributary streams, primarily in Dry Creek. Most fish spawned from November to January. Fry emerged from the gravel from March to May. Newly emerged fry moved downstream from the spawning areas in large numbers at night. This movement apparently resulted from emergence at night and lack of visual orientation of the fry during the darkness. Downstream movement was reduced during increased light levels. Many juveniles remained in freshwater until early summer. Most then entered the estuary, possible because of high temperature in the main river. A small number of fish continued to reside in the cool spawning tributaries. The population level in the estuary peaked at about 145,000 fish during July and August and then declined to a low level in autumn. The rate of growth of the juveniles was reduced for 3 months during the period of high population abundance. After the population declined in late summer, growth of juveniles again improved. Following the autumn freshets, most fall chinook salmon entered the ocean. A few fish from the tributary populations remained in freshwater through the winter and migrated to the ocean as yearlings the following spring. The type-3 fish, those remaining in freshwater until early summer and then remaining for a period of improved growth in the estuary, represented about 90% of the returning spawners. Based on the return of these type-3 fish, freshwater and estuarine rearing were concluded to be about equally important to fall chinook salmon in Sixes River. (Knapp-USGS)

CARP CULTURE IN SINGAPORE: A CASE STUDY,
Singapore Univ.
T. L. Wah.
J Trop Geogr. 35: p 67-74, 1972. Illus.
Identifiers: *Carp cultures, Mangrove, *Singapore, Swamp.

The freshwater fishers of Singapore at present provide an insignificant proportion of the local production of fresh fish: only 852 tons (4.7%) out of a total of 18,026 tons in 1970. There is little likelihood of an areal expansion of freshwater fisheries on the island because of the shortage of land and the need to put the land, wherever possible, to more productive and more profitable uses than fish culture. However, there are still some areas of swampland in the less accessible and therefore less valuable parts of Singapore which could conceivably be cleared for freshwater fish ponds. A farm is described which is a particularly good example of how mangrove swamps have been converted to profitable use as fish ponds. There could be more commercial carp farms run along the same lines.--Copyright 1973, Biological Abstracts, Inc.

ENERGY--A SPECIAL BIBLIOGRAPHY WITH INDEXES.
National Aeronautics and Space Administration, Washington, D.C.
Available from NTIS, Springfield, Va. 22161 as NASA SP-7042, Price $6.00 printed copy; $2.25 microfiche. Special Report 7042, April 1974. 524 p.

Descriptors: *Bibliographies, *Energy, *Abstracts, Energy conversion, Nuclear energy, Solar radiation, Thermal power, Geothermal studies.

This literature survey of special energy and energy related documents lists 1708 reports, articles, and other documents introduced into the NASA scientific and technical information system between January 1, 1968, and December 31, 1973. Citations from International Aerospace Abstracts (IAA) and Scientific and Technical Aerospace Reports (STAR) are grouped according to the following subject categories: energy systems; solar energy; primary energy sources; secondary energy sources; energy conversion; energy transport, transmission, and distribution; and energy storage. Included are subject, personal author, corporate source, contract, report, and accession indexes. (Knapp-USGS)
W74-11966

ENERGY: A CONTINUING BIBLIOGRAPHY WITH INDEXES.
National Aeronautics and Space Administration, Washington, D.C.
Available from NTIS, Springfield, Va. 22161 as NASA SP-7043(01), Price $4.00 printed copy; $2.25 microfiche. Special Publication 7043(01), May 1974. 68 p.

Descriptors: *Bibliographies, *Energy, *Abstracts, Energy conversion, Nuclear energy, Solar radiation, Thermal power, Geothermal studies.

This is the first issue of a new quarterly publication, Energy: A Continuing Bibliography with Indexes (NASA SP-7043). It lists 232 reports, journal articles, and other documents originally announced between January 1, 1974 and March 31, 1974 in Scientific and Technical Aerospace Reports (STAR) or in International Aerospace Abstracts (IAA). The coverage includes regional, national and international energy systems; research and development on fuels and other sources of energy; energy conversion, transport, transmission, distribution and storage, with special emphasis on use of hydrogen and of solar energy. Also included are methods of locating or using new energy resources. Of special interest is energy for heating, lighting, for powering aircraft, surface vehicles, or other machinery. Five indexes-subject, personal author, corporate source, contract number, and report number are included. The indexes are of the cumulating type throughout the year, with the fourth quarterly publication containing abstracts for the fourth quarter and index references for the four quarterly publications. ARTHROPODS
Effect of Blackfly Larviciding in Some Adirondack Streams,
W74-11489 5C

ARTIC
Measurement of Discharge Under Ice Cover,
W74-11511 7B

ARTIFICIAL PRECIPITATION
Experimental Research in the Artificial Control of Precipitation during the Cold Period of Year on an Experimental Meteorological Range,
W74-11782 3B

ASPERGILLUS NIGER
Uptake of Mercuric Chloride and Methylmercury Chloride from Liquid Media by Aspergillus niger and Penicillium notatum,
W74-11877 5C

ASSAY
Simplified Atomic Absorption Determination of Stable Strontium in Milk and Hay: A Comparison of Methods and Stepwise Procedure,
W74-11652 5A

Environmental Monitoring Report - United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1971.
W74-11659 5B

Environmental Monitoring Report, Period Covering May 1, 1973 Through July 31, 1973 for El Paso Natural Gas Company.
W74-11954 5B

ASSESSMENT
Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

The Present and Future Situation of Nuclear Energy Production and its Associated Industry--Normal Operation, Accident Prevention and Mitigation, Comparative Risk Assessment,
W74-11953 5C

ASSESSMENTS
Damage Assessment of Household Water Quality,
W74-11646 5C

ASTERIAS VULGARIS
Response of Asterias Vulgaris to Chemical Stimuli,
W74-11952 5C

ATLANTIC SALMON
Lethal Response by Atlantic Salmon Parr. to Some Polyoxyethylated Cationic and Nonionic Surfactants,
W74-11481 5C

ATMOSPHERIC PHYSICS
Structure and Modification of Clouds and Fogs,
W74-11745 3B

ATOMIC ABSORPTION SPECTROSCOPY
Atomic Absorption Determination of Elemental Mercury Collected from Ambient Air on Silver Wool,
W74-11705 5A

ATTITUDE SURVEY
Nuclear Power and Public Opinion,
W74-11656 5G

ATTITUDES
A Summary of a Study of Citizen Views and Actions on the Proposed Ames Reservoir,
W74-11596 6B

Public Use and Evaluation of Reclaimed Water,
W74-11878 5D

ATTRACTANTS
Response of Asterias Vulgaris to Chemical Stimuli,
W74-11952 5C

AUSTRALIA
Water-Level Transducers,
W74-11498 7B

Hydraulic Model Study to Determine a Stage-Discharge Relationship,
W74-11531 2E

Developments in the Processing of Hydrological Data in Australia,
W74-11562 7C

Proceedings of the Urban Water Economics Symposium.
W74-11682 6B

Urban Water Supply Catchments: Some Illustrations of Resource Allocation and Conflict Regulation,
W74-11684 6B

Some Aspects of Urban Water Supply in Victoria,
W74-11687 6C

An Opportunity Cost Function for Newcastle's Water,
W74-11689 6C

Water Quality Investigations on Forested Catchments in the Cotter River Valley,
W74-11692 5B

Urban-Rural Conflicts in Urban Water Supply,
W74-11694 6D

Models for Allocation of Water Resources,
W74-11696 6A

A New Direction for Urban Investment and Pricing Decisions,
W74-11697 6B

AUTOMATION
The Colorimetric Front-End Sensors in Automatic Surveillance of Water Quality,
W74-11549 5A

A Computer Automated System for Hydrologic Data Acquisition and Analyses,
W74-11558 7B

AXIAL FLOW PUMPS
Low Energy Mechanical Methods of Reservoir Destratification,
W74-11572 4A

BACKGROUND RADIATION
Environmental Monitoring Report, Period Covering May 1, 1973 Through July 31, 1973 for El Paso Natural Gas Company.
W74-11954 5B

BACKWATER
Problems of Flow Measurement in Large Reservoirs,
W74-11532 7B

BACTERIOLOGY
Effect of Molybdenum Starvation and Tungsten on the Synthesis of Nitrogenase Components in Klebsiella pneumoniae,
W74-11713 5C

BANK STABILITY
Seepage in Mississippi River Banks: Report 1, Analysis of Transient Seepage Using a Viscous-Flow Model and the Finite Difference and Finite Element Methods,
W74-11989 4A

BANK STORAGE
Computer Model for Determining Bank Storage at Hungry Horse Reservoir, Northwestern Montana,
W74-11732 4B

Seepage in Mississippi River Banks: Report 1, Analysis of Transient Seepage Using a Viscous-Flow Model and the Finite Difference and Finite Element Methods,
W74-11989 4A

BARAGA COUNTY (MI)
Groundwater and Geology of Baraga County, Michigan,
W74-11987 4B

BARSTOW (CA)
Feasibility of Digital Water-Quality Modeling Illustrated by Application at Barstow, California,
W74-11750 5B

BASALTS
Deep Self-Burial of Radioactive Wastes by Rock-Melting Capsules,
W74-11664 5E

BASE FLOW
Low-Flow Characteristics of Selected Streams in the Sabine River Basin Downstream from Toledo Bend Reservoir,
W74-11743 2E

BASIC DATA COLLECTION
The North Atlantic Ocean as a Source of Atmospheric N2O,
W74-11900 2K

BASIC DATA COLLECTIONS
Hydrometric Stations in Arid Zones,
W74-11496 7B

Accuracy of Current Meter Measurements,
W74-11502 7B

Hydrologic Data for Little Pond Creek and North Elm Creek, Brazos River Basin, Texas, 1972,
W74-11733 2E

Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1972,
W74-11737 2F

Carbon Monoxide in the South Pacific Ocean,
W74-11904 2K

Availability of Data on Surface-Water Quantity and Quality for the San Francisco Bay Region, California, with a Summary of Beneficial Uses and Implications for Land Use,
W74-11980 7C

BAYESIAN METHODS
A Bayesian Approach to Hydrologic Time Series Modeling,
W74-11456 6A

BAYS
Rapid Coastal Bottom Water Temperature Rises,
W74-11901 2L

BEACH EROSION
Variation in Bluff Recession in Relation to Lake Level Fluctuations Along the High Bluff Illinois Shore,
W74-11974 2J

BEACHES
Sediment Transport Due to Oscillatory Waves,
W74-11731 2L

BEAUFORT SEA
Studies of the Inner Shelf and Coastal Sedimentation Environment of the Beaufort Sea from ERTS-1,
W74-11728 2L

BED LOAD
Gauging Stations on Sediment-Loaded Mountain Rivers,
W74-11522 7B

Flow Measurement of Low-Gradient Streams in Sandy Soils,
W74-11523 7B

A Method for Measuring the Quality of Bedload Transported by Short Flood Waves,
W74-11541 7B

Statistical Parameters of Distribution of Granulation Indicating Suspended Sediment and Bed Sediment,
W74-11542 2J

Bedload Measurement by Means of Bottom Plates and Bedload Samplers with Hydrophone Attachments,
W74-11543 7B

BEHAVIOR
Lethality and Behavioral Symptoms Produced by Some Organophosphorous Compounds in the Snail (Helix Aspersa),
W74-11483 5C

BELTSVILLE (MD)
Sludge Disposal Studies at Beltsville,
W74-11841 5D

BENEFIT COST ANALYSIS
Models for Allocation of Water Resources,
W74-11696 6A

BENTHIC FLORA
Alkanes and Alkenes in Marine Benthic Algae,
W74-11951 5C

BIBLIOGRAPHIES
A Selected Annotated Bibliography on the Analysis of Water Resource Systems, Fifth Volume,
W74-11574 6A

Selected Irrigation Return Flow Quality Abstracts 1972-1973, Third Annual Issue.
W74-11576 5G

A Survey of Papers on Ecosystems Analysis from 1947-1971 in the Journal 'Ecology',
W74-11668 5B

Environmental Research Publications, January 1971-July 1973.
W74-11746 5G

Polluted Groundwater: A Review of the Significant Literature,
W74-11800 5B

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-15.
W74-11809 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-14.
W74-11810 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-13.
W74-11811 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-12.
W74-11812 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-11.
W74-11813 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-10.
W74-11814 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-9.
W74-11815 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-8.
W74-11816 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-7.
W74-11817 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-6.
W74-11818 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-5.
W74-11819 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-4.
W74-11820 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-3.
W74-11821 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-2.
W74-11822 8G

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-1.
W74-11823 3A

Energy--A Special Bibliography with Indexes.
W74-11966 10B

Energy: A Continuing Bibliography with Indexes.
W74-11967 10B

A Bibliography on Ocean Waste Disposal.
W74-11985 5E

BIG BEAR LAKE (CALIF)
A Water-Quality Reconnaissance of Big Bear Lake, San Bernardino County, California, 1972-73,
W74-11753 5B

BIOASSAY
Whole-Body and Hair Retention of Cadmium in Mice, Including an Autoradiographic Study on Organ Distribution,
W74-11718 5C

Trail-Marking and Alarm Pheromones of Some Ants of the Genus Atta,
W74-11802 5A

BIOCHEMICAL OXYGEN DEMAND
Determination of the BOD5 in Running Waters by Means of Biological Water Analysis,
W74-11546 5A

Biological Treatability of Landfill Leachate,
W74-11857 5D

BIODEGRADATION
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W74-11725 5B

Biodegradation of Oil in Sea Water for Naval Pollution Control,
W74-11976 5G

Microbial Degradation of DDT,
W74-11992 5B

BIOINDICATORS
Analysis of Coprostanol, an Indicator of Fecal Contamination,
W74-11794 5A

Oil Pollution Monitoring in the Lagoon of Venice Using the Mussel Mytilus Galloprovincialis,
W74-11948 5C

BIOLOGICAL COMMUNITIES
Comparative Ecosystems Studies,
W74-11585 6G

Transfer of Mercury and Cadmium from Terrestrial to Aquatic Ecosystems,
W74-11703 5B

BIOLOGICAL TREATMENT
Further Purification of Biologically Treated Waste Water Treatment Plant Effluents by Means of Microstrainers (Weiterreinigung Biologisch Behandelter Klaeranlagenablaeufe Mit Hilfe Von Microstrainern),
W74-11856 5D

Biological Treatability of Landfill Leachate,
W74-11857 5D

Brandon Sewage Plant Features Novel Clarifier.
W74-11861 5D

Treatment of Waste Water from the Production of Polyhydric Organics.
W74-11926 5D

Phosphorus Removal by an Activated Sludge Plant.
W74-11927 5D

Phosphorus Removal and Disposal from Municipal Waste Water.
W74-11928 5D

BIOMASS
Ecological Impact of the In-line Arrangement of Two Reservoirs and a Metropolitan Area,
W74-11571 5C

BLACK SEA
Aspects of the Distribution and Trace Element Composition of Suspended Matter in the Black Sea,
W74-11709 5B

BLACKFLY
Effect of Blackfly Larviciding in Some Adirondack Streams,
W74-11489 5C

BLOOD SERUM OSMOLALITY
Effects of Copper and Cadmium on Osmoregulation and Oxygen Consumption in Two Species of Estuarine Crabs,
W74-11491 5C

BLUEFISH
Mercury in Striped Bass and Bluefish,
W74-11488 5A

BOATING
The Effect of Boat Waves on the Sedimentary Processes of a New England Tidal Flat,
W74-11973 2J

BODIES OF WATER
How Much Metal is There in Our Waters,
W74-11918 5B

BOONE COUNTY (IL)
Public Groundwater Supplies in Boone County,
W74-11882 4B

BOTTOM SEDIMENTS
Report on a New Underway Sediment Sampler,
W74-11726 2J

BRACKISH WATER
Summary of Desalination Plant Brine Disposal Methods for Inland Locations, Final Report, February 1971.
W74-11808 3A

BRAZOS COUNTY (TX)
Groundwater Resources of Brazos and Burleson Counties, Texas,
W74-11994 4B

BRAZOS RIVER BASIN (TX)
Hydrologic Data for Little Pond Creek and North Elm Creek, Brazos River Basin, Texas, 1972,
W74-11733 2E

BREAKWATERS
Wave Transmission through Porous Structures,
W74-11474 8B

Quadratic Loss and Scattering of Long Waves,
W74-11478 8B

BRINE DISPOSAL
Summary of Desalination Plant Brine Disposal Methods for Inland Locations, Final Report, February 1971.
W74-11808 3A

BRINES
Preliminary Evaluation of Fluidic Techniques for Flow Modulation in the Multi-Stage Flash Distillation Process,
W74-11827 3A

VTE Evaporators for Geothermal Brines,
W74-11829 3A

Treatment of Waste Water from the Production of Polyhydric Organics.
W74-11926 5D

BROOK TROUT
Effect of Rate and Duration of Feeding DDT on the Reproduction of Salmonid Fishes Reared and Held Under Controlled Conditions,
W74-11933 5C

BROOKSTON SOILS
Soil-Water Regimes in Brookston and Crosby Soils,
W74-11899 2G

BROWN COUNTY (IL)
Public Groundwater Supplies in Brown County,
W74-11881 4B

BROWN TROUT
Effect of Rate and Duration of Feeding DDT on the Reproduction of Salmonid Fishes Reared and Held Under Controlled Conditions,
W74-11933 5C

BRUSH CONTROL
Assessment of the Ecological Consequences of Herbicide Use Along Transmission Line Rights-of-Way and Recommendation for Such Use,
W74-11977 5C

BUBBLES
The Air-Bubble Method of Flow Measurement and Its Application,
W74-11525 7B

BURDEKIN RIVER (AUSTRALIA)
Hydraulic Model Study to Determine a Stage-Discharge Relationship,
W74-11531 2E

BURLESON COUNTY (TX)
Groundwater Resources of Brazos and Burleson Counties, Texas,
W74-11994 4B

BURNING
Evaluation of a Field-Type Incineration for Human Waste, (Theater of Operation Sewage Treatment Systems),
W74-11785 5D

BYPRODUCTS
Protein Production from Acid Whey Via Fermentation,
W74-11795 5D

Merchandising Heat-Dried Sludge,
W74-11842 5D

CADDISFILIES
Ecological Impact of the In-line Arrangement of Two Reservoirs and a Metropolitan Area,
W74-11571 5C

CADMIUM
Effects of Copper and Cadmium on Osmoregulation and Oxygen Consumption in Two Species of Estuarine Crabs,
W74-11491 5C

Transfer of Mercury and Cadmium from Terrestrial to Aquatic Ecosystems,
W74-11703 5B

Aerosols of Lead, Nickel, and Cadmium,
W74-11716 5A

Whole-Body and Hair Retention of Cadmium in Mice, Including an Autoradiographic Study on Organ Distribution,
W74-11718 5C

Electron Microscopic Study of Cadmium Nephrotoxicity in the Rat,
W74-11719 5C

New Global Watch for Pollution Effects.
W74-11866 5A

Polarographic Determination of 8-Hydroxyquinolinates After Extraction with Naphthalene. Trace Analysis of Cadmium and Lead,
W74-11876 5A

Cadmium - A Trace Element of Concern in Mining and Manufacturing,
W74-11919 5B

CALCIUM
Consecutive Titration of Calcium and Magnesium in Ethanol-Water Mixture,
W74-11721 2K

CALIBRATIONS
Accuracy of Current Meter Measurements,
W74-11502 7B

Calibration of Current Meters in a Submerged Jet,
W74-11503 7B

The Magnitude of Errors at Flow Measurement Stations,
W74-11504 7B

Problems in the Design of Measuring Structures,
W74-11507 7B

Laboratory Calibration of the Walnut Gulch Supercritical Flow-Measuring Flume,
W74-11519 7B

Accuracy and Rationalization of River Discharge Measurements,
W74-11527 7B

CALIFORNIA
Water Supplies and Cost in Relation to Farm Resource Use Decisions and Profits on Sacramento Valley Farms,
W74-11568 3F

Development Program and Test Instrumentation for VTE/MSF Module Plant, Fountain Valley, California.
W74-11635 3A

Analysis of Existing Data from the San Diego Test Facility, Phase II Final Report,
W74-11638 3A

Environmental Levels of Radioactivity in the Vicinity of the Lawrence Livermore Laboratory - 1973 Annual Report,
W74-11660 5B

Feasibility of Digital Water-Quality Modeling Illustrated by Application at Barstow, California,
W74-11750 5B

A Water-Quality Reconnaissance of Big Bear Lake, San Bernardino County, California, 1972-73,
W74-11753 5B

Erosion Processes, Fluvial Sediment Transport and Reservoir Sedimentation in a Part of the Newell and Zayante Creek Basins, Santa Cruz County, California,
W74-11758 2J

Streamflow, Sediment, and Turbidity in the Mad River Basin, Humboldt and Trinity Counties, California,
W74-11770 2E

Project Skywater.
W74-11778 3B

Annual Report - San Diego Test Facility, January 1, 1971 - February 15, 1972.
W74-11828 3A

VTE Evaporators for Geothermal Brines,
W74-11829 3A

Public Use and Evaluation of Reclaimed Water,
W74-11878 5D

Availability of Data on Surface-Water Quantity and Quality for the San Francisco Bay Region, California, with a Summary of Beneficial Uses and Implications for Land Use,
W74-11980 7C

CAMP A P HILL (VA)
Prototype Reverse Osmosis Water Purification Unit,
W74-11988 3A

CANADA
The Use of Radar in Urban Hydrology,
W74-11468 2E

Vortex Clarifier Achieves Fast Separations.
W74-11859 5D

Gamma Radiation as an Effective Disinfectant,
W74-11860 5D

Brandon Sewage Plant Features Novel Clarifier.
W74-11861 5D

Some Characteristics of Nearshore Currents Along the North Shore of Lake Ontario,
W74-11898 2H

Effects of Hydroelectric Development in Western Canada on Aquatic Ecosystems,
W74-11944 5C

CANAL ZONE
Evaporimetry in the Canal Zone: Part II, Comparison of Various Types of Evaporimeters on an Hourly Basis,
W74-11740 2D

CANALS
Use of Depth Floats in Drainage Canals with Aquatic Weed,
W74-11510 7B

Final Environmental Statement Related to the Proposed Summit Power Station Units 1 and 2 - Delmarva Power and Light Company.
W74-11675 5B

Time of Travel and Dye Dosage for an Irrigation Canal System Near Duchesne, Utah,
W74-11970 2E

CANCER IRRORATUS
Effects of Copper and Cadmium on Osmoregulation and Oxygen Consumption in Two Species of Estuarine Crabs,
W74-11491 5C

CANNERIES
Demonstration of a Full-Scale Waste Treatment System for a Cannery,
W74-11925 5D

CANYON FERRY RESERVOIR (MT)
An Investigation into the Extent and Cause of Eutrophication in Canyon Ferry Reservoir, Montana,
W74-11573 5C

CAPE COD (MA)
Alkanes and Alkenes in Marine Benthic Algae,
W74-11951 5C

CAPILLARY ACTION
Effect of Surface Wettability on Capillary Movement of Water in Soil (Vliyaniye smachivayemosti poverkhnosti na kapillyarnoye peredvizheniye vlagi v pochve),
W74-11452 2G

CAPILLARY WATER
Effect of Surface Wettability on Capillary Movement of Water in Soil (Vliyaniye smachivayemosti poverkhnosti na kapillyarnoye peredvizheniye vlagi v pochve),
W74-11452 2G

CARBAMATE PESTICIDES
Lethality and Behavioral Symptoms Produced by Some Organophosphorous Compounds in the Snail (Helix Aspersa),
W74-11483 5C

CARBON MONOXIDE
Carbon Monoxide in the South Pacific Ocean,
W74-11904 2K

CARCINUS MAENAS
Effects of Copper and Cadmium on Osmoregulation and Oxygen Consumption in Two Species of Estuarine Crabs,
W74-11491 5C

CAREX BOHEMICA
The Distribution of Carex bohemica Schreb. in the Central Belt of the European Part of the USSR, (In Russian),
W74-11873 2H

CARP
High Zinc Concentration in Common Carp Viscera,
W74-11946 5C

CARP CULTURES
Carp Culture in Singapore: A Case Study,
W74-11945 8I

CAVES
Detection of Subsurface Cavities,
W74-11756 4B

CESIUM
Ratio of CS-137 -- SR-90 in Ocean and Sea Water,
W74-11959 5B

CHANNEL CATFISH
Paunch Manure as a Feed Supplement in Channel Catfish Farming,
W74-11796 5C

CHANNEL MORPHOLOGY
Estimating Flood Discharges in Nevada Using Channel-Geometry Measurements,
W74-11742 4A

CHANNELS
Hydraulics of Main Channel-Floodplain Flows,
W74-11462 8B

Free Surface Slopes at Controls in Channel Flow,
W74-11888 8B

CHELATION
Development of Sea Water Membranes, Part I,
W74-11643 3A

Biochemical Responses to Provocative Chelation by Edetate Disodium Calcium,
W74-11723 5C

CHEMICAL POTENTIAL
Cost and Feasibility of Stimulating Tight Gas Reservoirs with Chemical Explosives,
W74-11663 8H

CHEMICAL PRECIPITATION
Color Removal and Sludge Disposal Process for Kraft Mill Effluents,
W74-11803 5D

Selective Separation and Concentration of Silver Via Precipitation Chromatography,
W74-11911 5A

CHEMICAL STIMULI
Response of Asterias Vulgaris to Chemical Stimuli,
W74-11952 5C

CHEMICAL WASTES
Recovery of Heavy Metals from Waste Acid (Haisan Kara No Jukinzoku No Kaishu),
W74-11879 5D

CHESAPEAKE BAY
A Technique for Interpretation of Multispectral Remote Sensor Data,
W74-11773 7C

CHESAPEAKE CANAL
Final Environmental Statement Related to the Proposed Summit Power Station Units 1 and 2 - Delmarva Power and Light Company.
W74-11675 5B

CHICAGO (ILL)
Methods of Liquid Fertilizer Application,
W74-11839 5D

Flood Plain Management in Metropolitan Chicago,
W74-11867 6F

CHINOOK SALMON
The Length of Residence of Juvenile Fall Chinook Salmon in Sixes River, Oregon,
W74-11788 8I

CHLORINATED HYDROCARBON PESTICIDES
Observations on the Distribution of Chlorinated Hydrocarbons in Atlantic Ocean Organisms,
W74-11484 5B

Pesticide Movement from Cropland into Lake Erie,
W74-11922 5B

CHLORINATION
Gamma Radiation as an Effective Disinfectant,
W74-11860 5D

CHLORINE
Chlorination Experiments at the John E. Amos Plant of the Appalachian Power Company: April 9-10, 1973,
W74-11676 5A

CHOLINESTERASE
Lethality and Behavioral Symptoms Produced by Some Organophosphorous Compounds in the Snail (Helix Aspersa),
W74-11483 5C

CHOLINESTERASES
Short-Term Effects of Organophosphate Pesticides on Cholinesterases of Estuarine Fishes and Pink Shrimp,
W74-11486 5C

CHROMATOGRAPHY
Trail-Marking and Alarm Pheromones of Some Ants of the Genus Atta,
W74-11802 5A

Selective Separation and Concentration of Silver Via Precipitation Chromatography,
W74-11911 5A

CHROMIUM
Characterization and Treatability of Chrome Tanning Waste,
W74-11707 5D

CIRCULAR HYDRAULIC JUMP
Circular Jumps,

W74-11639 3A

DESALINATION PLANTS

Comparison Study of a 2.5 MGD Vertical Tube Evaporator Upflow Versus Downflow,
W74-11628 3A

Evaluation of 75,000 GPD Continuous Ion Exchange Sea Water Desulfating Pilot Plant,
W74-11629 3A

Conceptual Design and Cost Estimate of a Vapor Compression VTE/MSF Desalting Plant,
W74-11630 3A

Operation of the 16-Stage MSF Pilot Plant--1969-1970,
W74-11631 3A

Evaluation of the Capabilities of the Vertical Tube Evaporator and the Multistage Flash Distillation Desalination Processes.
W74-11632 3A

Fourth Report on Horizontal-Tube Multiple-Effect (HTME) Process Pilot Plant Test Program,
W74-11633 3A

Fifth Report on Horizontal-Tube Multiple Effect (HTME) Process Pilot Plant Test Program,
W74-11634 3A

Development Program and Test Instrumentation for VTE/MSF Module Plant, Fountain Valley, California.
W74-11635 3A

Conceptual Design and Cost Estimate 2.5 MGD Direct Contact Condensation Multistage Flash Desalination Plant,
W74-11637 3A

Analysis of Existing Data from the San Diego Test Facility, Phase II Final Report,
W74-11638 3A

Annual Report - Vertical Tube Evaporator Multistage Flash Test Bed Plant, Freeport, Texas, March 19, 1971 to March 31, 1972.
W74-11807 3A

Summary of Desalination Plant Brine Disposal Methods for Inland Locations, Final Report, February 1971.
W74-11808 3A

Final Report Study of the Application of Aluminum as a Principal Material of Construction in a 50 MGD Multistage Flash Distillation System.
W74-11824 3A

Preliminary Evaluation of Fluidic Techniques for Flow Modulation in the Multi-Stage Flash Distillation Process,
W74-11827 3A

200 MGD Desalting Plant Conceptual Study, Advanced Thin Film Distillation Process and Test Module Design.
W74-11830 3A

MSF Distillation Plant (Module), Vertical Tube Evaporation (VTEX), Semi-Annual Report, June 1, 1970, through December 31, 1970,
W74-11831 3A

Management, Operation and Maintenance of Brackish Water Test Facility, Roswell, New Mexico, July 1970 - April 1972,
W74-11832 3A

DESALINATION PROCESSES

Field Testing of Improved Ion Exchange Techniques,
W74-11826 3A

VTE Evaporators for Geothermal Brines,
W74-11829 3A

DESIGN

Comparison Study of a 2.5 MGD Vertical Tube Evaporator Upflow Versus Downflow,
W74-11628 3A

Conceptual Design and Cost Estimate 2.5 MGD Direct Contact Condensation Multistage Flash Desalination Plant,
W74-11637 3A

Least Cost Design of Branched Pipe Network System,
W74-11647 8B

Spillway Crest Design,
W74-11757 8B

Final Report Study of the Application of Aluminum as a Principal Material of Construction in a 50 MGD Multistage Flash Distillation System.
W74-11824 3A

VTE Evaporators for Geothermal Brines,
W74-11829 3A

200 MGD Desalting Plant Conceptual Study, Advanced Thin Film Distillation Process and Test Module Design.
W74-11830 3A

MSF Distillation Plant (Module), Vertical Tube Evaporation (VTEX), Semi-Annual Report, June 1, 1970, through December 31, 1970,
W74-11831 3A

Nationwide Experiences in Land Treatment,
W74-11851 5D

DESIGN CRITERIA

Evaluation of the Capabilities of the Vertical Tube Evaporator and the Multistage Flash Distillation Desalination Processes.
W74-11632 3A

Fifth Report on Horizontal-Tube Multiple Effect (HTME) Process Pilot Plant Test Program,
W74-11634 3A

City of Manchester--Main Drainage Work 6,
W74-11868 4A

DESIGN DATA

Evaluation of the Capabilities of the Vertical Tube Evaporator and the Multistage Flash Distillation Desalination Processes.
W74-11632 3A

DESIGN FLOOD

Methods of Flood Flow Determination in Sparse Data Regions,
W74-11458 4A

DESIGN FLOW

Spillway Crest Design,

DISPERSION
Movement and Dispersion of Soluble Materials in Salem Creek, Muddy Creek and Yadkin River Between Winston-Salem and Salisbury, North Carolina,
W74-11749 5B

A Model of Circulation and Dispersion in Pearl Harbor,
W74-11769 5B

Do-Sag in Oscillating Flow,
W74-11897 5B

Generalization of Stream Travel Rates and Dispersion Characteristics from Time-of-Travel Measurements,
W74-11971 2E

Investigation of Diffusion in Open-Channel Flows,
W74-11972 2E

DISSOLVED OXYGEN
Practical Experience with Devices to Measure O2 Content, Turbidity, Solid Matter Content and Electrical Conductivity Used for Monitoring Water Quality in Rivers,
W74-11548 5A

Activated Sludge Process Using Pure Oxygen,
W74-11799 5D

Effects of Water Reuse on Rainbow Trout in Hatcheries,
W74-11940 5C

DISTILLATION
An Investigation of the Variables Affecting Steam Condensation on the Outside of a Horizontal Tube Bundle,
W74-11639 3A

Surface Properties of Water,
W74-11640 2K

DISTILLATION PLANTS
Annual Report - San Diego Test Facility, January 1, 1971 - February 15, 1972.
W74-11828 3A

DISTRIBUTION
Method for Indirectly Defining Optimum Temperatures of Inhabitancy for Marine Cold-Blooded Animals,
W74-11487 5C

DIVERSITY INDICES
A Diversity Indices Computer Program for Use in Aquatic Systems Evaluation,
W74-11463 7C

DOCUMENTATION
Polluted Groundwater: A Review of the Significant Literature,
W74-11800 5B

NSF-RANN Trace Contaminants Directory, 1973,
W74-11961 5A

DOMESTIC WATER
Economic Damages to Household Items from Water Supply Use,
W74-11930 5G

DRAG
Viscous Drag Reduction in Developing Pipe Flow,
W74-11755 8B

Drag Reduction by Polymer Addition,
W74-11780 8B

DRAG REDUCTION
Viscous Drag Reduction in Developing Pipe Flow,
W74-11755 8B

Drag Reduction by Polymer Addition,
W74-11780 8B

DRAINAGE AREA
City of Manchester--Main Drainage Work 6,
W74-11868 4A

DRAWDOWN
Digital Recording of Water Levels with the Aid of Acoustics and its Application to Hydrological Pumping Tests,
W74-11495 7B

DURATION CURVES
A Contribution to Statistical Depth-Duration-Frequency Analysis,
W74-11469 2B

DYE DISPERSION
Techniques for Measurement of Discharge by Dye Dilution,
W74-11513 7B

Stream Hydrographs by Fluorescent Tracers,
W74-11514 7B

DYE RELEASES
Movement and Dispersion of Soluble Materials in Salem Creek, Muddy Creek and Yadkin River Between Winston-Salem and Salisbury, North Carolina,
W74-11749 5B

EARTH DAMS
Directed Explosions--Experience at Medeo,
W74-11768 8H

EARTHWATCH
New Global Watch for Pollution Effects.
W74-11866 5A

ECOLOGICAL DISTRIBUTION
Ecological Impact of the In-line Arrangement of Two Reservoirs and a Metropolitan Area,
W74-11571 5C

Transfer of Mercury and Cadmium from Terrestrial to Aquatic Ecosystems,
W74-11703 5B

ECOLOGICAL IMPACT
Survey of Economic-Ecologic Impacts of Small Watershed Development,
W74-11680 6B

ECOLOGY
Current Problems in the Radioecology of Soils and Plants,
W74-11666 5B

Dynamics of Playa Lakes in the Texas High Plains,
W74-11774 7B

Problems of Radioecology in Connection with the Development of Nuclear Power,
W74-11958 5B

Assessment of the Ecological Consequences of Herbicide Use Along Transmission Line Rights-of-Way and Recommendation for Such Use,
W74-11977 5C

ECONOMIC EFFICIENCY
A Method for Analysis of Residential Water Demand and Its Relation to Management,
W74-11695 6B

The Economic Damages of Air Pollution,
W74-11798 5A

ECONOMIC IMPACT
Economic Damages to Household Items from Water Supply Use,
W74-11930 5G

ECONOMIC JUSTIFICATION
Water Control on Agricultural Land,
W74-11612 6B

Project Benefit-Cost Analysis,
W74-11626 6B

The Economics of Data Collection Systems,
W74-11693 6C

ECONOMICS
Damage Assessment of Household Water Quality,
W74-11646 5C

Proceedings of the Urban Water Economics Symposium.
W74-11682 6B

A Multidisciplinary Policy Decision Model for Water Pollution,
W74-11686 5G

ECOSYSTEMS
Comparative Ecosystems Studies,
W74-11585 6G

A Survey of Papers on Ecosystems Analysis from 1947-1971 in the Journal 'Ecology',
W74-11668 5B

Ecological-Environmental Assessments Related to the Federal Repository,
W74-11672 5B

Transfer of Mercury and Cadmium from Terrestrial to Aquatic Ecosystems,
W74-11703 5B

Effects of Hydroelectric Development in Western Canada on Aquatic Ecosystems,
W74-11944 5C

Problems of Radioecology in Connection with the Development of Nuclear Power,
W74-11958 5B

EDGAR COUNTY (IL)
Public Groundwater Supplies in Edgar County,
W74-11886 4B

EDWARDS PLATEAU (TEX)
Measurement of Discharge as Inflow Into Leaky Reservoirs,
W74-11529 7B

EFFECTS
A View of the Valley's People,
W74-11592 6B

EFFLUENTS
Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

Modeling Radiation Exposure to Populations from Radioactivity Released to the Environment,
W74-11655 5B

Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1972.
W74-11658 5B

Control and Treatment of Radioactive Liquid Waste Effluents at the Savannah River Plant,
W74-11661 5D

Municipal Effluent Characteristics,
W74-11847 5B

Environmental Control in Nuclear Fuel Reprocessing,
W74-11955 5B

Environmental Monitoring at the Pacific Northwest Laboratory by Battelle-Northwest,
W74-11956 5B

Assessing Potential Radiological Impacts to Aquatic Biota in Response to the National Environmental Policy Act (NEPA) of 1969,
W74-11957 5C

EL NINO
Eastern Intensification of Ocean Spin-Down: Application to El Nino,
W74-11894 2E

ELECTRICAL CONDUCTANCE
Measurement and Significance of Electrical Conductivity in Small Mountain Streams,
W74-11547 7B

ELECTRICAL PROPERTIES
Molecular Mechanisms of Conduction and Polarization in Water Vapor, Liquid Water, and Ice,
W74-11744 1B

ELECTRICAL STUDIES
Detection of Subsurface Cavities,
W74-11756 4B

Application of Surface Geophysics to Groundwater Investigations,
W74-11996 4B

ELECTROCHEMISTRY
Studies of Oxygen Reduction at a Rotating Disk Electrode,
W74-11641 3A

ELECTRODES
Studies of Oxygen Reduction at a Rotating Disk Electrode,
W74-11641 3A

Ammonium Ion Specific Electrode,
W74-11984 2K

ELECTROLYSIS
Sewage Electrolysis,
W74-11871 5D

ELECTRON MICROSCOPY
Electron Microscopic Study of Cadmium Nephrotoxicity in the Rat,
W74-11719 5C

ELMIRA (NY)
A Method for Integrating Surface and Ground Water Use in Humid Regions,
W74-11964 5F

ENERGY
Energy--A Special Bibliography with Indexes.
W74-11966 10B

Energy: A Continuing Bibliography with Indexes.
W74-11967 10B

ENGINEERING GEOLOGY
Hydrogeology of the USSR. Volume 4: Voronezh, Kursk, Belgorod, Bryansk, Orlov, Lipetsk, and Tambov Oblasts (Gidrogeologiya SSSR. Tom IV. Voronezhskaya, Kurskaya, Belgorodskaya, Bryanskaya, Orlovskaya, Lipetskaya, Tambovskaya Oblasti).
W74-11453 4B

Hydrogeology of the USSR. Volume 17: Kemerovo Oblast and Altay Territory (Gidrogeologiya SSSR. Tom XVII. Kemerovskaya oblast' i Altayskiy kray).
W74-11454 4B

Hydrogeology of the USSR. Volume 26. Soviet North East (Gidrogeologiya SSSR. Tom XXVI. Severo-Vostok).
W74-11455 4B

ENVIRONMENT
Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1972.
W74-11658 5B

Environmental Monitoring Report - United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1971.
W74-11659 5B

Environmental Levels of Radioactivity in the Vicinity of the Lawrence Livermore Laboratory - 1973 Annual Report,
W74-11660 5B

Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1973.
W74-11667 5B

Final Environmental Statement Related to the Proposed Summit Power Station Units 1 and 2 - Delmarva Power and Light Company.
W74-11675 5B

Environmental Research Publications, January 1971-July 1973.
W74-11746 5G

ENVIRONMENTAL CONTROL
Environmental Control in Nuclear Fuel Reprocessing,
W74-11955 5B

ENVIRONMENTAL EFFECTS
Environmental Statements and Water Resource Planning in North Carolina,
W74-11460 6G

Ames Reservoir Environmental Study. Appendix 1 - Vol. 2. Natural and Archaeological Resources of the Reservoir Site and Stream System,
W74-11579 6G

Vegetation, Timber Resources and Forest Inventory,
W74-11581 6G

Limnological and Fisheries Aspects of the River and the Proposed Reservoir,
W74-11582 6B

Some Estimated Impacts of the Proposed Ames Reservoir Upon Wildlife,
W74-11583 6B

Comparative Ecosystems Studies,
W74-11585 6G

Broader Evaluation Considerations,
W74-11627 6B

Current Problems in the Radioecology of Soils and Plants,
W74-11666 5B

Ecological-Environmental Assessments Related to the Federal Repository,
W74-11672 5B

Survey of Economic-Ecologic Impacts of Small Watershed Development,
W74-11680 6B

Biologically Allowable Thermal Pollution Limits, Part I and Part II,
W74-11921 5C

Problems of Radioecology in Connection with the Development of Nuclear Power,
W74-11958 5B

Assessment of the Ecological Consequences of Herbicide Use Along Transmission Line Rights-of-Way and Recommendation for Such Use,
W74-11977 5C

ENVIRONMENTAL ENGINEERING
Damage Assessment of Household Water Quality,
W74-11646 5C

Least Cost Design of Branched Pipe Network System,
W74-11647 8B

ENVIRONMENTAL IMPACT STATEMENTS
Environmental Statements and Water Resource Planning in North Carolina,
W74-11460 6G

ENVIRONMENTAL PROTECTION AGENCY
Environmental Research Publications, January 1971-July 1973.
W74-11746 5G

EQUATIONS
On a Possible Extension of Darcy's Law,
W74-11472 2F

EQUIPMENT
Equipment for Incorporating Sewage Sludge and Animal Manures Into the Soil,
W74-11840 5D

Further Purification of Biologically Treated Waste Water Treatment Plant Effluents by Means of Microstrainers (Weiterreinigung Biologisch Behandelter Klaeranlagenablaeufe Mit Hilfe Von Microstrainern),
W74-11856 5D

EROSION
Studies of the Inner Shelf and Coastal Sedimentation Environment of the Beaufort Sea from ERTS-1,
W74-11728 2L

Erosion Processes, Fluvial Sediment Transport and Reservoir Sedimentation in a Part of the Newell and Zayante Creek Basins, Santa Cruz County, California,
W74-11758 2J

The Effect of Boat Waves on the Sedimentary Processes of a New England Tidal Flat,
W74-11973 2J

Variation in Bluff Recession in Relation to Lake Level Fluctuations Along the High Bluff Illinois Shore,
W74-11974 2J

EROSION CONTROL
Joint Construction Sediment Control Project,
W74-11923 4D

ERTS
Ice Development on Lake Champlain,
W74-11772 2H

A Technique for Interpretation of Multispectral Remote Sensor Data,
W74-11773 7C

Dynamics of Playa Lakes in the Texas High Plains,
W74-11774 7B

ESTIMATED COSTS
A Review of Cost Estimates for Proposed and Alternative Designs, Ames Reservoir, Skunk River, Iowa.
W74-11625 6B

ESTUARIES
Oregon's Estuaries: Description and Information Sources for Oregon's Estuaries,
W74-11575 2L

Mercury Concentrations in Fish, Plankton, and Water from Three Western Atlantic Estuaries,
W74-11715 5A

The Estuary and Industrial Wastes: Power Plants,
W74-11869 5D

Sediment and Waste Deposition in New York Harbor,
W74-11874 5B

The Effect of Boat Waves on the Sedimentary Processes of a New England Tidal Flat,
W74-11973 2J

ESTUARINE ENVIRONMENT
Population, Resources, and Pollution, and Their Impact on the Hudson Estuary,
W74-11870 5B

EUTROPHICATION
Long-Term Changes in the Plankton of Eutrophic Mikolajskie Lake as an Effect of Accelerated Eutrophication,
W74-11482 5C

An Investigation into the Extent and Cause of Eutrophication in Canyon Ferry Reservoir, Montana,
W74-11573 5C

EVALUATION
Evaluation of Water Resources Development Projects: The State-Of-The-Art and Emerging Directives,
W74-11587 6B

Alternative Taxonomical Constructs,
W74-11588 6B

Parameter Values for Benefit-Cost Analysis,
W74-11589 6B

Indirect Economic Effects,
W74-11590 6B

Ames Reservoir Environmental Study. Appendix 6. Detailed Economic Review and Project Evaluation.
W74-11623 6B

Project Impact Evaluation,
W74-11624 6B

Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

Survey of Economic-Ecologic Impacts of Small Watershed Development,
W74-11680 6B

A Computer Model For Evaluating Community Phosphorus Removal Strategies,
W74-11931 5D

EVAPORATION
The Effect of Heated Water on the Temperature and Evaporation of Hyco Lake, North Carolina, 1966-72,
W74-11751 5C

Evaporation Losses from Containers of Hellmann Precipitation Gauges,
W74-11909 2B

EVAPORATORS
Comparison Study of a 2.5 MGD Vertical Tube Evaporator Upflow Versus Downflow,
W74-11628 3A

Fourth Report on Horizontal-Tube Multiple-Effect (HTME) Process Pilot Plant Test Program,
W74-11633 3A

Fifth Report on Horizontal-Tube Multiple Effect (HTME) Process Pilot Plant Test Program,
W74-11634 3A

Development Program and Test Instrumentation for VTE/MSF Module Plant, Fountain Valley, California.
W74-11635 3A

Annual Report - Vertical Tube Evaporator Multistage Flash Test Bed Plant, Freeport, Texas, March 19, 1971 to March 31, 1972.
W74-11807 3A

VTE Evaporators for Geothermal Brines,
W74-11829 3A

200 MGD Desalting Plant Conceptual Study, Advanced Thin Film Distillation Process and Test Module Design.
W74-11830 3A

EVAPORIMETERS
Evaporimetry in the Canal Zone: Part II, Comparison of Various Types of Evaporimeters on an Hourly Basis,
W74-11740 2D

EXCAVATION
Percussive Water Jets for Rapid Excavation--Final Report,
W74-11997 8H

EXPERIMENTAL OPEN-CHANNEL FLUME
Hypolimnetic Flow Regimes in Lakes and Impoundments,
W74-11578 8B

EXPLORATION
Geochemical Methods in Geothermal Exploration,
W74-11786 2K

EXPLOSIONS
Cost and Feasibility of Stimulating Tight Gas Reservoirs with Chemical Explosives,
W74-11663 8H

Directed Explosions--Experience at Medeo,
W74-11768 8H

FARM LAGOONS
Anaerobic-Aerobic Lagoon Treatment of Dairy Manure Wastes,
W74-11804 5D

FARM MANAGEMENT
Water Supplies and Cost in Relation to Farm Resource Use Decisions and Profits on Sacramento Valley Farms,
W74-11568 3F

Water Quality Implications of Cropland Nutrients,
W74-11607 6G

Some Constraints of Spreading Sludge on Cropland,
W74-11838 5D

FARM WASTES
Water Quality Implications of Livestock Production,
W74-11609 6B

FARM WASTES

A Waste Treatment System for Confined Hog Raising Operations,
W74-11792 5D

Paunch Manure as a Feed Supplement in Channel Catfish Farming,
W74-11796 5C

Equipment for Incorporating Sewage Sludge and Animal Manures Into the Soil,
W74-11840 5D

FEDERAL PROJECT POLICY
Evaluation of Water Resources Development Projects: The State-Of-The-Art and Emerging Directives,
W74-11587 6B

EPA Viewpoint on Land Application of Liquid Effluents,
W74-11844 5D

FERMENTATION
Protein Production from Acid Whey Via Fermentation,
W74-11795 5D

FERTILIZERS
Selected Irrigation Return Flow Quality Abstracts 1972-1973, Third Annual Issue.
W74-11576 5G

Water Quality Implications of Cropland Nutrients,
W74-11607 6G

FILTRATION
Further Purification of Biologically Treated Waste Water Treatment Plant Effluents by Means of Microstrainers (Weiterreinigung Biologisch Behandelter Klaeranlagenablaeufe Mit Hilfe Von Microstrainern),
W74-11856 5D

FISH
Mercury Content of Oregon Groundfish,
W74-11717 5A

Mercury Concentrations in Tissues of Fish from the Connecticut River,
W74-11917 5B

FISH FARMING
Paunch Manure as a Feed Supplement in Channel Catfish Farming,
W74-11796 5C

FISH HATCHERIES
Effects of Water Reuse on Rainbow Trout in Hatcheries,
W74-11940 5C

Preliminary Studies Using Synthetic Polymers to Reduce Turbidity in a Hatchery Water Supply,
W74-11942 5C

Effects of Hatchery Water Reuse on Rainbow Trout Metabolism,
W74-11943 5C

Factors Influencing Formalin Toxicity in Trout,
W74-11947 5C

FISH POPULATIONS
The Relation Between Water Quality and the Status of Fish Populations in Willow Brook,
W74-11932 5C

FISH REPRODUCTION
Effect of Rate and Duration of Feeding DDT on the Reproduction of Salmonid Fishes Reared and Held Under Controlled Conditions,
W74-11933 5C

FISHERIES
Limnological and Fisheries Aspects of the River and the Proposed Reservoir,
W74-11582 6B

FISHING
Hydrology and Recreation on the Cold-Water Rivers of Michigan's Upper Peninsula,
W74-11986 6B

FISHKILL
Effect of Rate and Duration of Feeding DDT on the Reproduction of Salmonid Fishes Reared and Held Under Controlled Conditions,
W74-11933 5C

Mass Stranding of Molluscs at Te Waewae Bay, Southland, New Zealand,
W74-11938 5C

FLASH DISTILLATION
Conceptual Design and Cost Estimate of a Vapor Compression VTE/MSF Desalting Plant,
W74-11630 3A

Operation of the 16-Stage MSF Pilot Plant--1969-1970,
W74-11631 3A

Evaluation of the Capabilities of the Vertical Tube Evaporator and the Multistage Flash Distillation Desalination Processes.
W74-11632 3A

Development Program and Test Instrumentation for VTE/MSF Module Plant, Fountain Valley, California.
W74-11635 3A

Conceptual Design and Cost Estimate 2.5 MGD Direct Contact Condensation Multistage Flash Desalination Plant,
W74-11637 3A

Analysis of Existing Data from the San Diego Test Facility, Phase II Final Report,
W74-11638 3A

Annual Report - Vertical Tube Evaporator Multistage Flash Test Bed Plant, Freeport, Texas, March 19, 1971 to March 31, 1972.
W74-11807 3A

Summary of Desalination Plant Brine Disposal Methods for Inland Locations, Final Report, February 1971.
W74-11808 3A

Indexed Bibliography on Corrosion and Performance of Materials in Saline Water Conversion Processes-1.
W74-11823 3A

Final Report Study of the Application of Aluminum as a Principal Material of Construction in a 50 MGD Multistage Flash Distillation System.
W74-11824 3A

Preliminary Evaluation of Fluidic Techniques for Flow Modulation in the Multi-Stage Flash Distillation Process,
W74-11827 3A

Annual Report - San Diego Test Facility, January 1, 1971 - February 15, 1972.
W74-11828 3A

200 MGD Desalting Plant Conceptual Study, Advanced Thin Film Distillation Process and Test Module Design.
W74-11830 3A

MSF Distillation Plant (Module), Vertical Tube Evaporation (VTEX), Semi-Annual Report, June 1, 1970, through December 31, 1970,
W74-11831 3A

FLOCCULATION
Characterization and Treatability of Chrome Tanning Waste,
W74-11707 5D

Preliminary Studies Using Synthetic Polymers to Reduce Turbidity in a Hatchery Water Supply,
W74-11942 5C

FLOOD CONTROL
Measurement of Discharge as Inflow Into Leaky Reservoirs,
W74-11529 7B

Water Control on Agricultural Land,
W74-11612 6B

Urban Flood Damages,
W74-11622 6B

Flood Plain Information, Ohio River: Ohio County, West Virginia.
W74-11677 4A

Rural and Urban Flood Insurance: A Review,
W74-11688 6F

FLOW MEASUREMENTS
Le (Leading Edge) Flowmeter--A Unique Device for Open Channel Discharge Measurement,
W74-11533 7B

FLOW PROFILES
Hypolimnetic Flow Regimes in Lakes and Impoundments,
W74-11578 8B

FLOWMETERS
Ultrasonic Measurement of Discharge in Rivers,
W74-11528 7B

Le (Leading Edge) Flowmeter--A Unique Device for Open Channel Discharge Measurement,
W74-11533 7B

FLUMES
Laboratory Calibration of the Walnut Gulch Supercritical Flow-Measuring Flume,
W74-11519 7B

FLUORESCENT DYE
Techniques for Measurement of Discharge by Dye Dilution,
W74-11513 7B

FLUORESCENT DYE

Stream Hydrographs by Fluorescent Tracers,
W74-11514 7B

Time of Travel and Dye Dosage for an Irrigation Canal System Near Duchesne, Utah,
W74-11970 2E

FLUORESCENT DYES
Field Studies of Sediment Movement Using Fluorescent Tracers,
W74-11544 2J

FOOD PROCESSING INDUSTRY
Water and Waste Management in Poultry Processing,
W74-11789 5D

FOOD WASTES
Demonstration of a Full-Scale Waste Treatment System for a Cannery,
W74-11925 5D

FOOD WEBS
Observations on the Distribution of Chlorinated Hydrocarbons in Atlantic Ocean Organisms,
W74-11484 5B

FORD COUNTY (IL)
Public Groundwater Supplies in Ford County,
W74-11883 4B

FORECASTING
Recreation Use Projections for the Proposed Ames Reservoir and Alternatives,
W74-11599 6B

Use of Rivers to Predict Accumulation in Sediment of Radio-nuclides Discharged from Nuclear Power Stations,
W74-11654 5B

Modeling Radiation Exposure to Populations from Radioactivity Released to the Environment,
W74-11655 5B

The Present and Future Situation of Nuclear Energy Production and its Associated Industry--Normal Operation, Accident Prevention and Mitigation, Comparative Risk Assessment,
W74-11953 5C

Projections of Radioactive Wastes to be Generated by the U.S. Nuclear Power Industry,
W74-11962 5G

FOREST FIRES
Water Quality Investigations on Forested Catchments in the Cotter River Valley,
W74-11692 5B

FOREST WATERSHEDS
Water Quality Investigations on Forested Catchments in the Cotter River Valley,
W74-11692 5B

FORMALIN
Factors Influencing Formalin Toxicity in Trout,
W74-11947 5C

FORT WORTH (TX)
Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1972,
W74-11737 2F

FOULING
Development of Sea Water Membranes, Part II,
W74-11644 3A

FRESHWATER FISH
Trace Metals in New York State Fish,
W74-11934 5C

FROST
Snow and Frost Depths on North and South Slopes,
W74-11724 2C

FUEL REPROCESSING
The Present and Future Situation of Nuclear Energy Production and its Associated Industry--Normal Operation, Accident Prevention and Mitigation, Comparative Risk Assessment,
W74-11953 5C

Environmental Control in Nuclear Fuel Reprocessing,
W74-11955 5B

Projections of Radioactive Wastes to be Generated by the U.S. Nuclear Power Industry,
W74-11962 5G

FUEL REPROCESSING PLANTS
Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

FUELS
Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

Environmental Control in Nuclear Fuel Reprocessing,
W74-11955 5B

GAGES
The Analysis of Float and Hydrostatic Level Gauges and the Choice of Optimal Values of Their Basic Elements,
W74-11494 7B

A Portable Water-Stage Recorder for Experimental Hydrological Measurements,
W74-11497 7B

Water-Level Transducers,
W74-11498 7B

GAGING STATIONS
Symposium on Hydrometry, Volume I and II.
W74-11493 7B

Stream Gauging Network of the Lower Mekong Basin,
W74-11499 7B

Problems in the Design of Measuring Structures,
W74-11507 7B

Stream Gauging with Portable Equipment,
W74-11516 7B

Gauging Stations on Sediment-Loaded Mountain Rivers,
W74-11522 7B

Flow Measurement of Low-Gradient Streams in Sandy Soils,
W74-11523 7B

GAMMA RADIATION
Gamma Radiation as an Effective Disinfectant,
W74-11860 5D

GAMMA RAYS
Gamma Radiation as an Effective Disinfectant,
W74-11860 5D

GAS BUBBLE DISEASE
Surface Agitators as a Means to Reduce Nitrogen Gas in a Hatchery Water Supply,
W74-11936 5C

GAS CHROMATOGRAPHY
Analysis of Coprostanol, an Indicator of Fecal Contamination,
W74-11794 5A

Investigation of Volatile Organic Micropollutants in Air and Water Using Low-Temperature Capillary GC-MS,
W74-11863 5A

GAS COOLED REACTORS
Final Environmental Statement Related to the Proposed Summit Power Station Units 1 and 2 - Delmarva Power and Light Company.
W74-11675 5B

GATES
Spillway for Lock and Dam 26, Mississippi River, Missouri and Illinois,
W74-11990 8B

GEOCHEMISTRY
Geochemical Methods in Geothermal Exploration,
W74-11786 2K

GEOGRAPHICAL REGIONS
Unit Hydrographs for Catchments of Different Sizes and Dissimilar Regions,
W74-11466 2A

Water Development and Urban Development in Africa,
W74-11685 6B

GEOLOGICAL SURVEYS
The Uses of Geophysical Methods in Hydrogeological Investigations in Israel,
W74-11906 2F

GEOLOGY
The Role of Geology and Hydrology in Geothermal Exploration,
W74-11761 4B

GEOPHYSICS
Detection of Subsurface Cavities,
W74-11756 4B

Geophysical Methods in Geothermal Exploration,
W74-11762 4B

The Uses of Geophysical Methods in Hydrogeological Investigations in Israel,
W74-11906 2F

Application of Surface Geophysics to Groundwater Investigations,
W74-11996 4B

GEORGIA
Flow Measurement of Low-Gradient Streams in Sandy Soils,
W74-11523 7B

Observations on Manganese in Georgia Waters,
W74-11712 5F

GEOSTROPHIC
On the Dynamics of Wind-Driven Lake Currents,
W74-11895 2H

GEOTHERMAL BRINES
VTE Evaporators for Geothermal Brines,
W74-11829 3A

GEOTHERMAL ENERGY
Well Measurements,
W74-11760 4B

The Role of Geology and Hydrology in Geothermal Exploration,
W74-11761 4B

Geophysical Methods in Geothermal Exploration,
W74-11762 4B

Geochemical Methods in Geothermal Exploration,
W74-11786 2K

GEOTHERMAL STUDIES
Well Measurements,
W74-11760 4B

The Role of Geology and Hydrology in Geothermal Exploration,
W74-11761 4B

Geophysical Methods in Geothermal Exploration,
W74-11762 4B

Geochemical Methods in Geothermal Exploration,
W74-11786 2K

GERMANY
Water-Level Gauging by Pressure Measuring,
W74-11500 7B

Determination of the BOD5 in Running Waters by Means of Biological Water Analysis,
W74-11546 5A

Practical Experience with Devices to Measure O2 Content, Turbidity, Solid Matter Content and Electrical Conductivity Used for Monitoring Water Quality in Rivers,
W74-11548 5A

Special Hydrometric Ships for the Inland Waterways of the Federal Republic of Germany,
W74-11551 7B

GERMANY (BAVARIAN PREALPS)
Deuterium and Oxygen-18 Measurements on Surface Waters of the Bavarian Prealps,
W74-11550 2K

GERMANY (EMSCHER RIVER)
Measuring Devices in Stationary and Mobile Control Stations for the Supervision of Rivers, Shown by the Example of the Lippe and Emscher Rivers,
W74-11554 7B

Radio Control of Water Level Gauges in Watercourses Endangered by High Water Levels,
W74-11557 7B

GERMANY (LIPPE RIVER)
Measuring Devices in Stationary and Mobile Control Stations for the Supervision of Rivers, Shown by the Example of the Lippe and Emscher Rivers,
W74-11554 7B

Radio Control of Water Level Gauges in Watercourses Endangered by High Water Levels,
W74-11557 7B

GLYCOL
Treatment of Waste Water from the Production of Polyhydric Organics.
W74-11926 5D

GOLD
Algal Ecology of a Stream Polluted Through Gold Mining on the Witwatersrand,
W74-11710 5C

GRAND VALLEY (CO)
Evaluation of Irrigation Scheduling for Salinity Control in Grand Valley,
W74-11929 5G

GRANITE PROCESSING WASTES
Granite Industry Wastewater Treatment,
W74-11790 5D

GRANITES
Deep Self-Burial of Radioactive Wastes by Rock-Melting Capsules,
W74-11664 5E

GRAVITY STUDIES
Application of Surface Geophysics to Groundwater Investigations,
W74-11996 4B

GREAT LAKES
Great Lakes Ice Cover, Winter 1970-71,
W74-11777 2C

Research Prospectus for Marine Pollution Control in the Great Lakes.
W74-12000 5G

GREAT PLAINS
Digital Model of the Ogallala Aquifer of the Northern Part of the Northern High Plains of Colorado,
W74-11741 2F

GREAT SMOKY MOUNTAINS NATIONAL PARK
Transfer of Mercury and Cadmium from Terrestrial to Aquatic Ecosystems,
W74-11703 5B

GROUNDFISH
Mercury Content of Oregon Groundfish,
W74-11717 5A

GROUNDWATER
Hydrogeology of the USSR. Volume 4: Voronezh, Kursk, Belgorod, Bryansk, Orlov, Lipetsk, and Tambov Oblasts (Gidrogeologiya SSSR. Tom IV. Voronezhskaya, Kurskaya, Belgorodskaya, Bryanskaya, Orlovskaya, Lipetskaya, Tambovskaya Oblasti).
W74-11453 4B

Hydrogeology of the USSR. Volume 17: Kemerovo Oblast and Altay Territory (Gidrogeologiya SSSR. Tom XVII. Kemerovskaya oblast' i Altayskiy kray).
W74-11454 4B

Hydrogeology of the USSR. Volume 26. Soviet North East (Gidrogeologiya SSSR. Tom XXVI. Severo-Vostok).
W74-11455 4B

Hydrologic Investigations of the Groundwaters of Central Texas Using U-234/U-238 Disequilibrium,
W74-11465 2F

On a Possible Extension of Darcy's Law,
W74-11472 2F

Method of Additional Seepage Resistances--Theory and Application,
W74-11479 4B

Polluted Groundwater: A Review of the Significant Literature,
W74-11800 5B

Groundwater Contamination in the Northeast States,
W74-11806 5B

Groundwater and Geology of Baraga County, Michigan,
W74-11987 4B

Groundwater Resources of Brazos and Burleson Counties, Texas,
W74-11994 4B

GROUNDWATER BASINS
Hydrogeology of the USSR. Volume 17: Kemerovo Oblast and Altay Territory (Gidrogeologiya SSSR. Tom XVII. Kemerovskaya oblast' i Altayskiy kray).
W74-11454 4B

GROUNDWATER MOVEMENT
Groundwater Occurrence and Movement in the Athol Area and the Northern Rathdrum Prairie, Northern Idaho,
W74-11730 2F

Electric-Analog Simulation network of Unconsolidated Aquifers in the Upper Wabash River Basin, Indiana,
W74-11736 4B

GROUNDWATER RESOURCES
Hydrogeology of the USSR. Volume 4: Voronezh, Kursk, Belgorod, Bryansk, Orlov, Lipetsk, and Tambov Oblasts (Gidrogeologiya SSSR. Tom IV. Voronezhskaya, Kurskaya, Belgorodskaya, Bryanskaya, Orlovskaya, Lipetskaya, Tambovskaya Oblasti).
W74-11453 4B

Evaluation of the Groundwater Resource in the Upper Skunk River Basin,
W74-11616 6B

Public Groundwater Supplies in Crawford County,
W74-11880 4B

Public Groundwater Supplies in Brown County,
W74-11881 4B

Public Groundwater Supplies in Boone County,
W74-11882 4B

Public Groundwater Supplies in Ford County,
W74-11883 4B

Public Groundwater Supplies in Hardin County,
W74-11884 4B

Public Groundwater Supplies in Kendall County,
W74-11885 4B

Public Groundwater Supplies in Edgar County,
W74-11886 4B

Public Groundwater Supplies in Alexander County,
W74-11887 4B

GROWTH RATE
Biologically Allowable Thermal Pollution Limits, Part I and Part II,
W74-11921 5C

Environmental Evaluation Based on Relative Growth Rates of Fishes,
W74-11937 5C

GUIDELINES
Joint Construction Sediment Control Project,
W74-11923 4D

HARBORS
Channel Friction and Slope Effects on Harbor Resonance,
W74-11480 8B

A Model of Circulation and Dispersion in Pearl Harbor,
W74-11769 5B

HARDIN COUNTY (IL)
Public Groundwater Supplies in Hardin County,
W74-11884 4B

HARMONIC ANALYSIS
Quadratic Loss and Scattering of Long Waves,
W74-11478 8B

HAWAII
Rainfall Intensities in the Conterminous United States and Hawaii (Supplement 1 to ETL-SR-72-5: Distribution of Mean Monthly Precipitation and Rainfall Intensities),
W74-11747 2B

A Model of Circulation and Dispersion in Pearl Harbor,
W74-11769 5B

HAY
Simplified Atomic Absorption Determination of Stable Strontium in Milk and Hay: A Comparison of Methods and Stepwise Procedure,
W74-11652 5A

HEAT EXCHANGERS
Conceptual Design and Cost Estimate 2.5 MGD Direct Contact Condensation Multistage Flash Desalination Plant,
W74-11637 3A

HEAT RESISTANCE
Biologically Allowable Thermal Pollution Limits, Part I and Part II,
W74-11921 5C

HEAT TRANSFER
Operation of the 16-Stage MSF Pilot Plant--1969-1970,
W74-11631 3A

Fourth Report on Horizontal-Tube Multiple-Effect (HTME) Process Pilot Plant Test Program,
W74-11633 3A

Fifth Report on Horizontal-Tube Multiple Effect (HTME) Process Pilot Plant Test Program,
W74-11634 3A

An Investigation of the Variables Affecting Steam Condensation on the Outside of a Horizontal Tube Bundle,
W74-11639 3A

HEAVY METALS
The Trace Analysis of Water for Selected Metallic Elements Employing Square-Wave Polarography,
W74-11679 5A

Atomic Absorption Determination of Elemental Mercury Collected from Ambient Air on Silver Wool,
W74-11705 5A

Standards for the Prevention of Occupational Lead Poisoning,
W74-11714 5C

Biologic Effect of Metallic Contaminants-The Next Step,
W74-11720 5C

Recovery of Heavy Metals from Waste Acid (Haisan Kara No Jukinzoku No Kaishu),
W74-11879 5D

Concentration of Heavy Metals in Sediment Cores from Selected Wisconsin Lakes,
W74-11915 5B

How Much Metal is There in Our Waters,
W74-11918 5B

Trace Metals in New York State Fish,
W74-11934 5C

HELIX ASPERSA
Lethality and Behavioral Symptoms Produced by Some Organophosphorous Compounds in the Snail (Helix Aspersa),
W74-11483 5C

HELLMANN PRECIPITATION GAUGE
Evaporation Losses from Containers of Hellmann Precipitation Gauges,
W74-11909 2B

HERBICIDES
Water Quality Implications of Pesticides,
W74-11608 6G

Herbicide Runoff from Four Coastal Plain Soil Types,
W74-11805 5B

Pesticide Movement from Cropland into Lake Erie,
W74-11922 5B

Assessment of the Ecological Consequences of Herbicide Use Along Transmission Line Rights-of-Way and Recommendation for Such Use,
W74-11977 5C

HIGHWAY RELOCATION
Direct Reservoir Impact,
W74-11593 6B

HILLSBOROUGH RIVER (FL)
Flood Profiles of the Lower Hillsborough River, Florida,
W74-11735 2E

HISTORIC FLOOD
Floods of January 1974 in Washington,
W74-11752 2E

HOGS
A Waste Treatment System for Confined Hog Raising Operations,
W74-11792 5D

HORTONS LAW
A Modified Horton Equation for Infiltration During Intermittent Rainfall,
W74-11907 2G

HUDSON RIVER
Population, Resources, and Pollution, and Their Impact on the Hudson Estuary,
W74-11870 5B

Sediment and Waste Deposition in New York Harbor,
W74-11874 5B

HUMAN PATHOLOGY
Health Hazards of Lead.
W74-11706 5C

Biochemical Responses to Provocative Chelation by Edetate Disodium Calcium,
W74-11723 5C

HUMAN POPULATION
Population Projections for Ames and the Reservoir Area of Influence,
W74-11615 6B

HUMID AREAS
A Method for Integrating Surface and Ground Water Use in Humid Regions,
W74-11964 5F

HUNGARY
Estimation of Streamflow Under Ice Cover,
W74-11512 2E

Hydra II--Automatic Digital Telemetering System,
W74-11555 7B

HUNGRY HORSE RESERVOIR (MT)
Computer Model for Determining Bank Storage at Hungry Horse Reservoir, Northwestern Montana,
W74-11732 4B

HURRICANE AGNES
Hydrologic Impact of Tropical Storm Agnes,
W74-11892 2B

HURRICANES
Hydrologic Impact of Tropical Storm Agnes,
W74-11892 2B

HYCO LAKE (NC)
The Effect of Heated Water on the Temperature and Evaporation of Hyco Lake, North Carolina, 1966-72,
W74-11751 5C

HYDRAULIC DESIGN
Spillway Crest Design,
W74-11757 8B

HYDRAULIC FRACTURING
Cost and Feasibility of Stimulating Tight Gas Reservoirs with Chemical Explosives,
W74-11663 8H

HYDRAULIC JUMP
Circular Jumps,
W74-11476 8B

HYDRAULIC MODELS
Hydraulic Model Study to Determine a Stage-Discharge Relationship,
W74-11531 2E

HYDROELECTRIC POWER
Effects of Hydroelectric Development in Western Canada on Aquatic Ecosystems,
W74-11944 5C

HYDROGEN ION CONCENTRATION
The Effects of Total Dissolved Solids, Temperature, and pH on the Survival of Immature Striped Bass: A Response Surface Experiment,
W74-11935 5C

HYDROGEOLOGY
Hydrogeology of the USSR. Volume 4: Voronezh, Kursk, Belgorod, Bryansk, Orlov, Lipetsk, and Tambov Oblasts (Gidrogeologiya SSSR. Tom IV. Voronezhskaya, Kurskaya, Belgorodskaya, Bryanskaya, Orlovskaya, Lipetskaya, Tambovskaya Oblasti).
W74-11453 4B

Hydrogeology of the USSR. Volume 17: Kemerovo Oblast and Altay Territory (Gidrogeologiya SSSR. Tom XVII. Kemerovskaya oblast' i Altayskiy kray).
W74-11454 4B

Hydrogeology of the USSR. Volume 26. Soviet North East (Gidrogeologiya SSSR. Tom XXVI. Severo-Vostok).
W74-11455 4B

Hydrologic Investigations of the Groundwaters of Central Texas Using U-234/U-238 Disequilibrium,
W74-11465 2F

Groundwater Occurrence and Movement in the Athol Area and the Northern Rathdrum Prairie, Northern Idaho,
W74-11730 2F

The Role of Geology and Hydrology in Geothermal Exploration,
W74-11761 4B

The Uses of Geophysical Methods in Hydrogeological Investigations in Israel,
W74-11906 2F

Hydrogeological Maps of Korea, 2. Upper Jinwi River Basin, (In Korean),
W74-11908 7C

Geology and Groundwater for Land-use Planning in the Eagle River-Chugiak Area, Alaska,
W74-11982 4B

Hydrology of the Columbia (Pleistocene) Deposits of Delaware: An Appraisal of a Regional Water-Table Aquifer,
W74-11993 4B

HYDROGRAPH ANALYSIS

The Evaluation of Discharge Measurements in Streams with Changing Flow Conditions,
W74-11508 7B

Analogue to Digital Conversion and Data Acquisition from Charts of Water Level and Rainfall Recorders and Their Evaluation by a Computer,
W74-11564 7C

Manual and Automatic Evaluation of Hydrometric Data in Israel,
W74-11565 7C

Experiences with a Fully Automatic Curve Scanner,
W74-11566 7C

Urban Runoff by Linearized Subhydrographic Method,
W74-11890 2A

HYDROGRAPHS

Stream Hydrographs by Fluorescent Tracers,
W74-11514 7B

Discharge Measurement in Open Water by Means of Magnetic Induction,
W74-11526 7B

HYDROGRAPHY

The Development and Performance of a New High Accuracy Hydrographic Tellurometer Model MRB 201,
W74-11535 7B

Modern Position Fixing Methods,
W74-11536 7B

The Application of an Orientation System for Continuous Observations for the Compilation of River Channel Maps by Means of an Echo Sounder,
W74-11537 7B

Digital Measurements of River Bed Profiles Using a General-Purpose Data Acquisition System,
W74-11538 7B

Coon Rapids Pool Hydrographic Study,
W74-11981 2E

HYDROLOGIC ASPECTS

Hydrologic Impact of Tropical Storm Agnes,
W74-11892 2B

A Hydrological Study of the Southern Sudd Region of the Upper Nile,
W74-11905 4A

HYDROLOGIC DATA

Methods of Flood Flow Determination in Sparse Data Regions,
W74-11458 4A

A Contribution to Statistical Depth-Duration-Frequency Analysis,
W74-11469 2B

Recording and Teletransmission of Measured Data in Hydrology and Relevant WMO Activities,
W74-11559 7B

The Criterion of Information Sufficiency with Automation of Hydrological Measurements,
W74-11561 7B

Developments in the Processing of Hydrological Data in Australia,
W74-11562 7C

Methods and Means for Preparing Hydrological Observation Results for Processing on Computers,
W74-11563 7C

Analogue to Digital Conversion and Data Acquisition from Charts of Water Level and Rainfall Recorders and Their Evaluation by a Computer,
W74-11564 7C

Manual and Automatic Evaluation of Hydrometric Data in Israel,
W74-11565 7C

Experiences with a Fully Automatic Curve Scanner,
W74-11566 7C

Streamflow, Sediment, and Turbidity in the Mad River Basin, Humboldt and Trinity Counties, California,
W74-11770 2E

Hydrologic Impact of Tropical Storm Agnes,
W74-11892 2B

Hydrogeological Maps of Korea, 2. Upper Jinwi River Basin, (In Korean),
W74-11908 7C

Water Resources of the Laramie, Shirley, Hanna Basins and Adjacent Areas, Southeastern Wyoming,
W74-11983 7C

Hydrology of the Columbia (Pleistocene) Deposits of Delaware: An Appraisal of a Regional Water-Table Aquifer,
W74-11993 4B

Hydrologic Data for Cow Bayou Brazos River Basin Texas, 1972,
W74-11999 7C

HYDROLOGIC MODELS

Urban Runoff by Linearized Subhydrographic Method,
W74-11890 2A

HYDROLOGIC SYSTEMS

Flow Simulation System,
W74-11477 2E

HYDROLOGICAL DATA

Studies on Modeling of Urban Storm Water Runoff--on the Relation Between the Composition of Basin Model and the Equivalent Roughness,
W74-11855 5B

HYDROLOGY

The Role of Geology and Hydrology in Geothermal Exploration,
W74-11761 4B

HYDROLYSIS

The Measurement of Mean Temperature on a Reaction Velocity Basis and its Application to Hydrology,
W74-11539 7B

HYDROMETRY

Symposium on Hydrometry, Volume I and II.
W74-11493 7B

HYPOLIMNETIC FLOW REGIMES

Hypolimnetic Flow Regimes in Lakes and Impoundments,
W74-11578 8B

ICE

Application of Thermal Imagery to the Development of a Great Lakes Ice Information System,
W74-11784 7B

ICE COVER

Measurement of Discharge Under Ice Cover,
W74-11511 7B

Estimation of Streamflow Under Ice Cover,
W74-11512 2E

Studies of the Inner Shelf and Coastal Sedimentation Environment of the Beaufort Sea from ERTS-1,
W74-11728 2L

Ice Development on Lake Champlain,
W74-11772 2H

Great Lakes Ice Cover, Winter 1970-71,
W74-11777 2C

IDAHO

Groundwater Occurrence and Movement in the Athol Area and the Northern Rathdrum Prairie, Northern Idaho,
W74-11730 2F

Application of Remote Sensing in the Study of Vegetation and Soils in Idaho,
W74-11738 4A

Surface Agitators as a Means to Reduce Nitrogen Gas in a Hatchery Water Supply,
W74-11936 5C

ILLINOIS

Methods of Liquid Fertilizer Application,
W74-11839 5D

Flood Plain Management in Metropolitan Chicago,
W74-11867 6F

ILLINOIS

Public Groundwater Supplies in Crawford County,
W74-11880 4B

Public Groundwater Supplies in Brown County,
W74-11881 4B

Public Groundwater Supplies in Boone County,
W74-11882 4B

Public Groundwater Supplies in Ford County,
W74-11883 4B

Public Groundwater Supplies in Hardin County,
W74-11884 4B

Public Groundwater Supplies in Kendall County,
W74-11885 4B

Public Groundwater Supplies in Edgar County,
W74-11886 4B

Public Groundwater Supplies in Alexander County,
W74-11887 4B

Variation in Bluff Recession in Relation to Lake Level Fluctuations Along the High Bluff Illinois Shore,
W74-11974 2J

Spillway for Lock and Dam 26, Mississippi River, Missouri and Illinois,
W74-11990 8B

IMMATURE GROWTH STAGE
Salinity and Temperature Tolerance of Zoeae of the Portunid Crab Scylla Serrata,
W74-11950 5C

IMPACT OF CONSTRUCTION PROCESS
Proceedings: Planning and Design for Urban Runoff and Sediment Management.
W74-11678 4D

IMPERIAL VALLEY (CA)
VTE Evaporators for Geothermal Brines,
W74-11829 3A

INCINERATION
Evaluation of a Field-Type Incineration for Human Waste, (Theater of Operation Sewage Treatment Systems),
W74-11785 5D

INDIA
Characterization and Treatability of Chrome Tanning Waste,
W74-11707 5D

INDIANA
U.S. Geological Survey Water Quality Program, Indiana District,
W74-11734 5A

Electric-Analog Simulation network of Unconsolidated Aquifers in the Upper Wabash River Basin, Indiana,
W74-11736 4B

Soil-Water Regimes in Brookston and Crosby Soils,
W74-11899 2G

INDIRECT BENEFITS
Indirect Economic Effects,
W74-11590 6B

INDUSTRIAL WASTES
Mercury Recovery from Process Sludges,
W74-11699 5D

Pollution and Poisoning,
W74-11702 5B

Characterization and Treatability of Chrome Tanning Waste,
W74-11707 5D

Biologic Effect of Metallic Contaminants-The Next Step,
W74-11720 5C

Lead in New-Fallen Snow Near a Lead Smelter,
W74-11722 5B

Solvent Extraction of Nitrate from Titanium Leacher Effluent,
W74-11763 5D

Water and Waste Management in Poultry Processing,
W74-11789 5D

Color Characterization Before and After Lime Treatment,
W74-11793 5D

Protein Production from Acid Whey Via Fermentation,
W74-11795 5D

Treatment of Packinghouse Wastes by Anaerobic Lagoons and Plastic-Media Filters,
W74-11797 5D

A Test Method for Volatile Component Stripping of Waste Water,
W74-11801 5D

A Survey of Land Application of Waste Water Facilities,

MINING WASTES
State-of-the-Art: Uranium Mining, Milling, and Refining Industry.
W74-11791 5D

MINNESOTA
Flood-Plain Areas of the Lower Minnesota River.
W74-11969 7C

Coon Rapids Pool Hydrographic Study,
W74-11981 2E

MINNESOTA RIVER
Flood-Plain Areas of the Lower Minnesota River.
W74-11969 7C

MISSISSIPPI
Extracting Land Use Information from the Earth Resources Technology Satellite Data by Conventional Interpretation Methods,
W74-11729 7B

Remote Sensing Study of Land Use and Sedimentation in the Ross Barnett Reservoir, Jackson, Mississippi, Area,
W74-11963 4A

MISSISSIPPI RIVER
Mississippi River Water from Texas,
W74-11766 4A

Coon Rapids Pool Hydrographic Study,
W74-11981 2E

Seepage in Mississippi River Banks: Report 1, Analysis of Transient Seepage Using a Viscous-Flow Model and the Finite Difference and Finite Element Methods,
W74-11989 4A

Spillway for Lock and Dam 26, Mississippi River, Missouri and Illinois,
W74-11990 8B

MISSOURI
A Waste Treatment System for Confined Hog Raising Operations,
W74-11792 5D

Spillway for Lock and Dam 26, Mississippi River, Missouri and Illinois,
W74-11990 8B

MIXING
Movement and Dispersion of Soluble Materials in Salem Creek, Muddy Creek and Yadkin River Between Winston-Salem and Salisbury, North Carolina,
W74-11749 5B

MODEL STUDIES
Flow Simulation System,
W74-11477 2E

Method of Additional Seepage Resistances--Theory and Application,
W74-11479 4B

Modeling Radiation Exposure to Populations from Radioactivity Released to the Environment,
W74-11655 5B

An Evaluation of Farm Irrigation Practices as a Means to Control the Water Quality of Return Flow,
W74-11681 3C

Experimental Investigations on the Accumulation of Mercury in Water Organisms,
W74-11704 5C

Electric-Analog Simulation network of Unconsolidated Aquifers in the Upper Wabash River Basin, Indiana,
W74-11736 4B

A Model of Circulation and Dispersion in Pearl Harbor,
W74-11769 5B

Studies on Modeling of Urban Storm Water Runoff--on the Relation Between the Composition of Basin Model and the Equivalent Roughness,
W74-11855 5B

Studies on Runoff Characteristics in Channel Network Systems in Low Land,
W74-11865 2A

A Mathematical Model of Transport, Diffusion and Degradation of Organic Matter in a River,
W74-11875 5G

The Illinois Urban Drainage Area Simulator, ILLUDAS,
W74-11889 5B

Pesticide Transport and Runoff Model for Agricultural Lands,
W74-11920 5B

MOLECULAR STRUCTURE
Biologically Allowable Thermal Pollution Limits, Part I and Part II,
W74-11921 5C

MOLLUSCS
Mass Stranding of Molluscs at Te Waewae Bay, Southland, New Zealand,
W74-11938 5C

MOLLUSKS
Method for Indirectly Defining Optimum Temperatures of Inhabitancy for Marine Cold-Blooded Animals,
W74-11487 5C

MOLYBDENUM
Effect of Molybdenum Starvation and Tungsten on the Synthesis of Nitrogenase Components in Klebsiella pneumoniae,
W74-11713 5C

MONITORING
Instrumentation Considerations for Studies of Quality of Runoff From Small Agricultural Watersheds,
W74-11545 7B

Determination of the BOD5 in Running Waters by Means of Biological Water Analysis,
W74-11546 5A

Practical Experience with Devices to Measure O2 Content, Turbidity, Solid Matter Content and Electrical Conductivity Used for Monitoring Water Quality in Rivers,
W74-11548 5A

The Colorimetric Front-End Sensors in Automatic Surveillance of Water Quality,
W74-11549 5A

Measuring Devices in Stationary and Mobile Control Stations for the Supervision of Rivers, Shown by the Example of the Lippe and Emscher Rivers,
W74-11554 7B

Hydra II--Automatic Digital Telemetering System,
W74-11555 7B

Water-Quality Monitoring and Data Transmission,
W74-11556 7B

Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1972.
W74-11658 5B

Environmental Monitoring Report - United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1971.
W74-11659 5B

Environmental Levels of Radioactivity in the Vicinity of the Lawrence Livermore Laboratory - 1973 Annual Report,
W74-11660 5B

Control and Treatment of Radioactive Liquid Waste Effluents at the Savannah River Plant,
W74-11661 5D

Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1973.
W74-11667 5B

Applied Health Physics and Safety Annual Report 1971,
W74-11669 5B

MONITORING

Tritium Control Technology,
W74-11673 5D

Wastewater Sampling and Testing Instrumentation,
W74-11754 5A

Polluted Groundwater: A Review of the Significant Literature,
W74-11800 5B

New Global Watch for Pollution Effects.
W74-11866 5A

Environmental Monitoring Report, Period Covering May 1, 1973 Through July 31, 1973 for El Paso Natural Gas Company.
W74-11954 5B

Environmental Control in Nuclear Fuel Reprocessing,
W74-11955 5B

Environmental Monitoring at the Pacific Northwest Laboratory by Battelle-Northwest,
W74-11956 5B

Aerial Radiological Measuring Survey of the Area Surrounding the Hallam Nuclear Power Favility, Hallam, Nebraska, September 20, 1968.
W74-11960 5B

A Network for Continuous Monitoring of Water Quality in the Trinity River Basin, Texas,
W74-11995 5B

MONOMOLECULAR FILMS
Desalination Membranes from Built-Up Multilayer Films,
W74-11636 3A

Control and Confinement of Oil Pollution on Water with Monomolecular Surface Films,
W74-11781 5G

MONTANA
An Investigation into the Extent and Cause of Eutrophication in Canyon Ferry Reservoir, Montana,
W74-11573 5C

Computer Model for Determining Bank Storage at Hungry Horse Reservoir, Northwestern Montana,
W74-11732 4B

MORONE SAXATILIS
The Effects of Total Dissolved Solids, Temperature, and pH on the Survival of Immature Striped Bass: A Response Surface Experiment,
W74-11935 5C

MORTALITY
Effect of Rate and Duration of Feeding DDT on the Reproduction of Salmonid Fishes Reared and Held Under Controlled Conditions,
W74-11933 5C

MOSQUITO CONTROL
Effects of Salt Marsh Impoundments on Mosquito Populations,
W74-11461 5C

MOSQUITOES
Effects of Salt Marsh Impoundments on Mosquito Populations,
W74-11461 5C

MULTILAYER APPARATUS
Desalination Membranes from Built-Up Multilayer Films,
W74-11636 3A

MULTIPLE-PURPOSE PROJECTS
Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact,
W74-11586 6B

Parameter Values for Benefit-Cost Analysis,
W74-11589 6B

A View of the Valley's People,
W74-11592 6B

Ames Reservoir Environmental Study. Appendix 5. Physical Relationship with the Urban Sector.
W74-11614 6B

MULTIPURPOSE PROJECTS
Ames Reservoir Environmental Study. Appendix 4. Physical Relationships with the Agricultural Sector.
W74-11605 6B

MUNICIPAL WASTES
Land Application of Sewage Effluents and Sludges: Selected Abstracts,
W74-11577 5D

Proceedings of Conference on Land Disposal of Municipal Effluents and Sludges,
W74-11833 5D

EPA Viewpoint on Land Application of Liquid Effluents,
W74-11844 5D

Municipal Effluent Characteristics,
W74-11847 5B

Experiences With Land Spreading of Municipal Effluents,
W74-11850 5D

A Survey of Land Application of Waste Water Facilities,
W74-11852 5D

Some Nutritional Characteristics of Spirulina maxima Algae Grown in Effluents from Biological Treatment Plant,
W74-11872 5C

Soil Systems For Municipal Effluents - A Workshop and Selected References,
W74-11924 5D

MUNICIPAL WATER
A Method for Integrating Surface and Ground Water Use in Humid Regions,
W74-11964 5F

MUSSELS
Oil Pollution Monitoring in the Lagoon of Venice Using the Mussel Mytilus Galloprovincialis,
W74-11948 5C

MYTILUS GALLOPROVINCIALIS
Oil Pollution Monitoring in the Lagoon of Venice Using the Mussel Mytilus Galloprovincialis,
W74-11948 5C

NA+-K+-ATPASE
The In Vivo Effect of P,P' DDT on Na+-K+-Activated ATPase Activity in Rainbow Trout (Salmo Gairdneri),
W74-11485 5C

NAHANT BAY (MASSACHUSETTS)
Rapid Coastal Bottom Water Temperature Rises,
W74-11901 2L

NAMOI RIVER BASIN (AUST)
Urban-Rural Conflicts in Urban Water Supply,
W74-11694 6D

NATURAL GAS
Cost and Feasibility of Stimulating Tight Gas Reservoirs with Chemical Explosives,
W74-11663 8H

NEBRASKA
Aerial Radiological Measuring Survey of the Area Surrounding the Hallam Nuclear Power Favility, Hallam, Nebraska, September 20, 1968.
W74-11960 5B

NEPHROTOXICITY
Electron Microscopic Study of Cadmium Nephrotoxicity in the Rat,
W74-11719 5C

NETWORK DESIGN
The Criterion of Information Sufficiency with Automation of Hydrological Measurements,
W74-11561 7B

NETWORKS
Least Cost Design of Branched Pipe Network System,
W74-11647 8B

NEVADA
Estimating Flood Discharges in Nevada Using Channel-Geometry Measurements,
W74-11742 4A

NEW HAMPSHIRE
The Effect of Boat Waves on the Sedimentary Processes of a New England Tidal Flat,
W74-11973 2J

NEW JERSEY
Ocean County Sewerage Authority Waste Water Solids Utilization on Land Demonstration Project,
W74-11843 5D

NEW MEXICO
Management, Operation and Maintenance of Brackish Water Test Facility, Roswell, New Mexico, July 1970 - April 1972,
W74-11832 3A

Selected Hydrologic Data in the Upper Colorado River Basin,
W74-11979 7C

NEW YORK
Mercury in Striped Bass and Bluefish,
W74-11488 5A

Effect of Blackfly Larviciding in Some Adirondack Streams,
W74-11489 5C

Mercury Concentrations in Fish, Plankton, and Water from Three Western Atlantic Estuaries,
W74-11715 5A

New York State's View of Land Disposal,
W74-11846 5D

Population, Resources, and Pollution, and Their Impact on the Hudson Estuary,
W74-11870 5B

Trace Metals in New York State Fish,
W74-11934 5C

A Method for Integrating Surface and Ground Water Use in Humid Regions,
W74-11964 5F

NEW YORK HARBOR
Sediment and Waste Deposition in New York Harbor,
W74-11874 5B

NEW ZEALAND
Mass Stranding of Molluscs at Te Waewae Bay, Southland, New Zealand,
W74-11938 5C

NEWCASTLE (AUST)
An Opportunity Cost Function for Newcastle's Water,
W74-11689 6C

NICKEL
Aerosols of Lead, Nickel, and Cadmium,
W74-11716 5A

Recovery of Heavy Metals from Waste Acid (Haisan Kara No Jukinzoku No Kaishu),
W74-11879 5D

NITRATES
Selected Irrigation Return Flow Quality Abstracts 1972-1973, Third Annual Issue.
W74-11576 5G

Solvent Extraction of Nitrate from Titanium Leacher Effluent,
W74-11763 5D

NITROGEN
Constraints to Spreading Sewage Sludge on Cropland,
W74-11701 5D

Some Constraints of Spreading Sludge on Cropland,
W74-11838 5D

Surface Agitators as a Means to Reduce Nitrogen Gas in a Hatchery Water Supply,
W74-11936 5C

NITROGEN COMPOUNDS
Effect of Molybdenum Starvation and Tungsten on the Synthesis of Nitrogenase Components in Klebsiella pneumoniae,
W74-11713 5C

NITROUS OXIDE
The North Atlantic Ocean as a Source of Atmospheric N2O,
W74-11900 2K

NON-ISOTHERMAL FLOW
On a Possible Extension of Darcy's Law,
W74-11472 2F

NONLINEAR WAVE FORCES
Nonlinear Wave Forces on Halfcylinder and Hemisphere,
W74-11475 8B

NORTH CAROLINA
Environmental Statements and Water Resource Planning in North Carolina,
W74-11460 6G

Effects of Salt Marsh Impoundments on Mosquito Populations,
W74-11461 5C

Evaluation of 75,000 GPD Continuous Ion Exchange Sea Water Desulfating Pilot Plant,
W74-11629 3A

Fourth Report on Horizontal-Tube Multiple-Effect (HTME) Process Pilot Plant Test Program,
W74-11633 3A

Fifth Report on Horizontal-Tube Multiple Effect (HTME) Process Pilot Plant Test Program,
W74-11634 3A

Mercury Concentrations in Fish, Plankton, and Water from Three Western Atlantic Estuaries,
W74-11715 5A

Movement and Dispersion of Soluble Materials in Salem Creek, Muddy Creek and Yadkin River Between Winston-Salem and Salisbury, North Carolina,
W74-11749 5B

The Effect of Heated Water on the Temperature and Evaporation of Hyco Lake, North Carolina, 1966-72,
W74-11751 5C

Analysis of Biological, Clinical, and Environmental Samples Using Proton-Induced X-Ray Emission,
W74-11862 5A

NORTHEAST U.S.
Groundwater Contamination in the Northeast States,
W74-11806 5B

NOTROPIS VENUSTUS
Environmental Evaluation Based on Relative Growth Rates of Fishes,
W74-11937 5C

NUCLEAR ENERGY
The Present and Future Situation of Nuclear Energy Production and its Associated Industry--Normal Operation, Accident Prevention and Mitigation, Comparative Risk Assessment,
W74-11953 5C

NUCLEAR EXPLOSIONS
Cost and Feasibility of Stimulating Tight Gas Reservoirs with Chemical Explosives,
W74-11663 8H

Current Problems in the Radioecology of Soils and Plants,
W74-11666 5B

Reports Available in Plowshare Open File.
W74-11671 5B

NUCLEAR POWERPLANT
Chlorination Experiments at the John E. Amos Plant of the Appalachian Power Company: April 9-10, 1973,
W74-11676 5A

NUCLEAR POWERPLANTS
Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

Use of Rivers to Predict Accumulation in Sediment of Radio-nuclides Discharged from Nuclear Power Stations,
W74-11654 5B

Nuclear Power and Public Opinion,
W74-11656 5G

The Occurrence and Retention of Radionuclides in the Sediments of White Oak Lake,
W74-11665 5B

Current Problems in the Radioecology of Soils and Plants,
W74-11666 5B

Final Environmental Statement Related to the Proposed Comanche Peak Steam Electric Station Units 1 and 2.
W74-11674 5B

Final Environmental Statement Related to the Proposed Summit Power Station Units 1 and 2 - Delmarva Power and Light Company.
W74-11675 5B

The Present and Future Situation of Nuclear Energy Production and its Associated Industry--Normal Operation, Accident Prevention and Mitigation, Comparative Risk Assessment,
W74-11953 5C

Environmental Monitoring at the Pacific Northwest Laboratory by Battelle-Northwest,
W74-11956 5B

Assessing Potential Radiological Impacts to Aquatic Biota in Response to the National Environmental Policy Act (NEPA) of 1969,
W74-11957 5C

Problems of Radioecology in Connection with the Development of Nuclear Power,
W74-11958 5B

Aerial Radiological Measuring Survey of the Area Surrounding the Hallam Nuclear Power Favility, Hallam, Nebraska, September 20, 1968.
W74-11960 5B

NUCLEAR REACTORS
The Present and Future Situation of Nuclear Energy Production and its Associated Industry--Normal Operation, Accident Prevention and Mitigation, Comparative Risk Assessment,
W74-11953 5C

NUCLEAR WASTES
Disposal of Solid Radioactive Wastes in Bedded Salt Deposits.
W74-11657 5E

The Present and Future Situation of Nuclear Energy Production and its Associated Industry--Normal Operation, Accident Prevention and Mitigation, Comparative Risk Assessment,
W74-11953 5C

NUMERICAL ANALYSIS
Surface-Wave Transport in Nonuniform Canals,
W74-11968 8B

NUTRIENT LOADING
Nutrient Loading from a Separate Storm Sewer in Madison, Wisconsin,
W74-11853 5B

NUTRIENT REMOVAL
Anaerobic-Aerobic Lagoon Treatment of Dairy Manure Wastes,
W74-11804 5D

NUTRIENT REQUIREMENTS
Some Nutritional Characteristics of Spirulina maxima Algae Grown in Effluents from Biological Treatment Plant,
W74-11872 5C

NUTRIENTS
Fate of Materials Applied,
W74-11848 5B

OCEAN CIRCULATION
Eastern Intensification of Ocean Spin-Down: Application to El Nino,
W74-11894 2E

OCEAN COUNTY (NJ)
Ocean County Sewerage Authority Waste Water Solids Utilization on Land Demonstration Project,
W74-11843 5D

OCEAN CURRENTS
Eastern Intensification of Ocean Spin-Down: Application to El Nino,
W74-11894 2E

OCEAN SPIN-DOWN
Eastern Intensification of Ocean Spin-Down: Application to El Nino,
W74-11894 2E

OCEAN WAVES
Wave Transmission through Porous Structures,
W74-11474 8B

Nonlinear Wave Forces on Halfcylinder and Hemisphere,
W74-11475 8B

OCEANS
Longshore Currents and the Onset of Upwelling Over Bottom Slope,
W74-11896 2L

The North Atlantic Ocean as a Source of Atmospheric N2O,
W74-11900 2K

Carbon Monoxide in the South Pacific Ocean,
W74-11904 2K

A Bibliography on Ocean Waste Disposal.
W74-11985 5E

OFFSHORE STRUCTURES
Nonlinear Wave Forces on Halfcylinder and Hemisphere,
W74-11475 8B

OGALLALA AQUIFER (CO)
Digital Model of the Ogallala Aquifer of the Northern Part of the Northern High Plains of Colorado,
W74-11741 2F

OHIO RIVER
Flood Plain Information, Ohio River: Ohio County, West Virginia.
W74-11677 4A

OIL
Some Observations on the Interactions of Marine Protozoa and Crude Oil Residues,
W74-11949 5C

OIL POLLUTION
Control and Confinement of Oil Pollution on Water with Monomolecular Surface Films,
W74-11781 5G

Oil Pollution Monitoring in the Lagoon of Venice Using the Mussel Mytilus Galloprovincialis,
W74-11948 5C

OIL SPILL CLEANUP
Control and Confinement of Oil Pollution on Water with Monomolecular Surface Films,
W74-11781 5G

OIL SPILLS
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W74-11725 5B

Control and Confinement of Oil Pollution on Water with Monomolecular Surface Films,
W74-11781 5G

Biodegradation of Oil in Sea Water for Naval Pollution Control,
W74-11976 5G

OILY WATER
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W74-11725 5B

OKLAHOMA
Flood Characteristics of Oklahoma Streams,
W74-11965 2E

An Approach to Estimating Flood Frequency for Urban Areas in Oklahoma,
W74-11998 4A

ON-SITE DATA COLLECTIONS
Soil-Water Regimes in Brookston and Crosby Soils,
W74-11899 2G

ONCHORYNCHUS SSP
Effects of Hydroelectric Development in Western Canada on Aquatic Ecosystems,
W74-11944 5C

ONSITE TESTS
Field Testing of Improved Ion Exchange Techniques,
W74-11826 3A

Sludge Disposal Studies at Beltsville,
W74-11841 5D

OPEN CHANNEL FLOW
Hydraulics of Main Channel-Floodplain Flows,
W74-11462 8B

The Intense Evaluation of Discharge Measurements by the Equations of the Universal Velocity Distribution Law,
W74-11567 2E

Studies on Runoff Characteristics in Channel Network Systems in Low Land,
W74-11865 2A

Free Surface Slopes at Controls in Channel Flow,
W74-11888 8B

Surface-Wave Transport in Nonuniform Canals,
W74-11968 8B

Investigation of Diffusion in Open-Channel Flows,
W74-11972 2E

OPERATIONS
Management, Operation and Maintenance of Brackish Water Test Facility, Roswell, New Mexico, July 1970 - April 1972,
W74-11832 3A

OPPORTUNITY COSTS
An Opportunity Cost Function for Newcastle's Water,
W74-11689 6C

OPTIMAL DEVELOPMENT PLANS
Application of Statistical Techniques to the Selection of an Optimal Pollution Treatment Program,
W74-11570 5D

OPTIMIZATION
Metropolitan Water Intelligence Systems--Completion Report, Phase III,
W74-11457 5D

OPTIMUM DEVELOPMENT PLANS
Planning and Analysis of Metropolitan Water Resource Systems,
W74-11451 6A

ORANGE COUNTY (CA)
Development Program and Test Instrumentation for VTE/MSF Module Plant, Fountain Valley, California.
W74-11635 3A

OREGON
Oregon's Estuaries: Description and Information Sources for Oregon's Estuaries,
W74-11575 2L

Nuclear Power and Public Opinion,
W74-11656 5G

Mercury Content of Oregon Groundfish,
W74-11717 5A

The Length of Residence of Juvenile Fall Chinook Salmon in Sixes River, Oregon,
W74-11788 8I

ORGANIC COMPOUNDS
Alkanes and Alkenes in Marine Benthic Algae,
W74-11951 5C

ORGANIC MATTER
A Mathematical Model of Transport, Diffusion and Degradation of Organic Matter in a River,
W74-11875 5G

Graphite Braid Atomizer for Atomic Absorption and Atomic Fluorescence Spectrometry,
W74-11912 5A

ORGANIC MICROPOLLUTANTS
Investigation of Volatile Organic Micropollutants in Air and Water Using Low-Temperature Capillary GC-MS,
W74-11863 5A

ORGANOPHOSPHATE PESTICIDES
Short-Term Effects of Organophosphate Pesticides on Cholinesterases of Estuarine Fishes and Pink Shrimp,
W74-11486 5C

ORGANOPHOSPHOROUS COMPOUNDS
Short-Term Effects of Organophosphate Pesticides on Cholinesterases of Estuarine Fishes and Pink Shrimp,
W74-11486 5C

ORGANOPHOSPHORUS COMPOUNDS
Lethality and Behavioral Symptoms Produced by Some Organophosphorous Compounds in the Snail (Helix Aspersa),
W74-11483 5C

ORGANOPHOSPHORUS PESTICIDES
Pesticide Movement from Cropland into Lake Erie,
W74-11922 5B

OSCILLATING FLOW
Do-Sag in Oscillating Flow,
W74-11897 5B

OSMOSIS
Effects of Copper and Cadmium on Osmoregulation and Oxygen Consumption in Two Species of Estuarine Crabs,
W74-11491 5C

OTTAWA
The Use of Radar in Urban Hydrology,
W74-11468 2E

OVERFLOW
Metropolitan Water Intelligence Systems--Completion Report, Phase III,
W74-11457 5D

OVERLAND FLOW
A Recording Meter for Measuring the Overland Flow,
W74-11530 7B

Experiences With Land Spreading of Municipal Effluents,
W74-11850 5D

Nationwide Experiences in Land Treatment,
W74-11851 5D

OVERLAND FLOW SYSTEMS
Land Application of Sewage Effluents and Sludges: Selected Abstracts,
W74-11577 5D

OXIDATION
Studies of Oxygen Reduction at a Rotating Disk Electrode,
W74-11641 3A

OXIDATION LAGOONS
A Waste Treatment System for Confined Hog Raising Operations,
W74-11792 5D

OXYGEN
Effects of Copper and Cadmium on Osmoregulation and Oxygen Consumption in Two Species of Estuarine Crabs,
W74-11491 5C

Jet Aerator has High Oxygenation Capacity.
W74-11858 5D

Summertime Artificial Aeration Increases Winter Oxygen Levels in a Michigan Lake,
W74-11939 5C

OXYGEN ACTIVATED SLUDGE
Activated Sludge Process Using Pure Oxygen,
W74-11799 5D

OXYGEN ISOTOPES
Deuterium and Oxygen-18 Measurements on Surface Waters of the Bavarian Prealps,
W74-11550 2K

OXYGEN REQUIREMENTS
Activated Sludge Process Using Pure Oxygen,
W74-11799 5D

OXYGEN SAG
Do-Sag in Oscillating Flow,
W74-11897 5B

OXYGENATION
Activated Sludge Process Using Pure Oxygen,
W74-11799 5D

OYSTERS
Accumulation and Depuration of Mercury in the American Oyster Crassostrea Virginica,
W74-11490 5C

PACKINGHOUSE WASTES
Treatment of Packinghouse Wastes by Anaerobic Lagoons and Plastic-Media Filters,
W74-11797 5D

PALM BEACH COUNTY (FL)
Encroaching Salt Water in Northeast Palm Beach County, Florida,
W74-11779 7C

PARTIAL WELL PENETRATION
Method of Additional Seepage Resistances--Theory and Application,
W74-11479 4B

PARTICLE SIZE
Statistical Parameters of Distribution of Granulation Indicating Suspended Sediment and Bed Sediment,
W74-11542 2J

PATH OF POLLUTANTS
Observations on the Distribution of Chlorinated Hydrocarbons in Atlantic Ocean Organisms,
W74-11484 5B

A Multisource Atmospheric Transport Model for Deposition of Trace Contaminants,
W74-11651 5B

Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

Ecological-Environmental Assessments Related to the Federal Repository,
W74-11672 5B

Aspects of the Distribution and Trace Element Composition of Suspended Matter in the Black Sea,
W74-11709 5B

Toxicity for Cats of Methylmercury in Contaminated Fish from Swedish Lakes and of Methyl-Mercury Hydroxide Added to Fish,
W74-11711 5C

Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W74-11725 5B

Surface Jet Stream Excess Temperature Analysis,
W74-11748 5B

Movement and Dispersion of Soluble Materials in Salem Creek, Muddy Creek and Yadkin River Between Winston-Salem and Salisbury, North Carolina,

Feasibility of Digital Water-Quality Modeling Illustrated by Application at Barstow, California,
W74-11750 5B

A Model of Circulation and Dispersion in Pearl Harbor,
W74-11769 5B

Herbicide Runoff from Four Coastal Plain Soil Types,
W74-11805 5B

Fate of Materials Applied,
W74-11848 5B

Sediment and Waste Deposition in New York Harbor,
W74-11874 5B

A Mathematical Model of Transport, Diffusion and Degradation of Organic Matter in a River,
W74-11875 5G

Cadmium - A Trace Element of Concern in Mining and Manufacturing,
W74-11919 5B

Pesticide Transport and Runoff Model for Agricultural Lands,
W74-11920 5B

Pesticide Movement from Cropland into Lake Erie,
W74-11922 5B

Ratio of CS-137 -- SR-90 in Ocean and Sea Water,
W74-11959 5B

Effects of Septic Tank Effluent on Groundwater Quality, Dade County, Florida: An Interim Report,
W74-11975 5B

Documentation for SNSIM1/2, a Computer Program for the Steady-State Water Quality Simulation of a Stream Network,
W74-11978 5B

PAUNCH MANURE
Paunch Manure as a Feed Supplement in Channel Catfish Farming,
W74-11796 5C

PEAK DISCHARGE
Estimating Flood Discharges in Nevada Using Channel-Geometry Measurements,
W74-11742 4A

PEARL HARBOR (HAWAII)
A Model of Circulation and Dispersion in Pearl Harbor,
W74-11769 5B

PENICILLIUM NOTATUM
Uptake of Mercuric Chloride and Methylmercury Chloride from Liquid Media by Aspergillus niger and Penicillium notatum,
W74-11877 5C

PENNSYLVANIA
Unit Hydrographs for Catchments of Different Sizes and Dissimilar Regions,
W74-11466 2A

Hydrologic Impact of Tropical Storm Agnes,
W74-11892 2B

PERCOLATION
A Modified Horton Equation for Infiltration During Intermittent Rainfall,
W74-11907 2G

Soil Systems For Municipal Effluents - A Workshop and Selected References,
W74-11924 5D

PERFORMANCE
Analysis of Existing Data from the San Diego Test Facility, Phase II Final Report,
W74-11638 3A

Annual Report - Vertical Tube Evaporator Multistage Flash Test Bed Plant, Freeport, Texas, March 19, 1971 to March 31, 1972.
W74-11807 3A

PERMAFROST
Hydrogeology of the USSR. Volume 26. Soviet North East (Gidrogeologiya SSSR. Tom XXVI. Severo-Vostok).
W74-11455 4B

PERMEABILITY
Development of Sea Water Membranes, Part I,
W74-11643 3A

PERMSELECTIVE MEMBRANES
Research on Advanced Membranes for Reverse Osmosis,
W74-11642 3A

PESTICIDE DRIFT
Pesticide Transport and Runoff Model for Agricultural Lands,
W74-11920 5B

PESTICIDE MOVEMENT
Herbicide Runoff from Four Coastal Plain Soil Types,
W74-11805 5B

PESTICIDE RESIDUES
Pesticide Movement from Cropland into Lake Erie,
W74-11922 5B

Microbial Degradation of DDT,
W74-11992 5B

PESTICIDE TRANSPORT
Pesticide Transport and Runoff Model for Agricultural Lands,
W74-11920 5B

PESTICIDES
Water Quality Implications of Pesticides,
W74-11608 6G

Effect of Rate and Duration of Feeding DDT on the Reproduction of Salmonid Fishes Reared and Held Under Controlled Conditions,
W74-11933 5C

Factors Influencing Formalin Toxicity in Trout,
W74-11947 5C

PHEROMONES (ALARM)
Trail-Marking and Alarm Pheromones of Some Ants of the Genus Atta,
W74-11802 5A

PHEROMONES (TRAIL-MARKING)
Trail-Marking and Alarm Pheromones of Some Ants of the Genus Atta,
W74-11802 5A

PHOSPHATES
Selected Irrigation Return Flow Quality Abstracts 1972-1973, Third Annual Issue.
W74-11576 5G

PHOSPHOROUS REMOVAL
Phosphorus Removal by an Activated Sludge Plant.
W74-11927 5D

PHOSPHORUS REMOVAL
Phosphorus Removal and Disposal from Municipal Waste Water.
W74-11928 5D

PHOSPHORUS REMOVAL STRATEGIES
A Computer Model For Evaluating Community Phosphorus Removal Strategies,
W74-11931 5D

PHOTOMETRY
Experiences with Photometric Turbidity Measurements,
W74-11540 7B

PHYCHOLOGICAL ASPECTS
Nuclear Power and Public Opinion,
W74-11656 5G

PHYTOPLANKTON
Long-Term Changes in the Plankton of Eutrophic Mikolajskie Lake as an Effect of Accelerated Eutrophication,
W74-11482 5C

PILES (FOUNDATIONS)
Radiation and Scattering of Water Waves by Rigid Bodies: Part 2. Vertical Cylinders of Circular Cross-Section,
W74-11787 8B

PILOT PLANTS
Evaluation of 75,000 GPD Continuous Ion Exchange Sea Water Desulfating Pilot Plant,
W74-11629 3A

Operation of the 16-Stage MSF Pilot Plant--1969-1970,
W74-11631 3A

Fourth Report on Horizontal-Tube Multiple-Effect (HTME) Process Pilot Plant Test Program,
W74-11633 3A

Fifth Report on Horizontal-Tube Multiple Effect (HTME) Process Pilot Plant Test Program,
W74-11634 3A

Field Testing of Improved Ion Exchange Techniques,
W74-11826 3A

Ocean County Sewerage Authority Waste Water Solids Utilization on Land Demonstration Project,
W74-11843 5D

Treatment of Waste Water from the Production of Polyhydric Organics.
W74-11926 5D

PINK SHRIMP
Short-Term Effects of Organophosphate Pesticides on Cholinesterases of Estuarine Fishes and Pink Shrimp,
W74-11486 5C

PIPE FLOW
Free Surface Subcritical Flow Measurement,
W74-11520 7B

Least Cost Design of Branched Pipe Network System,
W74-11647 8B

PLANNING
Environmental Statements and Water Resource Planning in North Carolina,
W74-11460 6G

Proceedings: Planning and Design for Urban Runoff and Sediment Management.
W74-11678 4D

Proceedings of the Urban Water Economics Symposium.
W74-11682 6B

Models for Allocation of Water Resources,
W74-11696 6A

PLANT PHYSIOLOGY
Physiological Characteristics of Nepeta transcaucasica Grossh. Under Irrigated Conditions,
W74-11649 2G

PLAYAS
Dynamics of Playa Lakes in the Texas High Plains,
W74-11774 7B

PLOWSHARE
Reports Available in Plowshare Open File.
W74-11671 5B

POLAROGRAPHIC ANALYSIS
The Trace Analysis of Water for Selected Metallic Elements Employing Square-Wave Polarography,
W74-11679 5A

Polarographic Determination of 8-Hydroxyquinolinates After Extraction with Naphthalene. Trace Analysis of Cadmium and Lead,
W74-11876 5A

POLLUTANT IDENTIFICATION
Mercury in Striped Bass and Bluefish,
W74-11488 5A

Simplified Atomic Absorption Determination of Stable Strontium in Milk and Hay: A Comparison of Methods and Stepwise Procedure,
W74-11652 5A

Chlorination Experiments at the John E. Amos Plant of the Appalachian Power Company: April 9-10, 1973,
W74-11676 5A

The Trace Analysis of Water for Selected Metallic Elements Employing Square-Wave Polarography,
W74-11679 5A

Atomic Absorption Determination of Elemental Mercury Collected from Ambient Air on Silver Wool,
W74-11705 5A

Mercury Concentrations in Fish, Plankton, and Water from Three Western Atlantic Estuaries,
W74-11715 5A

Aerosols of Lead, Nickel, and Cadmium,
W74-11716 5A

Mercury Content of Oregon Groundfish,
W74-11717 5A

Whole-Body and Hair Retention of Cadmium in Mice, Including an Autoradiographic Study on Organ Distribution,
W74-11718 5C

Consecutive Titration of Calcium and Magnesium in Ethanol-Water Mixture,
W74-11721 2K

U.S. Geological Survey Water Quality Program, Indiana District,
W74-11734 5A

Wastewater Sampling and Testing Instrumentation,
W74-11754 5A

Analysis of Coprostanol, an Indicator of Fecal Contamination,
W74-11794 5A

Investigation of Volatile Organic Micropollutants in Air and Water Using Low-Temperature Capillary GC-MS,
W74-11863 5A

New Global Watch for Pollution Effects.
W74-11866 5A

Polarographic Determination of 8-Hydroxyquinolinates After Extraction with Naphthalene. Trace Analysis of Cadmium and Lead,
W74-11876 5A

Spectrophotometric Determination of Copper and Iron Subsequent to the Simultaneous Ex-

traction of BIS(2,9-Dimethyl-1, 10-Penanthroline) Copper (I) and BIS (2,4,6-TRI(2-Pyridyl)-1, 3, 5-Triazine) Iron (II) into Propylene Carbonate,
W74-11910 5A

Selective Separation and Concentration of Silver Via Precipitation Chromatography,
W74-11911 5A

Graphite Braid Atomizer for Atomic Absorption and Atomic Fluorescence Spectrometry,
W74-11912 5A

Preliminary Studies of the Shock Tube as an Excitation Source for the Analysis of Selected Trace Metals in Aqueous Media,
W74-11913 5A

Availability of Data on Surface-Water Quantity and Quality for the San Francisco Bay Region, California, with a Summary of Beneficial Uses and Implications for Land Use,
W74-11980 7C

POLLUTION ABATEMENT
Control and Confinement of Oil Pollution on Water with Monomolecular Surface Films,
W74-11781 5G

Granite Industry Wastewater Treatment,
W74-11790 5D

POLYCHLORINATED BIPHENYLS
Observations on the Distribution of Chlorinated Hydrocarbons in Atlantic Ocean Organisms,
W74-11484 5B

POLYMERS
Viscous Drag Reduction in Developing Pipe Flow,
W74-11755 8B

Drag Reduction by Polymer Addition,
W74-11780 8B

POLYOXYETHYLATED SURFACTANT
Lethal Response by Atlantic Salmon Parr. to Some Polyoxyethylated Cationic and Nonionic Surfactants,
W74-11481 5C

PONDING
Air and Water Flow During Ponded Infiltration in a Vertical Bounded Column of Soil,
W74-11467 2G

PONDS
The Distribution of Carex bohemica Schreb. in the Central Belt of the European Part of the USSR, (In Russian),
W74-11873 2H

POROUS MEDIA
Wave Transmission through Porous Structures,
W74-11474 8B

POULTRY PROCESSING INDUSTRY
Water and Waste Management in Poultry Processing,
W74-11789 5D

POWER PLANTS
The Estuary and Industrial Wastes: Power Plants,
W74-11869 5D

PRECIPITATION GAUGES
Evaporation Losses from Containers of Hellmann Precipitation Gauges,
W74-11909 2B

PRECIPITATION INTENSITY
Rainfall Intensities in the Conterminous United States and Hawaii (Supplement 1 to ETL-SR-72-5: Distribution of Mean Monthly Precipitation and Rainfall Intensities),
W74-11747 2B

PRESSURE-VOLUME RELATIONSHIP (SANDSTONE)
High-Pressure Mechanical Properties of Kayenta Sandstone,
W74-11662 8E

PRESSURIZED WATER REACTORS
Final Environmental Statement Related to the Proposed Comanche Peak Steam Electric Station Units 1 and 2.
W74-11674 5B

PRETREATMENT (WATER)
Development of Sea Water Membranes, Part II,
W74-11644 3A

PRICING
Proceedings of the Urban Water Economics Symposium.
W74-11682 6B

Payment by Use in Urban Water Supply,
W74-11683 6C

An Opportunity Cost Function for Newcastle's Water,
W74-11689 6C

A Method for Analysis of Residential Water Demand and Its Relation to Management,
W74-11695 6B

A New Direction for Urban Investment and Pricing Decisions,
W74-11697 6B

PRODUCTIVITY
Ecological Impact of the In-line Arrangement of Two Reservoirs and a Metropolitan Area,
W74-11571 5C

PROJECT FEASIBILITY
Survey of Economic-Ecologic Impacts of Small Watershed Development,
W74-11680 6B

PROJECT IMPACT
Broader Evaluation Considerations,
W74-11627 6B

PROJECT IMPACT ANALYSIS
Alternative Taxonomical Constructs,
W74-11588 6B

PROJECT PLANNING
Ames Reservoir Environmental Study. Appendix 2. Economic and Social Impact,
W74-11586 6B

Evaluation of Water Resources Development Projects: The State-Of-The-Art and Emerging Directives,
W74-11587 6B

Alternative Land and Water Management Programs,
W74-11613 6B

Project Impact Evaluation,
W74-11624 6B

PROJECT POST-EVALUATION
Anticipated Post-Construction Impact,
W74-11594 6B

PROJECTIONS
Population Projections for Ames and the Reservoir Area of Influence,
W74-11615 6B

Future Water Supply Requirements and Alternative Sources of Supply at Ames,
W74-11617 6B

Waste Water Treatment Needs for Ames,
W74-11620 6B

Modeling Radiation Exposure to Populations from Radioactivity Released to the Environment,
W74-11655 5B

Projections of Radioactive Wastes to be Generated by the U.S. Nuclear Power Industry,
W74-11962 5G

PROJECTS
Environmental Research Publications, January 1971-July 1973.
W74-11746 5G

PROTEINS
Protein Production from Acid Whey Via Fermentation,
W74-11795 5D

Some Nutritional Characteristics of Spirulina maxima Algae Grown in Effluents from Biological Treatment Plant,
W74-11872 5C

PROTON-INDUCED X-RAYS
Analysis of Biological, Clinical, and Environmental Samples Using Proton-Induced X-Ray Emission,
W74-11862 5A

PROTOZOA
Some Observations on the Interactions of Marine Protozoa and Crude Oil Residues,
W74-11949 5C

PROVENANCE
Sediments of the East Atlantic Continental Margin--A Preliminary Report,
W74-11739 2L

PSYCHOLOGICAL ASPECTS
People and the Reservoir,
W74-11591 6B

PUBLIC HEALTH
Health Hazards of Lead.
W74-11706 5C

Standards for the Prevention of Occupational Lead Poisoning,
W74-11714 5C

Protection of the Public Health,
W74-11849 5D

Mercury Concentrations in Tissues of Fish from the Connecticut River,
W74-11917 5B

PUBLIC OPINION
Nuclear Power and Public Opinion,
W74-11656 5G

Public Use and Evaluation of Reclaimed Water,
W74-11878 5D

PUBLICATIONS
A Survey of Papers on Ecosystems Analysis from 1947-1971 in the Journal 'Ecology',
W74-11668 5B

PUBLICATIONS

Reports Available in Plowshare Open File.
W74-11671 5B

PULP AND PAPER INDUSTRY
Color Removal and Sludge Disposal Process for Kraft Mill Effluents,
W74-11803 5D

PUMP DESIGN
Low Energy Mechanical Methods of Reservoir Destratification,
W74-11572 4A

PUMPING
Low Energy Mechanical Methods of Reservoir Destratification,
W74-11572 4A

RADAR
The Use of Radar in Urban Hydrology,
W74-11468 2E

Ultrasonic Measurement of Discharge in Rivers,
W74-11528 7B

RADIATION
Environmental Monitoring Report, Period Covering May 1, 1973 Through July 31, 1973 for El Paso Natural Gas Company.
W74-11954 5B

RADIOACTIVE TRACERS
Hydrologic Investigations of the Groundwaters of Central Texas Using U-234/U-238 Disequilibrium,
W74-11465 2F

RADIOACTIVE WASTE DISPOSAL
Disposal of Solid Radioactive Wastes in Bedded Salt Deposits.
W74-11657 5E

Control and Treatment of Radioactive Liquid Waste Effluents at the Savannah River Plant,
W74-11661 5D

Deep Self-Burial of Radioactive Wastes by Rock-Melting Capsules,
W74-11664 5E

The Occurrence and Retention of Radionuclides in the Sediments of White Oak Lake,
W74-11665 5B

Ecological-Environmental Assessments Related to the Federal Repository,
W74-11672 5B

Tritium Control Technology,
W74-11673 5D

Projections of Radioactive Wastes to be Generated by the U.S. Nuclear Power Industry,
W74-11962 5G

RADIOACTIVITY
Simplified Atomic Absorption Determination of Stable Strontium in Milk and Hay: A Comparison of Methods and Stepwise Procedure,
W74-11652 5A

Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

Use of Rivers to Predict Accumulation in Sediment of Radio-nuclides Discharged from Nuclear Power Stations,
W74-11654 5B

Modeling Radiation Exposure to Populations from Radioactivity Released to the Environment,
W74-11655 5B

Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1972.
W74-11658 5B

Environmental Monitoring Report - United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1971.
W74-11659 5B

Environmental Levels of Radioactivity in the Vicinity of the Lawrence Livermore Laboratory - 1973 Annual Report,
W74-11660 5B

Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1973.
W74-11667 5B

Theoretical Experimental and Field Studies Concerning Reactions of Radioisotopes with Sediments and Suspended Particles of the Sea. Part C: Applications to Field Studies,
W74-11670 5B

Reports Available in Plowshare Open File.
W74-11671 5B

Tritium Control Technology,
W74-11673 5D

Environmental Control in Nuclear Fuel Reprocessing,
W74-11955 5B

Environmental Monitoring at the Pacific Northwest Laboratory by Battelle-Northwest,
W74-11956 5B

Assessing Potential Radiological Impacts to Aquatic Biota in Response to the National Environmental Policy Act (NEPA) of 1969,
W74-11957 5C

Aerial Radiological Measuring Survey of the Area Surrounding the Hallam Nuclear Power Favility, Hallam, Nebraska, September 20, 1968.
W74-11960 5B

RADIOACTIVITY EFFECTS
Nuclear Power and Public Opinion,
W74-11656 5G

RADIOECOLOGY
Current Problems in the Radioecology of Soils and Plants,
W74-11666 5B

RADIOISOTOPES
Theoretical Experimental and Field Studies Concerning Reactions of Radioisotopes with Sediments and Suspended Particles of the Sea. Part C: Applications to Field Studies,
W74-11670 5B

Environmental Monitoring Report, Period Covering May 1, 1973 Through July 31, 1973 for El Paso Natural Gas Company.
W74-11954 5B

Ratio of CS-137 -- SR-90 in Ocean and Sea Water,
W74-11959 5B

RADIOMETERS
Temperature Measurements of Water Surfaces Using Infra-Red Radiation Thermometers,
W74-11552 7B

RAIN RETENTION BASINS
Rain Retention Basins and Rainwater Discharges (Regenbecken Und Regenentlastungen),
W74-11854 5D

RAINBOW TROUT
The In Vivo Effect of P,P' DDT on Na+-K+-Activated ATPase Activity in Rainbow Trout (Salmo Gairdneri),
W74-11485 5C

Effects of Water Reuse on Rainbow Trout in Hatcheries,
W74-11940 5C

Effects of Hatchery Water Reuse on Rainbow Trout Metabolism,
W74-11943 5C

Factors Influencing Formalin Toxicity in Trout,
W74-11947 5C

RAINFALL DISPOSITION
A Contribution to Statistical Depth-Duration-Frequency Analysis,
W74-11469 2B

RAINFALL INTENSITY
Rainfall Intensities in the Conterminous United States and Hawaii (Supplement 1 to ETL-SR-72-5: Distribution of Mean Monthly Precipitation and Rainfall Intensities),
W74-11747 2B

RAINFALL-RUNOFF RELATIONSHIPS
Unit Hydrographs for Catchments of Different Sizes and Dissimilar Regions,
W74-11466 2A

Variable Unit Hydrograph,
W74-11471 2A

Hydrologic Data for Little Pond Creek and North Elm Creek, Brazos River Basin, Texas, 1972,
W74-11733 2E

Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1972,
W74-11737 2F

Nutrient Loading from a Separate Storm Sewer in Madison, Wisconsin,
W74-11853 5B

RAINWATER
Rain Retention Basins and Rainwater Discharges (Regenbecken Und Regenentlastungen),
W74-11854 5D

RAINWATER DISCHARGES
Rain Retention Basins and Rainwater Discharges (Regenbecken Und Regenentlastungen),
W74-11854 5D

RATHDRUM PRAIRIE (ID)
Groundwater Occurrence and Movement in the Athol Area and the Northern Rathdrum Prairie, Northern Idaho,
W74-11730 2F

RECLAIMED WATER
Public Use and Evaluation of Reclaimed Water,
W74-11878 5D

RECREATION
Ames Reservoir Environmental Study. Appendix 3. Outdoor Recreation and Open Space.

W74-11774 7B

SAVANNAH RIVER (SC)
Control and Treatment of Radioactive Liquid Waste Effluents at the Savannah River Plant,
W74-11661 5D

SCALING
Operation of the 16-Stage MSF Pilot Plant--1969-1970,
W74-11631 3A

SCOTCH PINES
The Effect of Inorganic Nutrients on Water Economy and Hardiness of Conifers: I. The Effect of Varying Potassium, Calcium and Magnesium Levels on Water Content, Transpiration Rate and the Initial Phase of Development of Frost Hardiness of Pinus silvestris L. Seedlings,
W74-11648 2D

SCOUR
Gauging Stations on Sediment-Loaded Mountain Rivers,
W74-11522 7B

Flow Measurement of Low-Gradient Streams in Sandy Soils,
W74-11523 7B

SCYLLA SERRATA
Salinity and Temperature Tolerance of Zoeae of the Portunid Crab Scylla Serrata,
W74-11950 5C

SEA ICE
Application of Thermal Imagery to the Development of a Great Lakes Ice Information System,
W74-11784 7B

SEA STARS
Response of Asterias Vulgaris to Chemical Stimuli,
W74-11952 5C

SEA WATER
Development of Sea Water Membranes, Part I,
W74-11643 3A

Development of Sea Water Membranes, Part II,
W74-11644 3A

SECONDARY RECOVERY (OIL)
Cost and Feasibility of Stimulating Tight Gas Reservoirs with Chemical Explosives,
W74-11663 8H

Reports Available in Plowshare Open File.
W74-11671 5B

SEDIMENT CONTROL
Proceedings: Planning and Design for Urban Runoff and Sediment Management.
W74-11678 4D

SEDIMENT DISCHARGE
Suspended-Sediment Load of Texas Streams, Compilation Report October 1965-September 1971,
W74-11991 2J

SEDIMENT LOAD
Sediment and Waste Deposition in New York Harbor,
W74-11874 5B

SEDIMENT TRANSPORT
Field Studies of Sediment Movement Using Fluorescent Tracers,
W74-11544 2J

Sediment Transport Due to Oscillatory Waves,
W74-11731 2L

Pesticide Transport and Runoff Model for Agricultural Lands,
W74-11920 5B

SEDIMENT TRAPS
A Method for Measuring the Quality of Bedload Transported by Short Flood Waves,
W74-11541 7B

SEDIMENT YIELD
RESERVOIR Sedimentation,
W74-11610 6B

Erosion Processes, Fluvial Sediment Transport and Reservoir Sedimentation in a Part of the Newell and Zayante Creek Basins, Santa Cruz County, California,
W74-11758 2J

SEDIMENTATION
Theoretical Experimental and Field Studies Concerning Reactions of Radioisotopes with Sediments and Suspended Particles of the Sea. Part C: Applications to Field Studies,
W74-11670 5B

Sediments of the East Atlantic Continental Margin--A Preliminary Report,
W74-11739 2L

Erosion Processes, Fluvial Sediment Transport and Reservoir Sedimentation in a Part of the Newell and Zayante Creek Basins, Santa Cruz County, California,
W74-11758 2J

Streamflow, Sediment, and Turbidity in the Mad River Basin, Humboldt and Trinity Counties, California,
W74-11770 2E

Joint Construction Sediment Control Project,
W74-11923 4D

Remote Sensing Study of Land Use and Sedimentation in the Ross Barnett Reservoir, Jackson, Mississippi, Area,
W74-11963 4A

The Effect of Boat Waves on the Sedimentary Processes of a New England Tidal Flat,
W74-11973 2J

SEDIMENTS
Use of Rivers to Predict Accumulation in Sediment of Radio-nuclides Discharged from Nuclear Power Stations,
W74-11654 5B

Theoretical Experimental and Field Studies Concerning Reactions of Radioisotopes with Sediments and Suspended Particles of the Sea. Part C: Applications to Field Studies,
W74-11670 5B

Herbicide Runoff from Four Coastal Plain Soil Types,
W74-11805 5B

SEEPAGE
Method of Additional Seepage Resistances--Theory and Application,
W74-11479 4B

Seepage in Mississippi River Banks: Report 1, Analysis of Transient Seepage Using a Viscous-Flow Model and the Finite Difference and Finite Element Methods,
W74-11989 4A

SEEPAGE RESISTANCE
Method of Additional Seepage Resistances--Theory and Application,
W74-11479 4B

SEISMIC STUDIES
Application of Surface Geophysics to Groundwater Investigations,
W74-11996 4B

SEMIPERMEABLE MEMBRANES
Research and Development of Composite Membrane Technology,
W74-11825 3A

SEPARATED SEWERS
Nutrient Loading from a Separate Storm Sewer in Madison, Wisconsin,
W74-11853 5B

SEPARATION TECHNIQUES
Vortex Clarifier Achieves Fast Separations.
W74-11859 5D

Selective Separation and Concentration of Silver Via Precipitation Chromatography,
W74-11911 5A

SEPTIC TANKS
Groundwater Contamination in the Northeast States,
W74-11806 5B

Effects of Septic Tank Effluent on Groundwater Quality, Dade County, Florida: An Interim Report,
W74-11975 5B

SETTLING BASINS
A Waste Treatment System for Confined Hog Raising Operations,
W74-11792 5D

Rain Retention Basins and Rainwater Discharges (Regenbecken Und Regenentlastungen),
W74-11854 5D

SEWAGE SLUDGE
Constraints to Spreading Sewage Sludge on Cropland,
W74-11701 5D

Methods of Liquid Fertilizer Application,
W74-11839 5D

Equipment for Incorporating Sewage Sludge and Animal Manures Into the Soil,
W74-11840 5D

Sludge Disposal Studies at Beltsville,
W74-11841 5D

SEWAGE TREATMENT
Brandon Sewage Plant Features Novel Clarifier.
W74-11861 5D

Sewage Electrolysis,
W74-11871 5D

SEWER SYSTEMS
Rain Retention Basins and Rainwater Discharges (Regenbecken Und Regenentlastungen),

Hydraulic Model Study to Determine a Stage-Discharge Relationship,
W74-11531 2E

STANDARDS
Standards for the Prevention of Occupational Lead Poisoning,
W74-11714 5C

STATISTICAL METHODS
A Contribution to Statistical Depth-Duration-Frequency Analysis,
W74-11469 2B

Statistical Parameters of Distribution of Granulation Indicating Suspended Sediment and Bed Sediment,
W74-11542 2J

Application of Statistical Techniques to the Selection of an Optimal Pollution Treatment Program,
W74-11570 5D

The Use of Statistical Distributions for Determining the Magnitude and Frequency of Floods,
W74-11611 6A

Sampling Errors in Flood Damage Estimates,
W74-11690 6F

STATISTICAL MODELS
What Is, and What Is Not, a Markov Chain,
W74-11470 2A

The Effects of Total Dissolved Solids, Temperature, and pH on the Survival of Immature Striped Bass: A Response Surface Experiment,
W74-11935 5C

STATISTICS
A Note on the Relationship Between Size of Area and Soil Moisture Variability,
W74-11473 2G

Errors in Measurement of Flow by Velocity Area Methods,
W74-11560 7B

The Criterion of Information Sufficiency with Automation of Hydrological Measurements,
W74-11561 7B

STEAM CONDENSERS
An Investigation of the Variables Affecting Steam Condensation on the Outside of a Horizontal Tube Bundle,
W74-11639 3A

STORM RUNOFF
Metropolitan Water Intelligence Systems--Completion Report, Phase III,
W74-11457 5D

Character and Significance of Highway Runoff Waters--A Preliminary Appraisal,
W74-11775 4C

Studies on Modeling of Urban Storm Water Runoff--on the Relation Between the Composition of Basin Model and the Equivalent Roughness,
W74-11855 5B

An Approach to Estimating Flood Frequency for Urban Areas in Oklahoma,
W74-11998 4A

STORM WATER
Joint Construction Sediment Control Project,
W74-11923 4D

STORY COUNTY (IA)
Impact of Proposed Ames Reservoir on Story County Conservation Board Programs,
W74-11603 6B

STRAIN MEASUREMENTS
High-Pressure Mechanical Properties of Kayenta Sandstone,
W74-11662 8E

STRANDING
Mass Stranding of Molluscs at Te Waewae Bay, Southland, New Zealand,
W74-11938 5C

STRATIFICATION
Low Energy Mechanical Methods of Reservoir Destratification,
W74-11572 4A

Observations on Manganese in Georgia Waters,
W74-11712 5F

STRATIFIED FLOW
Hypolimnetic Flow Regimes in Lakes and Impoundments,
W74-11578 8B

STREAM GAGES
Symposium on Hydrometry, Volume I and II.
W74-11493 7B

Stream Gauging Network of the Lower Mekong Basin,
W74-11499 7B

Water-Level Gauging by Pressure Measuring,
W74-11500 7B

Instruments for Measurement of Currents and Levels in Natural Reservoirs and Rivers,
W74-11505 7B

Flow Measurement of Some of the World's Major Rivers by the Moving-Boat Method,
W74-11506 7B

Problems in the Design of Measuring Structures,
W74-11507 7B

Stream Gauging with Portable Equipment,
W74-11516 7B

Precision and Bias of the Results of Dilution Gaugings,
W74-11517 7B

Laboratory Calibration of the Walnut Gulch Supercritical Flow-Measuring Flume,
W74-11519 7B

Free Surface Subcritical Flow Measurement,
W74-11520 7B

Gauging Stations on Sediment-Loaded Mountain Rivers,
W74-11522 7B

Flow Measurement of Low-Gradient Streams in Sandy Soils,
W74-11523 7B

Measurement and Estimation of Flood Discharges,
W74-11524 7B

The Air-Bubble Method of Flow Measurement and Its Application,
W74-11525 7B

Ultrasonic Measurement of Discharge in Rivers,
W74-11528 7B

A Recording Meter for Measuring the Overland Flow,
W74-11530 7B

STREAMFLOW
Streamflow, Sediment, and Turbidity in the Mad River Basin, Humboldt and Trinity Counties, California,
W74-11770 2E

STREAMS
Use of Rivers to Predict Accumulation in Sediment of Radio-nuclides Discharged from Nuclear Power Stations,
W74-11654 5B

Assessing Potential Radiological Impacts to Aquatic Biota in Response to the National Environmental Policy Act (NEPA) of 1969,
W74-11957 5C

STRESS ANALYSIS
High-Pressure Mechanical Properties of Kayenta Sandstone,
W74-11662 8E

STRIPED BASS
The Effects of Total Dissolved Solids, Temperature, and pH on the Survival of Immature Striped Bass: A Response Surface Experiment,
W74-11935 5C

STRIPED BASSES
Mercury in Striped Bass and Bluefish,
W74-11488 5A

STRONTIUM
Simplified Atomic Absorption Determination of Stable Strontium in Milk and Hay: A Comparison of Methods and Stepwise Procedure,
W74-11652 5A

Ratio of CS-137 -- SR-90 in Ocean and Sea Water,
W74-11959 5B

SUBCRITICAL FLOW
Free Surface Subcritical Flow Measurement,
W74-11520 7B

SUDAN (WHITE NILE)
A Hydrological Study of the Southern Sudd Region of the Upper Nile,
W74-11905 4A

SUPERCRITICAL FLOW
Gauging Stations on Sediment-Loaded Mountain Rivers,
W74-11522 7B

Flow Measurement of Low-Gradient Streams in Sandy Soils,
W74-11523 7B

SUPERCRITICAL FLUMES
Laboratory Calibration of the Walnut Gulch Supercritical Flow-Measuring Flume,
W74-11519 7B

SUPERSATURATION
Surface Agitators as a Means to Reduce Nitrogen Gas in a Hatchery Water Supply,
W74-11936 5C

A Device for Alleviating Supersaturation of Gases in Hatchery Water Supplies,
W74-11941 5C

SURF
Sediment Transport Due to Oscillatory Waves,
W74-11731 2L

SURFACE-GROUNDWATER RELATIONSHIPS
Computer Model for Determining Bank Storage at Hungry Horse Reservoir, Northwestern Montana,
W74-11732 4B

SURFACE WATERS
Deuterium and Oxygen-18 Measurements on Surface Waters of the Bavarian Prealps,
W74-11550 2K

Surface-Water Availability, Talladega County, Alabama,
W74-11767 7C

Encroaching Salt Water in Northeast Palm Beach County, Florida,
W74-11779 7C

Assessing Potential Radiological Impacts to Aquatic Biota in Response to the National Environmental Policy Act (NEPA) of 1969,
W74-11957 5C

Availability of Data on Surface-Water Quantity and Quality for the San Francisco Bay Region, California, with a Summary of Beneficial Uses and Implications for Land Use,
W74-11980 7C

SURFACES
Effect of Surface Wettability on Capillary Movement of Water in Soil (Vliyaniye smachivayemosti poverkhnosti na kapillyarnoye peredvizheniye vlagi v pochve),
W74-11452 2G

SURFACTANTS
Lethal Response by Atlantic Salmon Parr. to Some Polyoxyethylated Cationic and Nonionic Surfactants,
W74-11481 5C

SURGES
Splash (Special Program to List Amplitudes of Surges From Hurricanes): 1. Landfall Storms,
W74-11776 2E

SURVEILLANCE PROGRAMS
Environmental Radiation Dose Criteria and Assessment: Pathway Modeling and Surveillance,
W74-11653 5B

SURVEYING INSTRUMENTS
The Development and Performance of a New High Accuracy Hydrographic Tellurometer Model MRB 201,
W74-11535 7B

Modern Position Fixing Methods,
W74-11536 7B

The Application of an Orientation System for Continuous Observations for the Compilation of River Channel Maps by Means of an Echo Sounder,
W74-11537 7B

Digital Measurements of River Bed Profiles Using a General-Purpose Data Acquisition System,
W74-11538 7B

SURVEYS
Nuclear Power and Public Opinion,
W74-11656 5G

Wastewater Sampling and Testing Instrumentation,
W74-11754 5A

Dynamics of Playa Lakes in the Texas High Plains,
W74-11774 7B

Geochemical Methods in Geothermal Exploration,
W74-11786 2K

A Survey of Land Application of Waste Water Facilities,
W74-11852 5D

Population, Resources, and Pollution, and Their Impact on the Hudson Estuary,
W74-11870 5B

The North Atlantic Ocean as a Source of Atmospheric N2O,
W74-11900 2K

Spring Thermocline Behavior in Lake Ontario During IFYGL,
W74-11903 2H

Carbon Monoxide in the South Pacific Ocean,
W74-11904 2K

Aerial Radiological Measuring Survey of the Area Surrounding the Hallam Nuclear Power Favility, Hallam, Nebraska, September 20, 1968.
W74-11960 5B

SUSPENDED LOAD
Experiences with Photometric Turbidity Measurements,
W74-11540 7B

Statistical Parameters of Distribution of Granulation Indicating Suspended Sediment and Bed Sediment,
W74-11542 2J

Suspended-Sediment Load of Texas Streams, Compilation Report October 1965-September 1971,
W74-11991 2J

SUSPENDED SOLIDS
Aspects of the Distribution and Trace Element Composition of Suspended Matter in the Black Sea,
W74-11709 5B

Fate of Materials Applied,
W74-11848 5B

SWITZERLAND
Gauging Stations on Sediment-Loaded Mountain Rivers,
W74-11522 7B

Measurement and Significance of Electrical Conductivity in Small Mountain Streams,
W74-11547 7B

SYNTHETIC HYDROLOGY
A Bayesian Approach to Hydrologic Time Series Modeling,
W74-11456 6A

What Is, and What Is Not, a Markov Chain,
W74-11470 2A

SYSTEMS ANALYSIS
Planning and Analysis of Metropolitan Water Resource Systems,
W74-11451 6A

A Selected Annotated Bibliography on the Analysis of Water Resource Systems, Fifth Volume,
W74-11574 6A

Urban Water Resources--Some Planning Fundamentals,
W74-11645 6B

A Survey of Papers on Ecosystems Analysis from 1947-1971 in the Journal 'Ecology',
W74-11668 5B

Models for Allocation of Water Resources,
W74-11696 6A

Tocks Island Lake Project,
W74-11891 6A

TAIWAN
High Zinc Concentration in Common Carp Viscera,
W74-11946 5C

TALLADEGA COUNTY (ALA)
Surface-Water Availability, Talladega County, Alabama,
W74-11767 7C

TAMWORTH (AUST)
Urban-Rural Conflicts in Urban Water Supply,
W74-11694 6D

TANNERY WASTES
Characterization and Treatability of Chrome Tanning Waste,
W74-11707 5D

TELEMETRY
A Portable Water-Stage Recorder for Experimental Hydrological Measurements,
W74-11497 7B

Instruments for Measurement of Currents and Levels in Natural Reservoirs and Rivers,
W74-11505 7B

Earth Satellites and Their Applications in Hydrometry and Hydrology,
W74-11553 7B

Hydra II--Automatic Digital Telemetering System,
W74-11555 7B

Radio Control of Water Level Gauges in Watercourses Endangered by High Water Levels,
W74-11557 7B

A Computer Automated System for Hydrologic Data Acquisition and Analyses,
W74-11558 7B

Recording and Teletransmission of Measured Data in Hydrology and Relevant WMO Activities,
W74-11559 7B

A Network for Continuous Monitoring of Water Quality in the Trinity River Basin, Texas,
W74-11995 5B

TELLUROMETERS
The Development and Performance of a New High Accuracy Hydrographic Tellurometer Model MRB 201,
W74-11535 7B

TEMPERATURE
Method for Indirectly Defining Optimum Temperatures of Inhabitancy for Marine Cold-Blooded Animals,
W74-11487 5C

Biologically Allowable Thermal Pollution Limits, Part I and Part II,
W74-11921 5C

The Effects of Total Dissolved Solids, Temperature, and pH on the Survival of Immature Striped Bass: A Response Surface Experiment,
W74-11935 5C

Mass Stranding of Molluscs at Te Waewae Bay, Southland, New Zealand,
W74-11938 5C

TEMPERATURE TOLERANCE
Salinity and Temperature Tolerance of Zoeae of the Portunid Crab Scylla Serrata,
W74-11950 5C

TENNESSEE
Environmental Monitoring Report - United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1971.
W74-11659 5B

The Occurrence and Retention of Radionuclides in the Sediments of White Oak Lake,
W74-11665 5B

Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1973.
W74-11667 5B

Applied Health Physics and Safety Annual Report 1971,
W74-11669 5B

TENNESSEE RIVER
Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1972.
W74-11658 5B

Environmental Monitoring Report, United States Atomic Energy Commission, Oak Ridge Facilities, Calendar Year 1973.
W74-11667 5B

TERRESTRIAL HABITATS
Land Disposal of Waste Water: Processes, Design Criteria, and Planning Considerations,
W74-11569 5D

TESTING
Annual Report - Vertical Tube Evaporator Multistage Flash Test Bed Plant, Freeport, Texas, March 19, 1971 to March 31, 1972.
W74-11807 3A

TESTING PROCEDURES
Simplified Atomic Absorption Determination of Stable Strontium in Milk and Hay: A Comparison of Methods and Stepwise Procedure,
W74-11652 5A

A Test Method for Volatile Component Stripping of Waste Water,
W74-11801 5D

TEXAS
Hydrologic Investigations of the Groundwaters of Central Texas Using U-234/U-238 Disequilibrium,
W74-11465 2F

Measurement of Discharge as Inflow Into Leaky Reservoirs,
W74-11529 7B

Final Environmental Statement Related to the Proposed Comanche Peak Steam Electric Station Units 1 and 2.
W74-11674 5B

Hydrologic Data for Little Pond Creek and North Elm Creek, Brazos River Basin, Texas, 1972,
W74-11733 2E

Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1972,
W74-11737 2F

Low-Flow Characteristics of Selected Streams in the Sabine River Basin Downstream from Toledo Bend Reservoir,
W74-11743 2E

Mississippi River Water from Texas,
W74-11766 4A

Phosphorus Removal and Disposal from Municipal Waste Water.
W74-11928 5D

Suspended-Sediment Load of Texas Streams, Compilation Report October 1965-September 1971,
W74-11991 2J

Groundwater Resources of Brazos and Burleson Counties, Texas,
W74-11994 4B

A Network for Continuous Monitoring of Water Quality in the Trinity River Basin, Texas,
W74-11995 5B

Hydrologic Data for Cow Bayou Brazos River Basin Texas, 1972,
W74-11999 7C

THAILAND
Stream Gauging Network of the Lower Mekong Basin,
W74-11499 7B

THAWING
Some Radiation and Temperature Characteristics of Thawing of Snow During the Winter of 1959-60,
W74-11765 2C

THERMAL POLLUTION
Chlorination Experiments at the John E. Amos Plant of the Appalachian Power Company: April 9-10, 1973,
W74-11676 5A

Surface Jet Stream Excess Temperature Analysis,
W74-11748 5B

The Effect of Heated Water on the Temperature and Evaporation of Hyco Lake, North Carolina, 1966-72,
W74-11751 5C

Biologically Allowable Thermal Pollution Limits, Part I and Part II,
W74-11921 5C

Effects of Hydroelectric Development in Western Canada on Aquatic Ecosystems,
W74-11944 5C

THERMAL WATER
Geophysical Methods in Geothermal Exploration,
W74-11762 4B

THERMOCLINE
Rapid Coastal Bottom Water Temperature Rises,
W74-11901 2L

Spring Thermocline Behavior in Lake Ontario During IFYGL,
W74-11903 2H

THERMOMETERS
The Measurement of Mean Temperature on a Reaction Velocity Basis and its Application to Hydrology,
W74-11539 7B

THIN FILMS
Desalination Membranes from Built-Up Multilayer Films,
W74-11636 3A

TIDAL STREAMS
Do-Sag in Oscillating Flow,
W74-11897 5B

TIDES
Splash (Special Program to List Amplitudes of Surges From Hurricanes): 1. Landfall Storms,
W74-11776 2E

TIME SERIES ANALYSIS
A Bayesian Approach to Hydrologic Time Series Modeling,
W74-11456 6A

TITANIUM
Solvent Extraction of Nitrate from Titanium Leacher Effluent,
W74-11763 5D

TOCK'S ISLAND DAM (DELAWARE RIVER BASIN)
Tocks Island Lake Project,
W74-11891 6A

TOXICITY
Pollution and Poisoning,
W74-11702 5B

Toxicity for Cats of Methylmercury in Contaminated Fish from Swedish Lakes and of Methyl-Mercury Hydroxide Added to Fish,
W74-11711 5C

Standards for the Prevention of Occupational Lead Poisoning,
W74-11714 5C

Electron Microscopic Study of Cadmium Nephrotoxicity in the Rat,
W74-11719 5C

Some Constraints of Spreading Sludge on Cropland,
W74-11838 5D

How Much Metal is There in Our Waters,
W74-11918 5B

The Relation Between Water Quality and the Status of Fish Populations in Willow Brook,
W74-11932 5C

Effect of Rate and Duration of Feeding DDT on the Reproduction of Salmonid Fishes Reared and Held Under Controlled Conditions,
W74-11933 5C

Factors Influencing Formalin Toxicity in Trout,
W74-11947 5C

TRACE ELEMENTS
Aspects of the Distribution and Trace Element Composition of Suspended Matter in the Black Sea,
W74-11709 5B

Biologic Effect of Metallic Contaminants-The Next Step,
W74-11720 5C

Preliminary Studies of the Shock Tube as an Excitation Source for the Analysis of Selected Trace Metals in Aqueous Media,
W74-11913 5A

Cadmium - A Trace Element of Concern in Mining and Manufacturing,
W74-11919 5B

Trace Metals in New York State Fish,
W74-11934 5C

NSF-RANN Trace Contaminants Directory, 1973,
W74-11961 5A

TRACERS
Chemical Method of Water Flow Measurement in Open Channels,
W74-11515 7B

Precision and Bias of the Results of Dilution Gaugings,
W74-11517 7B

Field Studies of Sediment Movement Using Fluorescent Tracers,
W74-11544 2J

Movement and Dispersion of Soluble Materials in Salem Creek, Muddy Creek and Yadkin River Between Winston-Salem and Salisbury, North Carolina,
W74-11749 5B

Time of Travel and Dye Dosage for an Irrigation Canal System Near Duchesne, Utah,
W74-11970 2E

TRANSPIRATION
The Effect of Inorganic Nutrients on Water Economy and Hardiness of Conifers: I. The Effect of Varying Potassium, Calcium and Magnesium Levels on Water Content, Transpiration Rate and the Initial Phase of Development of Frost Hardiness of Pinus silvestris L. Seedlings,
W74-11648 2D

A Study of the Transpiration Increasing Effect of Wind,
W74-11864 2D

TRAVEL TIME
Generalization of Stream Travel Rates and Dispersion Characteristics from Time-of-Travel Measurements,
W74-11971 2E

TREATMENT FACILITIES
Waste Water Treatment Needs for Ames,
W74-11620 6B

A Survey of Land Application of Waste Water Facilities,
W74-11852 5D

The Estuary and Industrial Wastes: Power Plants,
W74-11869 5D

TRICKLING FILTERS
Treatment of Packinghouse Wastes by Anaerobic Lagoons and Plastic-Media Filters,
W74-11797 5D

TRINITY ACQUIFER
Hydrologic Investigations of the Groundwaters of Central Texas Using U-234/U-238 Disequilibrium,
W74-11465 2F

TRINITY RIVER BASIN (TX)
A Network for Continuous Monitoring of Water Quality in the Trinity River Basin, Texas,
W74-11995 5B

TRITIUM
Tritium Control Technology,
W74-11673 5D

TROPICAL REGIONS
Evaporimetry in the Canal Zone: Part II, Comparison of Various Types of Evaporimeters on an Hourly Basis,
W74-11740 2D

TUBES
MSF Distillation Plant (Module), Vertical Tube Evaporation (VTEX), Semi-Annual Report, June 1, 1970, through December 31, 1970,
W74-11831 3A

TUNNELING
Percussive Water Jets for Rapid Excavation--Final Report,
W74-11997 8H

TURBIDITY
Experiences with Photometric Turbidity Measurements,
W74-11540 7B

Practical Experience with Devices to Measure O2 Content, Turbidity, Solid Matter Content and Electrical Conductivity Used for Monitoring Water Quality in Rivers,
W74-11548 5A

Preliminary Studies Using Synthetic Polymers to Reduce Turbidity in a Hatchery Water Supply,
W74-11942 5C

TURBULENT FLOW
Viscous Drag Reduction in Developing Pipe Flow,
W74-11755 8B

Investigation of Diffusion in Open-Channel Flows,
W74-11972 2E

ULTRATHIN FILMS
Desalination Membranes from Built-Up Multilayer Films,
W74-11636 3A

UNDERGROUND
Disposal of Solid Radioactive Wastes in Bedded Salt Deposits.
W74-11657 5E

UNDERGROUND CAVITIES
Detection of Subsurface Cavities,
W74-11756 4B

UNGAGED WATERSHEDS
Unit Hydrographs for Catchments of Different Sizes and Dissimilar Regions,
W74-11466 2A

UNIFORM FLOW
Hydraulics of Main Channel-Floodplain Flows,
W74-11462 8B

UNIT HYDROGRAPHS
Unit Hydrographs for Catchments of Different Sizes and Dissimilar Regions,
W74-11466 2A

Variable Unit Hydrograph,
W74-11471 2A

UNITED KINGDOM
Regional Development of Groundwater Resources in Combination with Surface Waters,
W74-11464 4B

UNITED KINGDOM (MANCHESTER-ENG)
City of Manchester--Main Drainage Work 6,
W74-11868 4A

UNITED STATES
Rainfall Intensities in the Conterminous United States and Hawaii (Supplement 1 to ETL-SR-72-5: Distribution of Mean Monthly Precipitation and Rainfall Intensities),
W74-11747 2B

UNSATURATED FLOW
Air and Water Flow During Ponded Infiltration in a Vertical Bounded Column of Soil,
W74-11467 2G

UNSTEADY FLOW
Hydraulics of Main Channel-Floodplain Flows,
W74-11462 8B

Surface-Wave Transport in Nonuniform Canals,
W74-11968 8B

UPWELLING
Longshore Currents and the Onset of Upwelling Over Bottom Slope,
W74-11896 2L

URANIUM MINING
State-of-the-Art: Uranium Mining, Milling, and Refining Industry.
W74-11791 5D

URBAN DRAINAGE
The Illinois Urban Drainage Area Simulator, ILLUDAS,
W74-11889 5B

URBAN HYDROLOGY
The Use of Radar in Urban Hydrology,
W74-11468 2E

Free Surface Subcritical Flow Measurement,
W74-11520 7B

Stream Water Quality as it is Influenced by Urban Communities,
W74-11618 6B

Hydrologic Data for Urban Studies in the Fort Worth, Texas, Metropolitan Area, 1972,
W74-11737 2F

The Illinois Urban Drainage Area Simulator, ILLUDAS,
W74-11889 5B

Urban Runoff by Linearized Subhydrographic Method,
W74-11890 2A

An Approach to Estimating Flood Frequency for Urban Areas in Oklahoma,
W74-11998 4A

URBAN RUNOFF
Nutrient Loading from a Separate Storm Sewer in Madison, Wisconsin,
W74-11853 5B

Urban Runoff by Linearized Subhydrographic Method,
W74-11890 2A

An Approach to Estimating Flood Frequency for Urban Areas in Oklahoma,
W74-11998 4A

URBAN-RURAL CONFLICTS
Urban-Rural Conflicts in Urban Water Supply,
W74-11694 6D

URBANIZATION
Extent and Development of Urban Flood Plains,

CENTERS OF COMPETENCE
AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 23
DECEMBER 1, 1974

W74-12001 -- W74-12750

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 7, NUMBER 23
DECEMBER 1, 1974

W74-12001 -- W74-12750

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

Identifiers: *Seacoasts, Delaware Bay(Delaware), Coastal zone.

Research emphasizing coastal geologic processes, wave and sediment analysis, and remote sensing investigations is summarized. A process-response model based on Krumbein's concept was conceived and formulated for beach processes. A conceptual classification of sandy coastal plain shorelines was completed. Mechanics of sediment motion and transport in the wave field were systematically analyzed, and the results applied to the random wave field. Probabilistic and statistical concepts and methods are being developed for practical and reliable predictions of primary physical, meteorological and geological parameters. A thermodynamic model of sea state has been developed on the analogy drawn between the problem of black body radiation in thermal physics and the problem of spectral distribution of wave energy in air-sea interactions. Optical Fourier techniques were employed to determine changing directional spectrum of waves. Fronts, a major hydrographic feature in Delaware Bay and other estuaries, have been investigated. An inexpensive, rapid approach for continuously monitoring optical water properties along a coastal transect has been developed. Marsh gas of southeastern tidal mangrove marshes, Spartina, freshwater acidic and sawgrass swamps was compared to that from inland marshes separated from tidal action and indicated a Eh relationship. A FEASIBILITY STUDY OF USING REMOTELY SENSED DATA FOR WATER RESOURCE MODELS,
Colorado State Univ., Fort Collins.
J. F. Ruff.
Available from NTIS, Springfield, Va 22161 as N73-23479, Price $3.75 printed copy; $2.25 microfiche. National Aeronautics and Space Administration Contractor Report CR-129001, February 1973. 29 p, 15 fig, 2 tab, 4 ref. NAS 8-28590.

Descriptors: *Remote sensing, *Water resources, *Colorado, Water temperature, Snow surveys, Water yield, Sedimentation, Erosion, Clouds, Scour.
Identifiers: *Wolf Creek watershed(Colo).

Remotely sensed data were collected in the Wolf Creek watershed in southwestern Colorado over a 1-year period. Cloud top temperatures were measured using a radiometer. Thermal imagery of the Wolf Creek Pass area was obtained during one predawn flight. Remote sensing studies of water resource problems were also conducted. Remote sensing techniques assist in the solution of water resource problems. Photogrammetric determination of snow depths is feasible. Changes in turbidity or suspended material concentration can be observed. Surface turbulence can be related to bed scour. Thermal effluents into rivers can be monitored. (Knapp-USGS)

WATERSHED MODELLING USING A SQUARE GRID TECHNIQUE,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
N. Kouwen.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 418-434, 1973. 3 fig, 7 ref.

Descriptors: *Mathematical models, *Rainfall-runoff relationships, *Storm runoff, *Runoff forecasting, *Canada, Infiltration, Water storage, Discharge(Water), Finite element analysis.

A typical Southern Ontario watershed was simulated using storage discharge relationships for 1 km x 1 km square elements. With the model, hydrographs may be based on forecast weather, especially with regard to the prediction of flood peaks based on presumed weather conditions. Precipitation data measured by radar may be used in calculating storm runoff during a storm to aid in the operation of dams. Runoff passes through successive square elements to lower elevations. The elements are ordered with respect to their elevation and calculation proceeds in a downstream sequence. For each element there exists: a channel capacity-drainage area function; a surface storage-channel inflow function; a surface storage-infiltration function; a subsurface storage-channel inflow function; and a channel storage-channel discharge function. BASSETT CREEK WATERSHED MODEL,
Barr Engineering Co., Minneapolis, Minn.
L. J. Kremer.
Water Resources Bulletin, American Water Resources Association, Vol 10, No 4, p 789-793, August 1974. 3 fig, 5 ref.

Descriptors: *Minnesota, *Watersheds(Basins), *Model studies, *Urban hydrology, Hydrograph analysis, Synthesis, Surface waters, Floods, Flood control, Hydrology, Runoff, Surface runoff, Storm runoff, Urbanization.
Identifiers: Minneapolis(Minn), *Bassett Creek Watershed(Minn).

A synthetic hydrograph method was utilized in the development of a watershed model for a small urbanizing watershed. The model was applied to the watershed and the largest flood of record was accurately reproduced. Because the model would be utilized for design of flood control plans with complete urbanization, the method was also applied to an urbanized watershed and reproduced a measured event with good results. The method does not require extensive hydrologic data for its implementation, can be applied to watersheds in various stages of urbanization, and permits consideration of natural or potential floodwater storage. ECOSYSTEM MODELING OF A FORESTED RIVER BASIN,
Washington Univ., Seattle. Coll. of Forest Resources.
J. A. Ryan, I. G. Morison, and J. S. Bethel.

Water Resources Bulletin, American Water Resources Association, Vol 10, No 4, p 703-709, August 1974. 11 ref.

Descriptors: *Ecosystems, *River basins, *Forest watersheds, *Runoff, Model studies, Forest management, *Washington, Land use, Environmental effects, Precipitation, Evapotranspiration, Sediment load, Simulation analysis.
Identifiers: Physical parameters, *Deterministic models, *Snohomish River Basin(Wash), Stream temperature, Multiple player management game, Cascade Mountains(Wash), Resource management, Detention storage.

The forest ecosystem of the Snohomish River Basin in the Cascade Mountains of western Washington was modeled to develop an effective decision tool for evaluating environmental impacts resulting from land and forest management practices. A computer simulation model dealt with physical subsystems including product conversion, forest production, recreation supply, wildlife and fisheries, and the interaction of these processes with the water and atmosphere. This model was interfaced with a multiple player management game which enabled land managers, manufacturers, and regulators to make decisions and respond to environmental effects. Responses of the hydrologic system to management decisions were simulated by the water subsystem model. The model emphasized non-point as well as point source impacts. Since the significance of impacts varies with land use and goals of the game players, the model had flexible resolution and was able to predict conditions for both large and small scale. The water subsystem model responded to management decisions by game players for 40 acre cells within the Basin. The model determined which streams were affected, defined the contributing watershed, and extracted model parameters and information from a data bank. Using these parameters and precipitation inputs, mean flow on monthly and annual bases was calculated for the impacted subwatersheds and the 21 major watersheds of the Basin. Water quality responses calculated were suspended sediment concentration and stream temperature increase due to exposure. (Adams-ISWS)

THEORETICAL JUSTIFICATION OF PEARSON DISTRIBUTION CURVES,
V. F. Kryukov.
Soviet Hydrology: Selected Papers, No 1, p 71-76, 1973. 7 ref. Translated from GGI, Sbornik rabot po gidrologii, No 10, p 110-118, 1973.

Descriptors: *Statistical models, *Mathematical studies, *Mardov processes, *Synthetic hydrology, Probability, Stochastic processes, Statistical methods, Hydrographys, Statistics, Analytical techniques, Theoretical analysis.
Identifiers: *Pearson distribution curves.

Probability distribution curves in the form of a Pearson probability curve of type III have been extensively used in Soviet hydrologic practice as a useful and flexible means of smoothing and extrapolating hydrologic distributions. The Markov distribution served as a theoretical justification of the most important types of distribution curves introduced by Pearson. The mathematical development showed that Pearson Curves can be justified theoretically and cannot be regarded only as a successful empirical means of smoothing statistical distributions. Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 077; $3.00 in paper copy, $2.25 in microfiche. Completion Report, 1974. 10 p. OWRR A-033-CONN(3). OWRR 14-31-0001-3807.

Descriptors: *Parametic hydrology, *Meteorology, *Drainage area, *Hydrologic cycle, *Statistical methods, *Computer models, Meteoric water, Precipitation(Atmospheric), Runoff, Water storage, Evapotranspiration.
Identifiers: Hydrometeorological approach, Hydrologic components, Atmospheric divergence, Atmospheric vapor.

An interdisciplinary methodology based on hydrologic, statistical and computer principles is used to demonstrate that a hydrometeorological approach can provide reasonable estimates of hydrologic components for both smaller drainage areas, varying in size from 20,000 sq. mi. to 58,000 sq. mi., and larger drainage areas, which are formed by combining individual areas in random or systematic fashion. In this way, the time series of seven hydrologic components are generated for 26 smaller and 10 larger (combined) drainage areas of the United States. These generated series of input and output quantities are further subjected to the statistical analyses which include autocorrelation analysis, spectral and cross spectral density techniques, two way analysis of variance, and simple correlation theory. The geographic distribution of statistical parameters of these hydrologic series is compared with the available maps of various meteorological and physical features. Such comparisons reflect the adequate correlation between these computed statistical parameters and physical factors. The computer simulation procedure is developed to estimate the maximum and minimum 'design' values for the seven hydrologic components of the United States. (deLara-Connecticut)

INSTRUCTION MANUAL FOR EXPENDABLE DEW POINT HYGROMETER.
EG and G International, Inc., Waltham, Mass. Environmental Equipment Div.
Available from NTIS, Springfield, Va 22161 as AD-760 810, Price $3.00 printed copy; $2.25 microfiche. Air Force Cambridge Research Laboratories Technical Report 73-0297(11), January 1971. 50 p, 6 fig. AF F19628-69-C-0173.

Descriptors: *Meteorological data, *Humidity, *Telemetry, *Hygrometry, *Instrumentation, Automation, Moisture meters.
Identifiers: *Hygrometers.

An expendable dew point hygrometer was designed for tropospheric balloon soundings. It is designed to be used in conjunction with a radiosonde in gathering meteorological data. The measurement of dew point temperature is accomplished by a thermistor mounted in a dew point sensor which senses temperature as a resistance and provides a signal to the radiosonde. The radiosonde is a balloon-borne, battery powered, meteorological instrument that automatically transmits radio signals relating to the atmosphere pressure, air temperature and dew point temperature of the upper air to ground receiving equipment. A PHYTOCLIMATIC APPROACH TO THE PROBLEM OF MEDITERRANEITY IN THE INDO-PAKISTAN SUB-CONTINENT,
V. M. Meher-Homji.
Feddes Repert Z Bot Taxon Geobot. Vol 83, No 9/10, p 757-788, Illus, 1973.
Identifiers: Cedrus-deodara, *Climatic conditions, *Evergreen forests, *Mediterraneity, Oleacuspidata, *Pakistan, Pistacia-khinjuk, Pistaciamutica, Punica-granatum, Quercus-baloot, Rains, Sclerophyllous, Season, Temperature, *India.

In the northwest part of the sub-continent, winter-spring rains coupled with low temperature and dry, hot summer create Mediterranean conditions. Variants may be recognized in relation to aridity, temperature of the coldest month and intensity of summer dryness based on the contribution of average summer rainfall and rainy days to the an-

nual total, percentage frequency of estival rainfall and rainy days, percentage number of years showing mediterranean regime. The degrees of Mediterraneity (pure, moderate, attenuated) recognized according to the above criteria are supported by phytogeographic evidence. Dry evergreen sclerophyllous forests, with one or more of the typical mediterranean species like Olea cuspidata, Pistacia khinjuk, P. mutica, Quercus baloot, Punica granatum, Cedrus deodara occur under a moderate degree of Mediterraneity. Some of these and few others of mediterranean stock persist under attenuated degree, though the forest physiognomy is not well developed. The floristic elements viz., Mediterranean, tropical, arid zone and general, show close correlations with the degrees of Mediterraneity, aridity and temperature regimes.--Copyright 1974, Biological Abstracts, Inc.

ON THE SYNTHESIS OF RANDOM FIELD SAMPLING FROM THE SPECTRUM: AN APPLICATION TO THE GENERATION OF HYDROLOGIC SPATIAL PROCESSES,
Instituto Venezolano de Investigaciones Cientificas, Caracas.
J. M. Mejia, and I. Rodriguez-Iturbe.
Water Resources Research, Vol 10, No 4, p 705-711, August 1974. 3 tab, 4 ref. NOAA Contract 2-36235, OWRR Grant 14-31-0001-9021.

Descriptors: *Synthesis, *Spatial distribution, *Frequency, *Temporal distribution, *Rainfall, Correlation analysis, Isotropy.
Identifiers: *Spectral density function, *Harmonics, Random frequencies, Ergodic, Multivariate process.

A procedure for the synthesis of processes exhibiting temporal and spatial variability was presented. The method involved the addition of harmonics of random frequencies that were sampled from the spectral density function or the radial spectral density function. The process obtained was asymptotically Gaussian and ergodic. The scheme presented can be utilized for synthetic generation of spatial processes such as rainfall. The method provides a specified way to study areal extremes in precipitation and differences with respect to point extreme rainfall. An estimate of the error in time or space averages due to the nonergodicity of the process as a function of the number of harmonics was also included. (Bhowmik-ISWS)

DECISION ANALYSIS OF A GAMMA HYDROLOGIC VARIATE,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
S. Yakowitz, L. Duckstein, and C. Kisiel.
Water Resources Research, Vol 10, No 4, p 695-704, August 1974. 2 fig, 7 tab, 25 ref. NSF Grants GK-35791 and GK-35915.

Descriptors: *Storms, *Rainfall, *Runoff, *Decision making, *Statistical models, Simulation analysis, Monte Carlo method, Parametric hydrology, *Arizona.
Identifiers: Poisson variate, Bayesian, Exponential family, Gauss-Legendre quadrature, Gamma family, Deterministic watershed model, Winter storms, *Tucson(Ariz).

Study was devoted to the quantitative analysis of winter-type rainfall and its subsequent use in decision analysis. Results indicated that the exponential family did not statistically fit the rainfall per event in winter storms. Statistical tests indicated that the gamma family described the precipitation process of winter storms for the Tucson rainfall record. A natural conjugate family for the gamma law was derived and discussed. Numerical methods for Bayesian analysis of the gamma variate were explained and tested on simulated data. Examples of decision making when the gamma family is the underlying law were also described. The method of decision analysis presented can be applied to other hydrologic problems in which the gamma distribution, also called the Pearson type 3, is a plausible model. It was concluded that the bulk of the numerical methods derived will prove useful in many other Bayesian decision theory contexts. (Bhowmik-ISWS)

ACCURACY OF PRECIPITATION MEASUREMENTS FOR HYDROLOGIC MODELING,
Silver Spring, Md. National Weather Service, Hydrologic Research and Development Lab.
L. W. Larson, and E. L. Peck.
Water Resources Research, Vol 10, No 4, p 857-863, August 1974. 7 fig, 2 tab, 28 ref.

Descriptors: *Precipitation(Atmospheric), *Rain gages, *Instrumentation, Watersheds(Basins), Cyclones, Hydrologic data, Precipitation gages, Effective precipitation, Hydrologic cycle, Hydrology, Winds, Clouds, Storms.
Identifiers: *Gage shields, *Gage catch deficiencies, *Pemigewasset River Basin(NH), *Precipitation input, Meteoric water.

The use of precipitation data as input for conceptual models has enhanced the need for measurements more representative of 'true' precipitation. Precipitation input to continuous watershed models is generally some form of mean basin precipitation estimate based on point measurements. Each point measurement can have large catch deficiencies due to wind, especially for solid precipitation. A brief review was made of past results from studies concerned with these deficiencies. New curves based on current studies were presented for wind-caused gage catch deficiencies for both rain and snow. The results of using gage catch correction factors to adjust precipitation input to a conceptual hydrologic model were presented. (Roberts-ISWS)

THE DESIGN OF RAINFALL NETWORKS IN TIME AND SPACE,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
I. Rodriguez-Iturbe, and J. M. Mejaijn.
Water Resources Research, Vol 10, No 4, p 713-728, August 1974. 12 fig, 9 tab, 23 ref. NOAA Contract 2-36235.

Descriptors: *Rainfall, *Networks, *Design, Time, Water resources, Planning, Management, Water balance, Hydrologic budget, Equations, Mathematical studies, Cyclones, Probability, Hydrologic data, Precipitation(Atmospheric), Networks.
Identifiers: *Spatial sampling, *Variance reduction factor, *Covariance function, Random design, Bessel-Type correlation, Areal mean, Long-Term mean, Areal rainfall, Space, Rainfall process, Development.

A methodology for the design of precipitation networks was formulated. The network problem was discussed in its general conception and then focus was made on networks to provide background information for the design of more specific gaging systems. The rainfall process was described in terms of its correlation structure in time and space. A general framework was developed to estimate the variance of the sample long-term mean areal precipitation and mean areal rainfall of a storm event. The variance was expressed as a function of correlation in time, correlation in space, length of operation of the network, and geometry of the gaging array. The trade of time versus space was quantitatively developed, and realistic examples were worked out showing the influence of the network design scheme on the variance of the estimated values. METEOROLOGICAL CRITERIA FOR EXTREME FLOODS FOR FOUR BASINS IN THE TENNESSEE AND CUMBERLAND RIVER WATERSHEDS,
National Weather Service, Silver Spring, Md. Hydrometeorological Branch.
F. K. Schwarz.
Available from Sup Doc, GPO, Washington, D C 20402, Price $0.90 domestic postpaid; $0.65 GPO Bookstore. National Oceanic and Atmospheric Administration Hydrometeorological Report No 47, May 1973. 59 p, 27 fig, 13 tab, 8 ref. TVA Contract TV-36522A.

Descriptors: *Floods, *Maximum probable flood, *Tennessee Valley Authority, Reservoirs, *Tennessee River, Flood forecasting, Rainfall-runoff relationships, Probable maximum precipitation, Weather patterns.
Identifiers: *Cumberland River(Tenn).

Rainfall criteria are given which permit definition of maximum flood levels along the Tennessee River from the mouth upstream to TVA's Browns Ferry Nuclear Plant at mile 294. In 1968 maximum rainfall depths were defined for the 16,170-sq-mi drainage area above the Browns Ferry plant and below TVA's major tributary dams. In 1970 the study was extended to include the 26,780-sq-mi drainage area above Kentucky Dam and below TVA's major tributary dams. This latter study included definition of concurrent rainfall expected on the Cumberland Basin as required to evaluate the effects of the canal which connects the two rivers just upstream of Kentucky Dam. Studies were made in 1971 to provide rainfall criteria for defining maximum flood levels along the Cumberland River above Old Hickory Dam. This required defining rainfall for both the 11,674-sq-mi drainage area above the dam and the 2,734-sq-mi watershed between Old Hickory and the next major upstream dams, Center Hill, Dale Hollow, and Wolf Creek. INTERCEPTION OF RAINFALL BY HARD BEECH (NOTHOFAGUS TRUNCATA) AT TAITA, NEW ZEALAND,
Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Soil Bureau.
R. Aldridge, and R. J. Jackson.
N Z J Sci. Vol 16, No 1, p 185-198. 1973. Illus.

Descriptors: *Stemflow, Throughfall, Rainfall, *Precipitation(Atmospheric), Soil moisture.
Identifiers: *Beech, Fagus-spp, Flow, *New Zealand, Nothofagus-truncata, Stem, Taita, Winter, Fagus.

Throughfall and stemflow were measured in a stand of hard beech 100-120 yr old and 10-15 m tall. Throughfall commenced when gross rainfall exceeded 0.5 mm. For storms with gross rainfall greater than 10 mm, 45-50% of it reached the ground as throughfall. The presence of scars resulting from fires made most trunks unsuitable for stemflow measurement, but data were obtained from 2 trunks with breast-height diameter (d.b.h.) 0.25 m and one with 0.6 m d.b.h. Stemflow commenced when gross rainfall exceeded 1.3 mm. For storms with gross rainfall greater than 10 mm,

stemflow was 20-25% and 10-15% of gross rainfall from the small and large trees respectively. Stemflow was greater when rain was accompanied by strong winds than in storms with light winds. The proportion of gross rainfall reaching the ground as stemflow is similar to that found in studies on beech (Fagus) species in the Northern Hemisphere. Significant effects of stemflow on soil moisture distribution and on soil properties are expected. In winter the interception loss was much greater than conventional estimates of potential evapotranspiration.--Copyright 1974, Biological Abstracts, Inc.

STRENGTH CALCULATIONS OF ICE COVER,
D. F. Panfilov.
Available from NTIS, Springfield, Va. 22161 as AD-762 105, Price $3.00 printed copy; $2.25 microfiche. Army Foreign Science and Technology Center Translation, March 1973. 9 p, 2 fig, 1 tab, 18 ref. (Trans. from Stroitel'stvo i Arkhitekturz, Vol 6, p 128-133, 1970).

Descriptors: *Ice, *Ice cover, *Strength of materials, *Mohr failure theory, Rivers, Lake ice, Failure(Mechanics), Theoretical analysis.

When the ice cover of rivers and inland waters is used for construction, exploration, and transportation, it is necessary to calculate its carrying capacity. Ice at any temperature fails as a brittle material. The equations given are applicable only at below-freezing ambient air temperatures. With the onset of thaw, the ice becomes weakened, and its carrying capacity is reduced. (Knapp-USGS)

CHARACTERISTICS OF SEA ICE, LAKE ICE AND PERMAFROST USING AN IMPULSE RADAR SYSTEM,
Geophysical Survey Systems, Inc., Worth Billerica, Mass.
C. L. Bertram, K. J. Campbell, and S. S. Sandler.
Available from NTIS, Springfield, Va 22161 as AD-772 549, Price $4.00 printed copy; $2.25 microfiche. Technical Report No 008-72, May 1972. 65 p, 33 fig, 3 tab, 7 ref. ONR Contract N00014-71-C-0392.

Descriptors: *Radar, *Ice, *Permafrost, Sounding, Instrumentation, Frozen ground, Frozen soils, Ice cover, Frost, Sea ice, Iced lakes, Surveys.

An impulse radar system was developed to perform shallow subsurface investigations. The technique, known as Electromagnetic Subsurface Profiling, is the electrical analog of the seismic subbottom profiling method used in marine geology. The radar system operates by detecting the interface between two materials having different electrical properties. For sea ice and lake ice, an electromagnetic pulse is generated near the ice surface and the reflections from the surface and the ice-water interface are displayed on a continuous strip-chart recorder. Travel times of the reflected pulses can be converted directly to ice thickness if the effective dielectric constant is known. Likewise, if the ice thickness is known the effective dielectric constant can be determined. Large masses of ground ice in permafrost have been located with the system. Theoretical considerations indicate that the system also should be able to determine the approximate volume of interstitial ice in frozen soils. (Knapp-USGS)

THE INTERDEPENDENCE OF LAKE ICE AND CLIMATE IN CENTRAL NORTH AMERICA,
Wolf Research and Development Corp., Riverdale, Md.
A. J. Jelacic.
Available from NTIS, Springfield, Va 22161 as E74-10149, Price $3.75 printed copy; $2.25 microfiche. Contract Report for Goddard Space Flight Center, December 1973. 27 p, 6 fig, 3 tab, 8 ref. NASA Contract NAS-5-21761.

Descriptors: *Lake ice, *Ice cover, *Freezing, *Climatology, *Remote sensing, Satellites(Artificial), Surveys, Meteorology, Synoptic analysis, Canada, United States, North America.

Correlations between the freeze-thaw cycles of lakes and regional weather variations were studied using ERTS 1 imagery of central Canada and north central United States. A comparison of lake freeze transition zone migration with the movement of large pressure centers revealed the following consistencies: (1) polar continental cyclones originate within and/or travel along the trend of the transition zone; (2) polar continental anticyclones fail to cross the transition zone, and (3) polar outbreak anticyclones pass through the transition zone, apparently unaffected. In addition, storm centers associated with the transition zone undergo significant intensification manifest by a deepening of the pressure through and increased precipitation outside the zone. HYDRAULIC INFLUENCES ON AUFEIS GROWTH,
R. F. Carlson, and D. L. Kane.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 165-175, 1973. 5 fig, 5 ref.

Descriptors: *Ice, *Alluvial channels, Freezing, *Alaska, Roads, Highways, Design, Surface-groundwater relationships, Groundwater movement.
Identifiers: *Icings, *Aufeis growth, *Naleds.

The hydraulic mechanism of aufeis growth is the result of a complex interaction of open channel, closed conduit, and groundwater flow. Results of a field measurement program on a small stream near Fairbanks, Alaska illustrate rapid and complicated fluctuation of hydrostatic head in the stream and the adjacent groundwater aquifer in conjunction with aufeis growth. A very important role is played by the adjacent groundwater aquifer as a storage reservoir. An understanding of the interaction of groundwater and streamflow is necessary for the development of design criteria where various transportation facilities intersect streams that have a potential for aufeis accumulation. SNOW-AIR INTERACTIONS AND MANAGEMENT OF MOUNTAIN WATERSHED SNOWPACK,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
J. R. Meiman, and L. O. Grant.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 825 $3.25 in paper copy, $2.25 in microfiche. Completion Report Series No. 57, Colorado Environmental Resources Center, Fort Collins, June 1974, 36 p. 3 fig, 6 tab, 11 ref, append. OWRT-B-073-Colo, 14-31-0001-3568.

Descriptors: Evaporation, *Snow management, Alpine, *Snowpack, *Cirques, Watershed management, Rocky Mountain region, Colorado, Avalanches, *Hydrologic budget.
Identifiers: *Colorado Front Range, Climax(Colo.), Pingree Park(Colo.), Induced avalanching, Cornice blasting.

Evaporation losses from mountain snowpacks amounted to approximately 60% of the snow season precipitation in an alpine setting and to approximately 45% in both a forest opening. Forest clearings similar to those studied should not result in greater snow evaporation losses if they are kept small enough to prevent wind transport of snow. Periodic removal of ridgeline snow deposits into the cirque below resulted in an increase of water yield equivalent to 240 acre-feet of water per mile of ridgeline treated. The estimated cost of the increased runoff was approximately $50 per acre-foot discharged from the cirques. A water-budget analysis of the alpine feeder area indicated that nearly 80% of the seasonal precipitation was transported out of the region by the end of the winter study period, 30 April. Only 23% of this total transport (18% of seasonal precipitation was caught in the natural cornice deposits along the ridgeline. It was shown that the cornice location is an inefficient place to store the windblown snow. Less than one-third of the winter storage in these ridgeline deposits was available for runoff. The remaining two-thirds was lost to either evapo-sublimation or late melt occurring after the runoff from the cirques had ceased. In the study area there is no carry-over of the ridgeline deposits into the next season. The water-budget analyses for the cirques indicated that nearly 75% of the water stored in the cirques during the winter period was realized as runoff during the melt period.

Alaska Univ., College. Geophysical Inst.
G. Wendler, and K. O. L. F. Jayaweera.
Journal of Geophysical Research, Vol 79, No 24, p 3478-3479, August 20, 1974. 1 fig, 1 ref. NOAA, sea-grant 04-3-158-41.

Descriptors: *Sea ice, *Remote sensing, *Surveys, *Velocity, Icebergs, Sea water, Satellites(Artificial), Data collections, Photography, Analytical techniques, Measurement, Evaluation, Movement.
Identifiers: *Norton Sound(Bering Sea).

A technique of using satellite imagery was presented so as to obtain without ambiguity the velocity vector of sea ice movement. The satellite imagery of the same area at two different times, i.e., a 24-hour difference was subtracted by superimposing a positive transparency of one and the negative of the other. Ice floes that have moved appeared on the resultant imagery twice, one lighter and one darker than the background. (Humphreys-ISWS)

EXPLANATION OF THE DAILY PATTERN OF WATER EVAPORATION FROM THE SOIL,
Zh.-D. Dandaron.
Soviet Hydrology: Selected Papers, No 1, p 77-85, 1973. 4 fig, 2 tab, 8 ref. Translated from GGI, Sbornik rabot po gidrologii, No 10, p 188-200, 1973.

Descriptors: *Evaporation, *Soil moisture, *Air-earth interfaces, *Diurnal distribution, Soil water movement, Soil surfaces, Hygroscopic water, Boundary processes, Diffusion, Temperature, Soil profile, Hydrologic equation, Hydrology, Fringe water, Soil temperature, On-site investigations, On-site tests, Soil investigations.
Identifiers: USSR.

An equation to compute the daily pattern of evaporation from the soil was obtained by solving a diffusion equation with allowance for sorption and desorption taking place during temperature changes in a dry layer formed at the soil surface. At the limit, when the thickness of the dry layer approaches zero, the equation leads to the formula of evaporation from the water surface (moist soil). Water evaporation from the soil represented a superposition of the diffusion flux, across the dry layer, of the vapor formed in deeper layers, and vapor formed or adsorbed in the dry layer as a result of desorption and sorption, respectively. The thickness of the dry soil layer was one of the most important parameters determining the daily evaporation pattern. With a thin dry layer, the evaporation pattern was determined mainly by the diffusion of vapor forming in the deeper soil layers. With a thick dry layer, the evaporation pattern was determined chiefly by sorption and desorption in this layer during periodic changes in soil temperature. The daily pattern of evaporation from the soil, computed by the equation agrees satisfactorily with the data from a hydraulic evaporimeter. (Humphreys-ISWS)

TREE WATER STRESS IN RELATION TO WATER YIELD IN A HARDWOOD FOREST,
New Hampshire Univ., Durham. Water Resource Research Center.
C. A. Federer, and G. W. Gee.
Available the from National Technical Information Service, Springfield, Va 22161 as PB-236 047, $3.25 in paper copy, $2.25 in microfiche. Research Report No 7, July 1974, 30 p, 1 fig, 1 tab, 12 ref. OWRT A-025-NH(3), 14-31-0001-3229.

Descriptors: *Stomata, *Transpiration, Microenvironment, Moisture deficit, *Deciduous forests, *Hardwood, Water yield improvement, *Energy budget, Xylem, *New Hampshire, Trees, Soil-water-plant relationships, Leaves.
Identifiers: *Ephemeral, Single-leaf energy balance.

Stomatal resistance, xylem potential, soil-water potential, stem diameter, net radiation, air temperature, humidity and wind were measured through a summer in a northern hardwood forest and on sunny and shady edges of clearings. Rainfall was about normal, and stomatal closure due to water stress occurred only as an ephemeral midday phenomenon. Yellow birch had lower diffusion resistance (2.5 sec/cm) than beech and sugar maple (3.0 and 3.4), implying possible transpirational differences. Diffusion resistance varied by species during leafout; it remained low in autumn until leaves turned color. Several trees were artificially stressed by preventing rain from reaching their roots; after two weeks stomata began to close early in the day, presumably limited transpiration and growth. The single-leaf energy balance was found to work on leaves in the canopy within the limits of measuring accuracy. Transpiration of trees on the edges of forest openings is probably greater than if there were no opening due to increased radiation and clothesline advection. A single large clearcut will reduce evapotranspiration more and provide greater water yield increase than cutting the same forest area in a number of smaller blocks.

EFFECT OF PARTIAL VEGETATION AND TOPOGRAPHIC SHADE ON RADIANT ENERGY EXCHANGE OF STREAMS--WITH APPLICATIONS TO THERMAL LOADING PROBLEMS,
Pennsylvania State Univ., University Park. School of Forest Resources.
D. R. DeWalle.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 073; $4.50 in paper copy, $2.25 in microfiche. Pennsylvania Institute for Research on Land and Water Resources, University Park, Research Publication Number 82, June 1974. 105 p, 16 figs, 11 tab, 17 ref. OWRT B-043-PA(1). 14-31-0001-3637.

Descriptors: *Solar radiation, *Thermal radiation, *Vegetation effects, Topography, *Water temperature, Streams, *Heat budget, *Thermal pollution, Model studies.

A model was developed and tested for estimation of the effects of partial vegetative and topographic shade on radiation exchange of streams. Theoretical shade effects on direct solar, diffuse solar, reflected solar, transmitted solar radiation, and both terrestrial and atmospheric longwave radiation were analyzed. Theoretical and measured downward allwave radiation flux densities compared favorably for a stream partially shaded by vegetation during four summer days. Theory and measurements were used to estimate daily and diurnal shade effects on radiation exchange of streams. Maximum shade-induced reductions in daily absorbed solar plus downward longwave radiation occurred for N-S stream azimuths, clear days, and large shade altitudes. Reductions were negligible on streams large enough to be sinks for waste heat, but could be significant on small streams especially if diurnal variations in radiation exchange were considered. Shade effects on heat dissipation from thermally-loaded streams were inferred from heat balance data.

FLOW VISUALIZATION USING A SELECTIVITY SENSITIVE FLUORESCENT DYE,
Aerospace Research Labs., Wright-Patterson AFB, Ohio.
D. R. Campbell.
Available from NTIS, Springfield, Va 22161 as AD-761 499, Price $3.00 printed copy; $2.25 microfiche. Air Force Aerospace Research Laboratories Report ARL 73-0075, May 1973. 8 p, 4 fig, 3 ref.

Descriptors: *Tracers, Flow, *Flourescent dye, *Tracking techniques.
Identifiers: *Flow visualization.

A technique of flow visualization produces the equivalence of smoke lines in water. The method consists of a fluorescent dye material, acting as a marker fluid, which is selectively responsive to ultraviolet light of a single wavelength. Under proper illumination, the dye provides a highly visible marker fluid, well suited to conventional photography. Under normal lighting conditions, the dye is colorless and optically noncontaminating. (Knapp-USGS)

SEQUENTIAL GENERATION OF STREAMFLOW,
Indian Inst. of Tech., New Delhi. Dept. of Civil Engineering.
S. K. Spolia, and S. Chander.

Water Resources Bulletin, American Water Resources Association, Vol 10, No 4, p 672-679, August 1974. 3 tab, 6 ref.

Descriptors: *Time series analysis, *Model studies, *Synthetic hydrology, Streamflow, Statistical methods, Hydrologic data, Analytical techniques, Correlation analysis, Probability, Average flow.
Identifiers: Residual series, Monthly streamflow, *India(Beas River).

An auto-regressive model was developed for hydrologic data simulation by transforming the observed monthly streamflows into a single residual series. The model developed was used for synthesizing 10 sequences, each of 100 year length, of monthly flows for the Beas River in India. The statistical parameters were calculated from the 49 year historical record of monthly streamflows. Sequences were also generated using the conventional auto-regressive model and an individual monthly streamflow series. A comparison of the sequences shows that the model developed and proposed in this paper is as good as the conventional auto-regressive model in preserving the mean and standard deviation of historical record. The proposed model requires less parameters than the conventional model for simulation of long-term dependence. (Singh-ISWS)

TWO-DISTRIBUTION METHOD FOR MODELING AND SEQUENTIAL GENERATION OF MONTHLY STREAMFLOWS,
Illinois State Water Survey, Urbana. Hydrology Section.
K. P. Singh, and C. G. Lonnquist.
Water Resources Research, Vol 10, No 4, p 763-773, August 1974. 6 fig, 2 tab, 21 ref.

Descriptors: *Synthetic hydrology, *Time series analysis, *Model studies, *Distribution patterns, Statistical methods, Streamflow, Hydrologic data, Analytical techniques, Correlation analysis, Probability, Computer programs, *Illinois.
Identifiers: Mixed distributions, *Sangamon River(Ill), *Two-distribution method, Random normal deviates, Sequential flow generation, Normal distribution, Pearson distribution.

Distributions of observed monthly streamflows at many gaging stations exhibit slight, moderate, or sharp reverse curvatures that cannot be accommodated by the commonly used classical distributions such as the normal and gamma (Pearson type 3) distributions applied to flows or their logarithms. The two distribution, essentially a bimodal distribution, fits most of these observed distributions very well. A unique and versatile method for modeling and sequential generation of monthly streamflows was presented. In order to assure the normality of the multivariate distribution of variables representing monthly flows, the flows or their logarithms were converted to standardized normal deviates by suitable transforms. The distributions of monthly streamflows generated by the two-distribution method fit best the observed flow distributions. Annual flows obtained by summing generated monthly flows fit the observed annual flows very well. The use of the two-distribution method can obviate arbitrary adjustments in generated monthly flows to bring the annual flows obtained from them in line with observed annual flows. (Singh-ISWS)

THE APPLICATION OF RIDGE REGRESSION ANALYSIS TO A HYDROLOGIC TARGET-CONTROL MODEL,
Wyoming Univ., Laramie. Dept. of Statistics and Atmospheric Resources.
D. A. Anderson, and R. G. Scott.
Water Resources Bulletin, American Water Resources Association, Vol 10, No 4, p 680-690, August 1974. 1 fig, 2 tab, 10 ref. DOI 14-06-D-6801.

Descriptors: *Regression analysis, *Statistical methods, *Least squares method, Hydrographs, Hydrologic data, Gaging stations, Analytical techniques, Variability, Estimating, *Wyoming.
Identifiers: *Wind River Range(Wy), *Ridge regression analysis, Regression coefficients.

The results of this study indicated not only improved stability of the regression estimates but also some improvement in predictive ability when ridge regression is used instead of ordinary regression analysis. In situations where the independent variables in a model are highly correlated with each other, ordinary regression analysis is not usually satisfactory. With nonorthogonal data, the least squares estimates obtained using the regression techniques are subject to large errors and instability. In 1970, Hoerl and Kennard proposed the ridge regression analysis to control the instability of least squares estimates. This analysis is based on decreasing the mean square error of the regression coefficients rather than on a minimum residual sum of squares for the ordinary regression analysis. A detailed computational procedure was presented for obtaining the ridge regression estimates. The proposed analysis has been used to investigate the stability of regression coefficients over 23 years of data collection from several control stations for estimating the streamflow at two target stations. The ordinary regression analysis yielded positive and negative regression coefficients, but the ridge regression analysis gave only positive regression coefficients. The regression coefficients were very nearly the same for different sets of years using the ridge regression analysis. (Singh-ISWS)

PROCEDURES FOR FILLING GAPS IN HYDROLOGIC EVENT SERIES,
Pennsylvania State Univ., Harrisburg. Dept. of Civil Engineering.
G. Aron, and T. M. Rachford.
Water Resources Bulletin, Vol 10, No 4, p 719-727, August 1974. 5 fig, 5 tab, 2 ref.

Descriptors: *Synthetic hydrology, *Analytical techniques, *Flood frequency, Simulation analysis, Statistical methods, Floods, Statistics, Hydrologic data, Surface waters, Hydrology, Flood data, Annual flood, Flood discharge, Regression analysis.
Identifiers: Missing data, Beard's formula, Extending records.

Various methods for synthesizing missing records of floods were compared. Record gaps may be the result of a temporary interruption of gaging activities at the particular site or may constitute the years prior to the installation of a permanent gage, during which a few isolated measurements of exceptional flood stages were made. The rank adjustment method was used to compute synthetic floods when concurrent records were absent from gauges located on the same stream or a nearby watershed. For concurrent data available at two hydrologically related stream gauges, synthetic floods were computed by regression analysis and the rank matching method. It was recommended that regression analysis be used if the series were processed in a form ready for computer analysis. The rank matching method can be applied quickly without any statistical analysis and could be used with little loss in realiability if hand tabulation and plotting are used in the flood analysis. It may also be possible to obtain better results with the rank matching method by interpolating according to the geometric mean, or by a weighted interpolation of several adjacent flows, or some other scheme, but only with the penalty of additional computational effort. (Humphreys-ISWS)

TRANSVERSE MIXING IN AN ICE-COVERED RIVER,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
J. E. O. Engmann, and R. Kellerhals.
Water Resources Research, Vol 10, No 4, p 775-784, August 1974. 7 fig, 4 tab, 16 ref, 1 append.

Descriptors: *Mixing, *Ice cover, *Tracers, Fluorescent dye, Streamflow, Hydraulics, Flow characteristics, *Canada.
Identifiers: *Transverse mixing, *Alberta(Lesser Slave River), Velocity measurements, Meandering channels.

Two tracer tests were conducted in Lesser Slave River in Alberta under similar conditions of flow depth, one under ice and the other under open water. Average transverse exchange (or mixing) coefficients for a reach were computed using a curvilinear coordinate system and the moments technique of Aris. The normalized exchange coefficient for ice-covered conditions was found to be approximately 50% smaller than the corresponding coefficient for open water conditions. Since ice cover reduces the product of friction velocity and hydraulic radius by a factor of approximately 2.83 if depth remains constant, these results indicated that ice cover can substantially reduce the mixing capacity of a river. The importance of depth and width variations in the computation of mixing coefficients was discussed and demonstrated. Bend-induced spiral motions appeared to delay vertical mixing until transverse mixing was completed. (Adams-ISWS)

THE KERNEL FUNCTION OF LINEAR NONSTATIONARY SURFACE RUNOFF SYSTEMS,
Technion - Israel Inst. of Tech., Haifa. Faculty of Civil Engineering.
M. H. Diskin, and A. Boneh.
Water Resources Research, Vol 10, No 4, p 753-761, August 1974. 9 fig, 2 tab, 11 ref.

Descriptors: *Surface runoff, *Hydrographs, *Optimization, *Storms, Base flow, Rainfall-runoff relationships.
Identifiers: *Linear nonstationary model, *Stationary linear model, *Kernel function, Impulse response functions, Discretization scheme, Independent subsets, Natural watersheds, Convolution integral, Cache River at Forman.

Representation of surface runoff systems by a nonstationary linear model gave a closer fit to a set of observed direct surface runoff hydrographs than representation by a stationary linear model. The kernel of this model, which is a function of two time variables, was considered to be an assembly of impulse response functions for unit pulses acting at various time intervals after the beginning of the storm. Each of these impulse

response functions must have the properties of an ordinary instantaneous unit hydrograph. The kernel function was evaluated by an optimization procedure based on a discretization scheme for the functions involved. The set of equations for the unknown kernel values was partitioned into independent subsets, each of which was solved individually. The complete equation set needs consideration only when area constraints of the kernel function are imposed. (Bhowmik-ISWS)

A SUBSURFACE RIBBON OF COOL WATER OVER THE CONTINENTAL SHELF OFF OREGON,
Oregon State Univ., Corvallis. School of Oceanography.
A. Huyer, and R. L. Smith.
Journal of Physical Oceanography, Vol 4, No 3, p 381-391, July 1974. 9 fig, 1 tab, 29 ref. NSF Grants GX-28746 and GX-33502.

Descriptors: *Oregon, *Continental helf, *Ocean currents, *Surveys, Oceans, Oceanography, Pacific Ocean, Upwelling, Hydrography, Exploration, On-site data collections, Temperature, Salinity, Evaluation.
Identifiers: Coastal upwelling experiment.

Observations of the hydrographic regime over the continental shelf off Oregon from the R/V Yaquina during the summer of 1972 showed the presence of an alongshore, subsurface ribbon of relatively cool water. Its properties and its evolution during the 1972 season were described. Examination of earlier observations showed that evidence of the ribbon was found during the upwelling season in almost every year between 1961 and 1971. It was usually observed when the upwelling index (the monthly mean Ekman transport directed offshore) was high. The ribbon can be accounted for by southward advection of subarctic water due to the coastal jet associated with upwelling. A warm temperature anomaly, occurring at somewhat higher salinity, was frequently observed inshore of the ribbon. (Humphreys-ISWS)

LAGRANGIAN MEASUREMENTS IN A COASTAL UPWELLING ZONE OFF OREGON,
Inter-American Tropical Tuna Commission, La Jolla, Calif.
M. R. Stevenson, R. W. Garvine, and B. Wyatt.
Journal of Physical Oceanography, Vol 4, No 3, p 321-336, July 1974. 13 fig, 5 tab, 13 ref. NSF Grant GX-32211.

Descriptors: *Oregon, *Coasts, *Upwelling, *Ocean currents, *On-site investigations, Ocean circulation, Oceanography, Hydrography, Temperature, Salinity, Measurement, Evaluation.
Identifiers: *Upwelling circulation, Lagrangian measurements, Coastal upwelling experiment.

During August 1972 drogue and hydrographic measurements were made in the coastal upwelling zone off the Oregon coast. The study was conducted as a component of the Coastal Upwelling Experiment (CUE-1). Both sub-surface parachute drogues and surface vane drogues were tracked for two periods. The one experiment began as the strong prevailing northerlies that drive the summer upwelling began after a cessation of 11 days. A new cycle of upwelling appeared to begin with progressive upwarping of the pycnocline inshore and the generation of strong surface equatorward motion. The other experiment coincided with the abrupt relaxation of strong northerlies and appeared to represent the onset of the decay phase of the upwelling circulation. The pycnocline broke the sea surface about 5 km from shore creating a highly convergent front which drew in the surface vane drogues. A strong sub-surface temperature inversion appeared to be related to intense sinking of surface water at the front. The onshore motion of drogues at 50 m depth gave evidence of persistent upwelling, despite the wind relaxation. A conceptual model of the two phases of upwelling circulation observed was presented. Descriptors: *Water circulation, *Sea water, *Radioactive dating, Carbon radioisotopes, Currents(Water), Advection, Stratification, Thermocline, Dissolved oxygen, Density stratification.
Identifiers: *Black Sea.

Radiocarbon data from the deep water of the Black Sea indicate a mean residence time of the water of 935 years. It is proposed that about half of the inflow from the Mediterranean is advected to the surface and only half of it participates in forming the deep water. Bottom waters are 2,000 plus or minus 200 years old. (Knapp-USGS)

THE SHALLOW FRESH-WATER SYSTEM OF SANIBEL ISLAND, LEE COUNTY, FLORIDA, WITH EMPHASIS ON THE SOURCES AND EFFECTS OF SALINE WATER,
Geological Survey, Tallahassee, Fla.
D. H. Boggess.
Florida Bureau of Geology, Tallahassee Report of Investigation No 69, 1974. 52 p, 23 fig, 2 tab, 3 ref.

Descriptors: *Surface-groundwater relationships, *Hydrogeology, *Florida, *Saline water intrusion, Water resources, Water quality, Hydrologic data, Data collections, Artesian aquifers.
Identifiers: *Sanibel Island(Fla).

The freshwater system of Sanibel Island, Florida, includes the water-table aquifer and the hydraulically connected surface network of streams, ponds, lakes, and canals in the interior of the island. Beneath the water-table aquifer, a shallow artesian aquifer occurs at depths ranging from about 29 to 34 feet below land surface and probably extends to depths of more than 100 feet. Within the shallow artesian aquifer, water levels respond to the loading and unloading of tides in the Gulf of Mexico. The tidal efficiency of wells tapping this aquifer range from about 10% to 77%. Chloride concentrations in the water-table aquifer range from 12 to 23,200 milligrams per liter; concentrations are highest in or adjacent to the salt-marsh areas along the north half of the island. Within the shallow artesian aquifer, the chloride concentrations range from 2,250 to 30,900 mg/liter; concentrations are highest under the north half of the island. Most of the problems caused by intrusion of saline water into the interior freshwater system can be resolved. The inland movement of saline water through the Sanibel River from adjacent tidal water bodies could largely be averted if the control structures were modified to prevent being topped by high tides. Dewatering of excavations should be restricted to those areas where no freshwater occurs within the water-table aquifer. Excavations should be limited

to depths which will not improve the hydraulic connection between the water-table and shallow artesian aquifers. All wells or test holes which penetrate any of the artesian aquifers should be plugged with cement after serving their purpose. (Knapp-USGS)

TRACING SHALLOW GROUNDWATER SYSTEMS BY SOIL TEMPERATURES,
Illinois State Geological Survey, Urbana.
K. Cartwright.
Water Resources Research, Vol 10, No 4, p 847-855, August 1974. 9 fig, 23 ref.

Descriptors: *Illinois, *Groundwater movement, *Soil temperature, *Heat flow, Dishcarge(Water), Recharge, Aquifer characteristics, Glacial aquifers, Flow system.
Identifiers: *Temperature profiles, Temperature surveying, Heat modeling.

Circulating water is known to affect the temperature of the rock through which it flows. Analysis of existing theoretical equations suggests that shallow groundwater flow will also affect the surface soil temperature. Soil temperatures therefore might be used to delineate small, shallow groundwater flow systems; both recharge and discharge zones might be distinguished. Temperature data taken in the field during summer and winter support these theoretical conclusions and agree with the groundwater flow patterns inferred from hydrologic data. In general, winter soil temperature profiles have less data scatter than profiles of summer temperatures. The greater the rate of groundwater flow, the greater the temperature difference between recharge and discharge zones. Temperature variations ranged from 0.75C in clayey glacial till to 5C in sand. The effect on soil temperature also decreases with increasing horizontal distance between the recharge and the discharge zone. The effect of horizontal flow in a shallow confined aquifer is also predictable from theoretical models and can be shown by field studies. The amount of heat redistributed depends on the thermal properties of the aquifer and on overburden and the velocity of fluid flow. (Gigg-ISWS)

IDENTIFICATION OF PARAMETERS IN AN INHOMOGENEOUS AQUIFER BY USE OF THE MAXIMUM PRINCIPLE OF OPTIMAL CONTROL AND QUASI-LINEARIZATION,
California Univ., Los Angeles. Dept. of Systems Engineering.
A. C. Lin, and W. W-G. Yeh.
Water Resources Research, Vol 10, No 4, p 829-838, August 1974. 3 fig, 3 tab, 13 ref, 1 append. UCAL-WRC-W-290.

Descriptors: *Aquifer characteristics, *Diffusivity, *Optimization, *Linear programming, *Least squares method, Mathematical studies, Parametric hydrology, Mathematics, Observation wells, Wells, Groundwater, Computer models, Aquifers.
Identifiers: *Inverse problem, *Maximum principle optimization, Quasi-Linerization, Parameter identification, Finite differences, Unconfined aquifer, Numerical example.

Optimal identification of aquifer parameters in a distributed system was formulated as an optimal control problem. The dynamics of the head was governed by a second-order nonlinear partial differential equation. The numerical example presented considers that the parameters to be identified were functions of the space variable. Observations on head variations were available at several observation wells distributed within the system. Spatial discretization was first used to transform the distributed system to a lumped system. The least squares criterion function was then established. After introducing the Lagrange multipliers, the maximum principle was applied to obtain the set of necessary conditions that is optimal. These conditions were expressed in terms of a set of canonic equations of two-point boundary value type that is easily solved by the technique of quasi-linearization. Thus aquifer parameters were directly identified on the basis of observational data taken at observation stations. The maximum principle formulation is inherently more accurate and stable, since it minimizes the least squares error over the whole time and space domains. Computationally, it is extremely efficient. The numerical example presented demonstrates simultaneous identification of 11 parameters defined at discretized points along the space variable. Quadratic convergence was also demonstrated by numerical experimentation. (Prickett-ISWS)

PIPE FLOW MODELS OF A KENTUCKY LIMESTONE AQUIFER,
Kentucky Univ., Lexington. Dept. of Geology.
J. Thrailkill.
Groundwater, Vol 12, No 4, p 202-205, July-August 1974. 3 fig, 1 tab, 12 ref.

Descriptors: *Groundwater movement, *Computer models, *Aquifers, *Surface groundwater relationships, *Limestones, Hydrologic properties, Darcys Law, Transmissivity, Carbonate rocks, Water table, Springs, *Kentucky.
Identifiers: Sinkhole Plain(Ky), Green River(Ky), Little Barren River(Ky), Pipe network model, Groundwater modeling, Barren River(Ky).

A digital computer program which simulates a limestone aquifer as a pipe network was written and compared with the Sinkhole Plain aquifer of west-central Kentucky. Model 1, which considers the flow in the network to be laminar, yielded values of head, flow in the network, and discharge at the bounding streams which are in reasonably good agreement with field observations. The overall hydraulic conductivity of the aquifer appears to be about 5600 meinzers if the zone of active flow is 30 meters thick, but the northeastern portion of the aquifer probably has a higher transmissivity. The indicated location of the principal groundwater divide agrees well with data derived from wells and from tracing undergroundwater flows. A second model (Model 2) was constructed which considers flow in the network to be turbulent. Although this model yields values which differ from Model 1, the differences are too small to allow the mode of flow in the aquifer to be distinguished using observational data. (Sanderson-ISWS)

NATURAL LONG-PERIOD GROUNDWATER LEVEL FLUCTUATION,
V. S. Kovalevskiy.
Soviet Hydrology: Selected Papers, No 1, p 38-50, 1973. 10 fig, 1 tab, 18 ref. Translated from Vodnyye Resursy, No 1, p 161-177, 1973.

Descriptors: *Water level fluctuations, *Water table, *Hydrogeology, *Forecasting, Variability, Groundwater resources, Groundwater, Hydrology, Projections, Frequency.
Identifiers: *USSR.

The periodicity patterns examined led to the conclusion that there is a considerable regional irregularity in the natural groundwater recharge over a long period. This must unavoidably be reflected in river recharge and in the general hydrologic budget of the USSR. The inertia of groundwater runoff results in the redistribution of variations in groundwater recharge with time. Groundwater plays a definite regulating role in the general hydrologic cycle of the earth. Yet, the periodicity of groundwaters shows that they are an inseparable part of the hydrosphere of the earth whose regime must be analyzed by unified methods and as a whole. Observed groundwater level fluctuations for selected wells and curves of the groundwater levels forecast for individual regions of the USSR were presented. (Humphreys-ISWS)

METHOD FOR COMPUTING NORMAL GROUNDWATER DISCHARGE INTO SMALL RIVERS,
B. M. Dobroumov.
Soviet Hydrology: Selected Papers, No 1, p 66-70, 1973. 3 fig, 2 tab, 3 ref. Translated from GGI, Sbornik rabot po gidrologii, No 10, p 89-96, 1970.

Descriptors: *Base flow, *Surface-groundwater relationships, *Groundwater basins, *River flow, Groundwater, Subsurface waters, Regions, Discharge(Water), Groundwater resources, Drainage area, Watersheds(Basin), Hydrologic equation, Hydrology.
Identifiers: *USSR(Central Chernozem Regions), Small rivers.

Groundwater inflow to rivers was determined by separating total river runoff hydrographs into surface and subsurface components. Hydrogeological regionalization of the Central Chernozem Regions and determination of long-period mean groundwater inflow rates to rivers made it possible to construct curves of the groundwater discharge rate as a function of river basin area for each region. Maps of hydroisohypses showed that the surface and subsurface drainage basins coincide over most of the region under study. The largest drainage areas reported for which a river can be regarded as small were determined from these curves. Annual values of groundwater inflow rate to small rivers was reported equal to a times the river basin F raised to the n power, where a and n are regional parameters. Reported values for a varied from 0.000008 to 0.00085 and from 1.02 to 1.49 for n. Relationship was not recommended for river basin areas less than 100 sq km. (Humphreys-ISWS)

INTEGRODIFFERENTIAL EQUATIONS FOR SYSTEMS OF LEAKY AQUIFERS AND APPLICATIONS 2. ERROR ANALYSIS OF APPROXIMATE THEORIES,
Universidad Nacional Autonoma de Mexico, Mexico City. Centro de Investigacion en Matematicas Aplicadas y Sistemas.
I. Herrera.
Water Resources Research, Vol 10, No 4, p 811-820, August 1974. 2 fig, 1 tab, 17 ref, 1 append.

Descriptors: *Aquitards, Drawdown, Storage capacity, Permeability.
Identifiers: *Confined aquifer, *Vertical flow, *Leaky aquifer systems, *Error analysis.

This paper is the second of a series devoted to developing a method of analysis based on the integrodifferential equations of leaky aquifer systems. In part 1 (Herrera and Rodarte, 1973a) (W73-13378) the integrodifferential equations were derived, and an interpretation for some of the approximate theories was given in terms of the memory functions occurring in the equations. The same equations are quite suitable for a systematic analysis of the errors involved, and therefore in this paper they are used to carry it out. (Schicht-ISWS)

Available from Sup Doc GPO, Washington, DC 20402, Price $5.00. Professional Paper 486-G, 1973. 130 p, 37 fig, 6 plate, 14 tab, 53 ref.

Descriptors: *Water resources, *Arizona, *California, *Groundwater, *Hydrogeology, Alluvium, Surface-groundwater relationships, Colorado River basin, Irrigation water, Hydrologic data, Water yield, Transmissivity.
Identifiers: Parker-Blythe-Cibola area(Calif-Ariz).

An investigation of the groundwater resources of the Parker-Blythe-Cibola area, Arizona and California, began in 1960 as a part of the Lower Colorado River Project (LCRP). The area extends from Davis Dam south along the valleys of the Colorado River to the international boundary and to Coachella and Imperial Valleys. The geologic units that are important in water resources are the Miocene fanglomerate, the Bouse Formation, and the alluvium of the Colorado River and its tributaries. The fanglomerate is a potentially important aquifer. Throughout most of the area, wells in the Bouse Formation will yield very limited quantities of water. Most of the wells in the area yield water from the Colorado River alluvium. Wells that tap a sufficient thickness of these gravels have specific capacities larger than 100 gpm per foot of drawdown. The Colorado River recharges the aquifers both directly and indirectly by infiltration of irrigation water. The pattern of water-level fluctuations is a combination of the effects of changes in river stages, irrigation, and consumptive use. Rarely does the resultant effect exceed 3 feet. Transmissivities range from less than 100 to a high of 700,000 gallons per day per foot. Except where the water has been freshened as a result of irrigation, much of the shallow groundwater is of relatively poor quality. Water in the river and in the alluvium generally contains between 650 and 800 milligrams per liter dissolved solids; sulfate is the predominant constituent. (Knapp-USGS)

TIDAL FLUCTUATIONS OF WATER LEVELS IN WELLS IN CRYSTALLINE ROCKS IN NORTH GEORGIA,
J. W. Stewart.
Geological Survey Research, Article 46, 1961. p B-107-B-109, 1 fig, 1 ref.

Descriptors: *Groundwater, Water wells, *Crystalline rocks, Tides, Diurnal, Metamorphic rocks, Saprolites, Beds(Stratigraphic), Folds(Geologic), Permeability, Weathering, Clays, Silts, Cracks, Confined water schists, Hydrology, *Georgia, *Tidal effects, *Water level fluctuations.
Identifiers: Lunar cycle.

The semidiurnal water-level fluctuations of a tidal period were observed in wells in metamorphic crystalline rocks during a geologic and hydrologic study at the Georgia Nuclear Laboratory in Dawson County, Ga. The following evidence indicates that the semidiurnal fluctuations of water levels are the result of earth tides produced by the attraction of the moon and sun: (1) two daily cycles of water-level fluctuations occur in the wells, about 50 minutes later each day; (2) the close agreement of the average daily retardation of the peaks and troughs in the wells with that of the average daily retardation of the moon's transit; (3) the occurrence of regular fluctuations of maximum amplitudes during periods of new and full moon and irregular fluctuations of minimum amplitudes during periods of the first and last quarters of the moon; and (4) the coincidence of the lowest water levels in wells with that of the moon's transit at upper and lower culmination. HYDROLOGICAL REGIME OF LOWER DNIEPER SANDS IN CONNECTION WITH THEIR AFFORESTATION, (IN RUSSIAN),
V. N. Vinogradov.
Dokl Vses Ord Lenina Akad S-Kh Nauk Im V I Lenina. 2, p 37-40, 1973. Illus.
Identifiers: Fluctuations, *Reforestation, Percolation, Sands, *USSR(Dnieper River).

Massive pine plantings affect the hydrological regime just as herbaceous vegetation of overgrown areas. Afforestation of the latter does not introduce marked changes into the total regime of groundwaters. The groundwaters of the near-water sands of the region belong to the desorptive-corrective type which undergo spring-summer-fall desorptive lowering and fall-winter-spring percolation corrective rise. A special feature is the presence of a winter corrective rise due to mild winters and prolonged thaws.--Copyright 1973, Biological Abstracts, Inc.

THE ANSWER OF THE SOIL GENETIC CRITERIA TO THE QUESTION OF THE FUNCTION AND DURABILITY OF AMELIORATING SUB-SOILING OF PSEUDOGLEY,
Institut National de la Recherche Agronomique, Tunis (Tunisia).
E. Kopp.
Z Kukturtech Flurbereinig. Vol 13, No 5, p 272-278, 1972. (English summary).
Identifiers: *Pseudogley, *Soil surveys, *Subsoiling, *Tillage.

Comparative soil surveys, cartography, physical measurements of different old drainage ditches and archeological layouts showed that under certain conditions, a constant mellowing can be reached. Condensations are soil-physically favorable structures, a product of certain age and of specific soil dynamic processes. Subsoiling or deep tillage are actions which artificially influence the buffer system of the soil. Effects of unchangeable but fossil processes are neutralized and adapted to actual conditions of soil structure. Adequate deep tillage and accessory actions will transform soils which are not adapted to modern environmental conditions, and for centuries, these soils will regain unfavorable physical condition.--Copyright 1973, Biological Abstracts, Inc.

PRIMARY CHECKING OF DATA ON MOISTURE RESERVES IN SOIL WITH ELECTRONIC COMPUTERS, (IN RUSSIAN),
V. A. Zhukov.
Tr Inst Eksp Meteorol Gl Upr Gidrometeorol Sluzhby Pri Sov Minist SSSR. 13, p 57-65, 1970.

Identifiers: Computers, *Soil moisture, *USSR(Belorussia), Crops, Soil horizons, *Data collections.

The paired coefficients of correlation (r) between moisture reserves under winter crops in different soil horizons were calculated on the basis of a large volume of information on the reserves of available moisture in different soils of the Belorussian SSR. The correlation between the moisture reserves in the individual 10 cm horizons is clearly traced in the upper 60-cm layer. The moisture reserves in the 50-60-cm layer are well correlated with the moisture in the 90-100 cm layer (r=0.69). The correlation between the moisture reserves in the 10-cm soil layers was used to construct statistical schemes of the primary check in the form of the control W(j-1)-j=EWj(j-2)-(j-1)+Cj, where W (j-1)-j is the estimate of moisture reserves in the soil layers 10-20, 20-30,....,90-100 cm- W(j-2)-(j-1), represents the actual moisture reserves of the soil in the layers 0-10, 10-20,..., 80-90 cm; Ej, coefficient of regression; Cj, free term of the equation. It is possible to use computers for checking if errors exceeding certain permissible limits have been detected.--Copyright 1973, Biological Abstracts, Inc.

CONTRIBUTIONS TO THE KNOWLEDGE OF TISSA PLAIN PSEUDOGLEY SOILS, (IN RUMANIAN),
Institutul de Studii si Cercetari Pedologie, Bucharest (Rumania).
I. Munteanu, G. Babos, P. Vasilescu, A. Conescu, and M. Munteanu.
Annales Inst Stud Cercet Pedol. 39, p 259-279. 1971. Illus. English summary.
Identifiers: Albaqualf, Pedogenesis, Plains, Planosol, *Pseudogley soil, *Romania(Tissa plain), Soils, *Soil types, *Soil classification.

Pseudogley soils of the Tissa plain (Romania) develop in the oak forest zone in areas having a flat or slightly inclined position (terraces or piedmont, slightly dissected plains), covered with fine deposits with over 45% of the fractions less than 0.002 mm. Average annual temperature ranges between 10.3 deg - 10.9 deg, while the average annual rainfall ranges between 600-760 mm, important seasonal, contrasting moisture values are frequently noted. In connection with fine texture of parental material (and probably with the climate), the argilluviation process is accompanied by the appearance of features characteristic to plansols, i.e.: an upper, strongly bleached and clay-impoverished horizon, an abrupt change of texture and a Bt horizon strongly enriched in fine fractions. Two groups of pseudogley soils may be noted as a function of argilluviation intensity: slightly and moderately 'lessive' pseudogley and 'lessive' pseudogley soils. Soils possessing a texture differentiation index of 1.7-1.9, a moderate debasification (V = 53-74%) and a moderately-weak acid reaction (pH = 5.4-6.1) are included in the first group. The second group includes soils with texture differentiation indexes exceeding 2.5(2.5-3.2), dominantly oligomesobasic (V = 45-56% or even 30%) and possessing a moderately - strong acid reaction (pH = 5.0-5.7). Variation of free iron/total iron and free iron/clay (less than 0.002 mm) ratios in the soil profile evidences a relative accumulation of the free-iron in the upper horizon -- a specific feature of these soils. Chemical analysis of clay fraction less than 0.01 mm shows an increase in the ratio SiO2/R2O3 from 2.7 in the elluvial horizon, to 3.04 in the illuvial one. The Tissa plain pseudogley soils may be regarded as hydromorphic clay -- illuvial soils (Stagnohydromorphic). The main part of pseudogley soils are classified, according to FAO classification, as planosols (entric and dystric-entric), while in the American classification, these soils are found under Albaqualf soils (mostly typical and some vertic).--Copyright 1974, Biological Abstracts, Inc.

WATERPROOFING SURFACE-ZONE SOIL AGGREGATES FOR WATER CONSERVATION,
Hebrew Univ., Rehovot (Israel). Faculty of Agriculture.
D. Hillel, and P. Berliner.
Soil Science, Vol 118, No 2, p 131-135, August 1974. 3 fig, 12 ref.

Descriptors: *Soil sealants, *Laboratory tests, *Water conservation, *Soil profiles, *Waterproofing, Coatings, Soil analysis, Hydraulic models, Evaporation control, Water resources, Soil tests, Soil management, Infiltration, Soil moisture, Soil treatment, Retention, Soil profiles, Percolation.
Identifiers: *Israel(Malkia-Upper Galilee), Terra-rossa clay loam.

Layers of silicone-treated soil aggregates of various depths and size classes were tested in laboratory columns to determine their effect upon the processes of water intake and evaporation. The results showed that the presence of a top layer of hydrophobic aggregates can either decrease or increase infiltrability, depending on the sizes of the aggregates, which determine the effective diameters of the interaggregate voids. If the aggregates are sufficiently large, a top layer of hydrophobic aggregates can readily transmit water downwards even while the aggregates themselves remain dry. A secondary consequence of this effect is the prevention of slaking or crust formation, which often inhibits infiltration. The presence of a top-layer of hydrophobic aggregates had a marked effect in reducing evaporation, the magnitude of this reduction again depending on the sizes of the aggregates and the depth of the aggregated layer. Aggregate-size classes were 0.2-0.5 mm, 0.5-1 mm, 1-2 mm, 2-5 mm. Waterproofing surface-zone soil aggregates appeared to be a promosing approach to soil water conservation, and must be tested in the field. (Humphreys-ISWS)

THE ROLE OF OXYGEN IN NITROGEN LOSS FROM FLOODED SOILS,
Louisiana State Univ., Baton Rouge.
W. H. Patrick, Jr., and S. Gotoh.
Soil Science, Vol 118, No 2, p 78-81, August 1974. 3 fig, 1 tab, 5 ref. EPA Project R-800428.

Descriptors: *Soil science, *Laboratory tests, Oxygen requirements, *Nitrification, Soil analysis, Aerobic conditions, Oxygen, Nitrogen, Oxidation, Denitrification, Nitrates, Nitrogen cycle, Soil surfaces, Soil chemistry.
Identifiers: *Flooded soils, Crowley silt loam soil.

The concentration of atmospheric 02 over a flooded soil was a factor in determining the amount of N lost by denitrification. Large increases in N loss occurred from the first few increments of oxygen with little further loss occurring above 20 percent 02. The thickness of the aerobic layer was also governed by the amount of 02 in the air. Nitrogen loss was generally related to the thickness of the aerobic layer, even though appreciable loss occurred at 5 and 10 percent 02 where the aerobic layer was relatively thin. (Humphreys-ISWS)

DETERMINATION OF DISPERSION AND NONLINEAR ADSORPTION PARAMETERS FOR FLOW IN POROUS MEDIA,
Purdue Univ., Lafayette, Ind. School of Chemical Engineering.
S. P. Gupta, and R. A. Greenkorn.
Water Resources Research, Vol 10, No 4, p 839-846, August 1974. 10 fig, 3 tab, 19 ref.

Descriptors: *Dispersion, *Adsorption, *Porous media, Groundwater movement, Permeability, Isotherms, Nitrates, Phosphates.
Identifiers: *Linear equilibrium adsorption, Freundlich equilibrium adsorption, Linear superposition, Breakthrough curves, Reynolds number.

Ottawa washed sand mixed with 0.0-7.5% kaolin clay was used to determine dispersion and nonlinear adsorption parameters during flow through porous media. The ions considered were nitrate for the nonadsorbing species and phosphate for the adsorbing species. A one-dimensional linear model with a longitudinal dispersion coefficient was used, and the dispersion coefficient was determined by least squares fit. The dispersion coefficients were correlated with dispersivity models based on kinematic viscosity and powers of velocity and Reynolds number. The velocity exponent seemed independent of clay content, whereas the model coefficients increased approximately linearly with clay content. The static adsorption data suggest a Freundlich isotherm. The principle of linear superposition was assumed for dipersion and adsorption to estimate the dynamic parameters. The adsorption parameter for the linear model was approximately linear with clay content. The two adsorption parameters for the nonlinear model were highly correlated and cannot be estimated simultaneously from dynamic measurements alone. The linear model described the movement of phosphate ions adequately for the medium considered. However, for a natural system in which clay content is high and phosphate ion concentration is low one would expect better data from the generalized nonlinear model. (Visocky-ISWS)

Soil Science, Vol 118, No 2, p 120-126, August 1974. 3 fig, 2 tab, 10 ref. NIEHS Grant ES 00040, USDI Grant B-001-ORE.

Descriptors: *Dispersion, *Diffusion, *Sorption, Porous media, Voids.
Identifiers: *2,4-dichlorophenoxyacetic acid, *Chemical transport, Pore radii, Glass beads, Breakthrough curve.

Dispersion profiles of 2,4-dichlorophenoxyacetic acid were measured experimentally to evaluate a theoretical dispersion model previously developed by the investigators and to evaluate the effect of pore size on dispersion. The chemical being dispersed along a column made up of glass beads was initially present only in the pore water of a 1 cm long section at the front of the column. After leaching for a period of time, the column was sectioned and the concentration in each section was obtained and compared with a predicted concentration. Four porous media systems consisting of glass beads with particle diameters of less than 30, 28-53, 105-149, and 149-210 millimicrons obtained by dry sieving were used. Corresponding predominant pore radii were 4.5, 8.2, 19.5, and 36.2 millimicrons. The corresponding dispersion coeffi-

cients were found to be 0.53, 0.69, 1.41, and 2.05 sq cm/day, respectively. Using these values, theoretical dispersion profiles were calculated. The theoretical distributions of the chemical in the columns were found to be in good agreement with the experimentally determined distributions. The values of the dispersion coefficients could be related to pore size, diffusion coefficient, and flow rate. (Visocky-ISWS)

LATERAL MOVEMENT AT THE PERIPHERY OF A ONE-DIMENSIONAL FLOW OF WATER,
Connecticut Agricultural Experiment Station, New Haven. Dept. of Ecology and Climatology.
N. C. Turner, and J. Y. Parlange.
Soil Science, Vol 118, No 2, p 70-77, August 1974. 5 fig, 11 ref.

Descriptors: *Soil water movement, *Soil physical properties, *Infiltration, Recharge, Diffusivity, Moisture content.
Identifiers: Double ring infiltrometer.

An approximate analytical solution for the lateral movement at the periphery of a one-dimensional flow of water without gravity was derived for a source that is a semi-infinite plane. The solution was shown to be valid experimentally for relatively long times for a source with finite length. The theory can be utilized to calculate, and correct for, the additional infiltration due to lateral movement in measurements of water intake in the field; when gravity was present, however, the correction was valid only for short times. TWO-DIMENSIONAL SEEPAGE IN LAYERED SOIL--DESTABILIZING EFFECTS OF FLOWS WITH AN UNSTEADY FREE SURFACE,
State Univ. of New York, Stony Brook.
D. Dicker, and D. K. Babu.
Water Resources Research, Vol 10, No 4, p 801-809, August 1974. 5 fig, 8 ref, 1 append.

Descriptors: *Soil stability, *Seepage, *Unsteady flow, *Free surface, *Landslides, Groundwater, Soil pressure, Soil water, Soil water movement, Soil moisture, Soil investigations, Soil mechanics, Soil properties, Mathematical studies, Mathematics, Mathematical models.
Identifiers: *Layered soils, *Perturbation techniques, Soil slope, Prolonged rainfall effects, Heterogeneous porous media.

An analytic study was made about the destabilizing effects of a prolonged rainfall over the sides of a long symmetric hill. The assumptions underlying the analysis were (1) the soil consisted of layers parallel to the hillslope, (2) the flow domain was bounded from below by an unknown free surface, and (3) this free boundary moves downward with passage of time. The resulting flow pattern was therefore time dependent. The motion is described by Darcy's law as applied to a saturated porous medium having variable conductivity. Perturbation techniques were applied in constructing the solution to this nonlinear problem. For certain portions of the flow region the perturbation becomes singular, and the singularities were removed by the methods of matched asymptotic expansions. Properties of singular integrals with Cauchy kernels were employed in certain quantitative estimates. Only the first-order effects are presented here. It was shown that one large-time effect of prolonged rainfall is to generate outward horizontal velocity components in the distant regions of the slope; these components grow in time. It is known in soil mechanics that such tendencies to outward flow have serious destabilizing effects on the soil slope. This paper demonstrates that the underlying causes for such disasters as landslides can be traced in a significant fashion to the hydrodynamic nature of the seepage that evolves naturally as a result of prolonged rainfall. COLUMN SCANNING WITH SIMULTANEOUS USE OF 241AM AND 137CS GAMMA RADIATION,
Agricultural Univ., Wageningen (Netherlands).
L. Stroosnijder, and J. G. De Swart.
Soil Science, Vol 118, No 2, p 61-69, August 1974. 4 fig, 1 tab, 13 ref.

Descriptors: *Soil moisture, *Moisture availability, *Groundwater availability, *Radioisotopes, *Analytical techniques, Soil analysis, Instrumentation, Soil tests, Soil water, Moisture content, Hydrologic properties, Radiation, Gamma rays, Radiochemical analysis, Radioactivity techniques, Analysis.
Identifiers: *Gamma radiation, *Column scanning, 241 Am, 137 Cs, *Automatic scanner, Statistical accuracy, Counting rates, Attenuation coefficients.

A soil column scanner using two sources of gamma radiation (241 Am and 137 Cs) simultaneously was described. Separate amplifer/discriminator systems were used for each source. In order to minimize the 137 Cs influence on the 241 Am detector, a cross-beam layout was chosen. A correction of about 10 counts/second on the 241 Am count rate eliminated any remaining 137 Cs influence. Punch tape output permitted fast data assimilation. Variation in mass attenuation coefficients for soil seriously limited the use of this technique in natural soil columns. Statistical accuracy was poor compared to a single moisture determination. A counting time of at least one minute was preferable. An experiment with a swelling clay soil demonstrated the possibility of simultaneous use of both radioisotopes. The results of calibration studies were shown. (Henley-ISWS)

Available from NTIS, Springfield, Va. 22161 as AD-772 042, Price $3.75 printed copy, $2.25 microfiche. Royal Institute of Technology Nuclear Magnetic Resonance Group Final Technical Report to US Army European Research Office, London, July 1973. 85 p, 32 fig, 7 tab, 71 ref. USA Contract No DAJA 37-72-C-3894.

Descriptors: *Clay minerals, *Adsorption, *Ion exchange, Kaolinite, *Montmorillonite, Nuclear magnetic resonance, Differential thermal analysis.
Identifiers: *Clay-water interactions, Vermiculite, *Hectorite.

A study of clay-water interactions by NMR and dielectric experiments compared montmorillonite and hectorite. In particular, the temperature dependence of the NMR and dielectric absorption bandwidths pointed to different proton relaxation mechanisms in the two types of clay. In fact, the nature of the discrepancies between the expected and observed system behavior called for a reconsideration, not only of the available data regarding the clay surface properties, but also of the conceptual framework currently used to explain the swelling and cation exchange mechanisms. Reconsideration of the surface structure problem is based on reevaluation of Fourier syntheses, on water structuring as revealed by recent Raman, NMR and dielectric investigations and a reevaluation of data pertaining to swelling and b-axis changes of montmorillonites. New aspects on the adsorbed water density are discussed together with questions regarding ion water interactions in kaolinite, montmorillonite, vermiculite and hectorite. (Knapp-USGS)

RECLAMATION AND MAINTENANCE OF FERTILITY OF MAJOR SOILS IN THAILAND,
A. Komes.
Thai J Agric Sci. Vol 6, No 2, p 127-143. 1973.
Identifiers: *Soil fertility, *Land reclamation, *Saline soils, *Thailand, Land use.

Soils of Thailand are of 3 groups according to physiography: soils of the alluvial plains and the lower terraces, soils of the higher terraces and the low plateaus, soils of the hills and the mountains. The reclamation is done mostly for soils of the 1st group: beach and dune sand, saline soils, acid sulfate soils, low-lying floodplains derived from sandstones, and tin-mine spoils. The soils of 2nd group are well drained, but their low organic matter content seems to cause soils to erode easily and to exert other unfavorable properties in relation to plant growth. Soil conservation practices were demonstrated at various land development centers throughout the country. The soils of the 3rd group are easily subject to severe erosion. A general review of land use and problems associated with it is given for each soil described.--Copyright 1974, Biological Abstracts, Inc.

STUDIES ON THE RELATIONSHIP BETWEEN MISCANTHUS SINENSIS COMMUNITY AND SOIL: IV. RELATIONSHIP BETWEEN HUMUS AND PRODUCTIVITY OF MISCANTHUS SINENSIS GRASSLAND,
Kobe Univ. (Japan). Faculty of Agriculture.
R. Kayama, N. Yano, and M. Fujimoto.
Jap J Ecol. Vol 22, No 5, p 195-204. 1972. Illus.
Identifiers: Grassland, *Humus, Magnesium, *Miscanthus-Sinensis, Nitrogen, Potassium, Respiration, Soil moisture.

The relationship among the standing crop of plants, the components of humus, seasonal change of soil moisture, amount of inorganic N and soil respiration are discussed. The amount of the minerals such as K and Mg in the fulvic acid of the humus in plots having a high standing crop was more than that of plots having a lower standing crop. The presence of a considerable amount of Al in fulvic acid was shown in the low yield plots. The seasonal variation of the soil moisture in the high yield plot was small. Generally, the soil moisture of the upper layer (0-30 cm) was constantly kept at a high level. On the contrary, the soil moisture of the upper layer decreased from July to Oct. in the low yield plots. The plot having a deep humus soil layer and favorable soil moisture content had NH4-N and HO3-N a little more than those of the other plots. These were conditioned to contain water in 60% of the maximum water holding capacity and placed in a thermostat of 30C for 3 wk. Thereafter, quantitative analysis was made on the amount of NH4-N and NO3-N. This amount may be considered as potential available N. The amount of NO3-N was scarce but that of NH4-N was usually high. There seemed to be a considerable amount of available N in the soil for the vigorous reproduction of microorganisms. (See also W72-00721)--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF COARSE CONSTITUENTS ON DYNAMICS OF WATER IN A SANDY SOIL: II. DYNAMICS OF WATER IN A FINE-EARTH/COARSE CONSTITUENTS SYSTEM: POSITIVE MOISTURE CHANGES, (IN FRENCH),
Institut National de la Recherche Agronomique, Versailles (France). Station Centrale d'Agronomie.
R. Gras.
Ann Agron (Paris). Vol 23, No 3, p 247-316. 1972. Illus. (English summary).
Identifiers: *Sandy soils, *Soil moisture, *Permeability.

A pebble-containing soil is a heterogeneous system consisting of two materials, fine earth and pebbles (coarse constituents). The dynamics of water in such a system was investigated experimentally using tubes filled with sandy soil containing coarse constituents of definite geometrical shape. The effects of these tubes on the kinetics of the moist front creeping forward in an initially dry soil under different water supply conditions, i.e., horizontal influx, vertical or horizontal moistening are investigated. Experimental data were evaluated in the simpler instances on the basis of the laws of hydrodynamics. After wetting the system, the effect of the coarse constituents on the conveyance of the water by the system is discussed. All constituents curtail the aggregate permeability of the system. During previous experiments the coarse porous constituents may be moistened by the sand. The variational moisture recorded arises from the nature of the coarse constituents and from the water sucked in by the sandy soil and coarse constituents.--Copyright 1973, Biological Abstracts, Inc.

COMPUTER INVESTIGATIONS OF WATER MOVEMENTS IN LAKES.
A. H. Taylor.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 209-227, 25-27 September 1973. 6 fig, 3 equ, 23 ref.

Descriptors: *Water circulation, *Lakes, Computers, *Computer models, *Simulation analysis, *Mixing, *Turbulence, Variability, Temperature, Currents(Water), Velocity, Flow, Equations, Systems analysis.

Turbulent mixing plays a fundamental role in lake ecology. Considered is the use of computers to predict the circulation and mixing in lakes. The circulation, which gives rise to turbulent water movement, may not be clearly defined and may change rapidly with atmospheric conditions. Numerical simulations can elucidate lake currents besides providing forecasts for management purposes. Previous models for calculating fluid flows are discussed. Three-dimensional calculations are becoming possible and provide detailed velocity and temperature fields; presented is one such model having variable turbulence coefficients, suited to the variability of lake circulations. The model is designed to investigate lake water movement on an hourly, or a daily, basis to provide insight into the mechanisms of lake mixing. Equations of the lake model are given, and numerical experiments with homogeneous bodies of water are discussed. (See also W74-12107) (Bell-Cornell)

WIND DRIVEN CIRCULATION IN SHALLOW LAKES: A FINITE ELEMENT APPROACH,
Water Research Association, Marlow (England).
J. M. Davis.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 63-70, 25-27 September 1973. 3 fig, 19 equ, 3 ref.

Descriptors: *Finite element analysis, *Lakes, *Shallow water, *Circulation, *Winds, Velocity, Lake Erie, Lake beds, Currents(Water), Analytical techniques, Systems analysis.
Identifiers: Wind accelerations, Differential equations.

The finite element method is applied to the problem of wind-driven circulation in shallow lakes. The system is considered to be two dimensional so that vertical accelerations and velocities are ignored under the assumption that they are small compared with horizontal velocities. A hydrostatic pressure distribution is assumed to exist. The model describes the unsteady circulation pattern due to wind stresses at the free surface and includes both bed friction and Coriolis effects. The Galerkin method of weighted residuals is used to formulate a set of matrix equations which are solved using an implicit time integration scheme. The components of wind force represent the forcing functions of the system, and the effect of bed friction and the Earth's rotation are included through the Chezy friction term and the Coriolis parameter respectively. The methodology is illustrated with an application to Lake Erie. (See also W74-12107) (Bell-Cornell)

Potamogeton pectinatus and Myriophyllum spicatum form a broad band of plants in front of reeds. Their distributional pattern is dependent on wind and soil conditions. Soft silt deposits in combination with low turbulence are favorable conditions. The diminished growth along the eastern shore and toward the open sea are proof that waves and a solid or coarsely structured substrate have a negative effect on their growth. P. pectinatus is found in variable densities and crop configurations all over the sea surface and is more abundant within the reed belt than M. spicatum, but takes up a lesser areal portion than the latter. The density of P. pectinatus has decreased due to the increase in depth from 102 cm in 1958 to 165 cm in 1970. Ceratophyllum demersum, Chara ceratophylla and Najas marina are other submerged plants found in the area.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Canals, *Carp, Fertilizer, *Fish ponds, Grass carp, Hydrochemical studies, Percolation, Physicochemical studies, Temperature, *USSR(Southern Todzhik SSR).

An investigation of the ponds of the 'Chubek' fishery, located along the former bed of the Afgan-Darya River in southern Tadzhikistan, USSR, showed that the natural and climatic conditions of the location of the ponds are favorable for raising pond fish (carp and grass carp). The temperature regime of the fish ponds is characterized by early warming of the water and comparatively late cooling. The hydrochemical regime of the ponds is favorable. The application of fertilizer to the pond did not have a noticeable adverse effect on the gas regime of the water. Water exchange in the ponds occurs rather intensely owing to percolation of water through the bed and embankments of the ponds. The ponds, which are supplied by a system of canals, accumulate a large quantity of suspended mineral substances, which leads to a reduction of their useful volume and area.--Copyright 1974, Biological Abstracts, Inc.

DISTRIBUTION OF CYCLOPOIDA COPEPODITES IN THE RESTING STAGE IN BOTTOM SEDIMENTS OF ASTATIC RESERVOIRS,
Polish Academy of Sciences, Warsaw. Inst. of Experimental Biology.
M. Wierzbicka.
Pol Arch Hydrobiol. Vol 19, No 4, p 369-376, 1972, Illus.
Identifiers: Acanthocyclops-Bicuspidatus, Acenthocyclops-Gigas, *Astatic reservoirs, *Bottom sediments, Chemical studies, Climatic studies, *Copepodites, *Cyclopida, Cyclops-Furcifer, Cyclops-Strenuus, *Distribution(Vertical-horizontal), *Poland(Warsaw region), Reservoirs, Sediments.

Horizontal and vertical distributions of copepodites IV and V in the resting stages of 4 Cyclopoida species (Cyclops strenuus, C. furcifer, Acanthocyclops gigas and A. bicuspidatus) were investigated in bottom sediments of 2 astatic reservoirs deprived of water from the end of June until March. The reservoirs are situated close to each other among cultivated fields near the Kampinos Forests, about 30 km from Warsaw, Poland. There were significant differences in quantitative species composition between the reservoirs. Moreover, there were significant differences in horizontal distribution of copepodites in the smaller reservoir between July and Aug. There were also differences in vertical distribution: in the smaller reservoir there were more copepodites in the top layer of sediment (0-1 cm) than in the larger one and they only penetrated to 2.5 cm. The following similarities were found: maximal numbers of copepodites were in the 1-2 cm layer in both reservoirs in Aug. and Oct.; at that time specimens did not penetrate deeper than 5 cm; the species common to both reservoirs preferred similar depths. The differences were probably due to: different substrates, the chemistry of the reservoirs, the span of time from the beginning of the resting stage (influencing the vertical distribution) and climatic conditions (influencing the horizontal distribution).--Copyright 1974, Biological Abstracts, Inc.

UTILIZATION OF FACTORIAL ANALYSIS IN CONNECTION WITH THE STUDY OF GROWTH IN BENTHIC MOLLUSKS OF LAKE CHAD, (IN FRENCH),
C. Leveque, and M. Gaborit.
Cah O R S T O M Ser Hydrobiol. Vol 6 No 1 p 47-66, 1972. Illus. English summary.
Identifiers: Bellamya, Benthic studies, *Chad(Lake Chad), Cleopatra, Corbicula, *Factorial analysis, *Growth rate, Lakes, Melania, *Mollusks, Sediments.

After a brief account of basic principles necessary for a right interpretation of the method used, factorial analysis of correspondances was applies to samples taken during 2 missions in the Bol area (1967 and 1970) and 2 missions on the whole lake Chad (1968 and 1970). Individuality of populations for each type of bottom recorded in the Bol area was shown. In the lake as a whole and for the same grographical zone, the nature of the sediments has some influence on the specific composition of populations. Populations of the central part of the lake differ fundamentally from the populations of other biotopes by dominance of Melania and importance of Bellamya in their specific profile. On the other hand Cleopatra are dominant in the eastern part of the lake where Corbicula are also of importance. Presence of intermediate populations between the 2 preceding units, in which the relative importance of Melania and Cleopatra is quite the same, leads to the conclusion that they are 2 vicariantes species, that is one species can be substituted for the other species under particular conditions. This phenomenon could be observed in 1970 for populations living on the mud in the Bol area, as well as for some biotopes from the eastern zone of the lake. Apart from this evolution, stability is usually observed within a 2 yr period for the average samples of one biotope. There is no specific affinity between the 7 species studied.--Copyright 1974, Biological Abstracts, Inc.

FEASIBILITY STUDY TO DEVELOP GUIDELINES FOR LAKE AND RELATED LAND RESOURCE USE DEVELOPMENT RESEARCH, OR ECONOMIC AND ECOLOGICAL IMPACT OF VARIOUS FORMS OF LAKE RESOURCE DEVELOPMENT,
New Hampshire Univ., Durham. Water Resource Research Center.
R. A. Andrews.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 912, $3.25 in paper copy, $2.25 in microfiche. Completion Report, (1974). 32 p, 17 ref, 3 append. OWRT A-036-NH(1). 14-31-0001-4029.

Descriptors: *Land use, *Feasibilities studies, *Lake development, *Water resources development, *New Hampshire, New England, Water quality.
Identifiers: *Lake water quality, *Lake resource development, Ecological impact, Lake Winnepesaukee(NH), Squam lakes.

Many New Hampshire lakes are rapidly being developed, mainly for recreational purposes. The vacation cottage or second home is a major, but not the only, kind of development taking place. Concern over type and kind of development began in the late 1960s and early 1970s. This study investigated research approaches to answer numerous questions relating to guiding lake development. An attempt was made to develop an interdisciplinary project to analyze the impacts of alternative futures for lake and related land resources. Officially, New Hampshire does not have polluted lakes. This is solely based on coliform count. Eutrophia and weed problems, however, are numerous. Sources of major eutrophia problems are discussed. A wide range of current development found on lakes is discussed and oriented to historical development patterns, access and distance from large population centers. This development has given rise to a sizeable service industry and shopping centers. A number of communities have established good relations with the industries and spend sizeable amounts on providing public services. A brief review of the literature revealed some mixed results in terms of physical and economic impact on an area. Marinas and septic tanks may have helped maintain the quality of some lakes.

DIATOMS OF THE CONCRETE EMBANKMENT OF THE ZEGRZE LAKE,
Inst. Bot., Wars. Univ., Warsaw, Pol. Warsaw Univ. (Poland). Inst. of Botany.
H. Borzdynska.
Acts Soc Bot Pol. Vol 42, No 1, p 21-40, 1973. Illus.
Identifiers: Amphora, Cymbella, *Diatoms, Lakes, Navicula, Nitzschia, *Poland(Zegrze Lake).

It was established that conditions for the development of diatoms on a concrete embankment are favorable. Beside organisms permanently or periodically connected with the solid substrate, typical planktons also occurred. The following species were most numerous: Cymbella affinis, Nitzschia kutzingiana, Amphora ovalis var. pediculus and Navicula gracilis. The most intensive development of diatoms was observed in April, May, July and Oct. The total number of organism depended on pollution of water in the Zeran Canal (Poland), increased water temperature in autumn in the section between the Canal and Bialobrzegi and intensity of waves.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF MARISA CORNUARIETIS ON POPULATIONS OF BIOMPHALARIA GLABRATA IN FARM PONDS OF PUERTO RICO,
San Juan Tropical Disease Lab., Puerto Rico.
W. R. Jobin, F. F. Ferguson, and L. A. Berrios-Duran.
Am J Trop Med Hyg. Vol 22, No 2, p 278-284. 1973. Illus.

Descriptors: *Farm ponds, Ponds, Mollusks, Gastropods, Snails, Population, Puerto-Rico, Reservoirs.
Identifiers: Biomphalaria-glabrata, Marisa-cornuarietis, Schistosoma-mansoni.

A biological control method is reported, utilizing an ampullarid snail, M. cornuarietis, to eliminate B. glabrata, the molluscan host of Schistosoma mansoni. The limitations and economics of this method required further clarification. This study was conducted in 9 small reservoirs in Puerto Rico to establish the probability of success of the method under various loading rates and vegetation conditions. Adult M. cornuarietis were transplanted from natural habitats into 7 of 9 study ponds, all of which contained stable populations of the planorbid snails. The snail populations were monitored for almost 2 yr after the initial loading with Marisa. Although the planorbid snail populations remained strong in the untreated ponds, they were controlled in 2 of the treated ponds and significantly reduced in 3 others. In the remaining 2 treated ponds there was no significant decrease in the B. glabrata populations. There was a close correlation between the success of the method and the amount of vegetation in the ponds. In the 2 ponds were the planorbid snails were controlled, there was very little vegetation. In the 2 ponds where the planorbid snails were controlled, there was very little vegetation. In the 2 ponds where the planorbids were not affected, the surfaces of the ponds were completely covered with vegetation. There was no correlation between the success of the biological control method and the rate at which the M. cornuarietis were added to the ponds. The average loading rate for all 7 ponds was 2 M. cornarietis per sq m of pond surface.--Copyright 1973, Biological Abstracts, Inc.

SPECIES AND QUANTITATIVE CONTENT OF THE PLANKTON AND BENTHOS OF THE AGGEL' LAKE, (IN RUSSIAN),
R. A. Safarov.
Izv Akad Nauk Az SSR Ser Biol Nauk. 4, p 55-57. 1972.
Identifiers: *Benthos, *Plankton, *USSR(Aggel Lake), Zooplankton.

In a study of the zooplankton organisms of the Aggel' lake (USSR) 11 spp. and forms were noted. Among zoobenthic organisms 48 spp. and forms were recorded. Two factors determine the character of the species and quantitative content of benthos. These are a low water temperature and transparency of the lake water. Benthos comprise 30.5% of the total fauna, with average biomass at 5.24-6.51 g/sq m with variations from 3.36 to 10.10 g/sq m. Leeches, mollusks, Odonata, caddix-flies and midge larvae were predominant.-Copyright 1974, Biological Abstracts, Inc.

FOOD AND FEEDING HABITS OF SOME EGYPTIAN FISHES IN LAKE QUARUN: I. TILAPIA ZILLII (GERV.) B. ACCORDING TO DIFFERENT LENGTH GROUPS,
S. A. Abdel-Malek.
Bull Inst Oceanogr Fish. 2, p 204-213. 1972. Illus.
Identifiers: *Chrysophrys, *Egypt(Lake Quarun), Mugil, Solea, Tilapia, *Fish food organisms.

The material (Tilipia zillii, Solea vulgaris, Mugil saliens, M. cephalus, M. capito, Chrysophrys aurata) was collected over a 3 mo. period from May-July 1969. The results so obtained were analyzed by using the occurrence and the points methods. According to the present data, 3 major groups were formed: A-group:30-45 mm; B-group:46-90 mm and C-group:91-250 mm. In the 3 different length groups of Bolti, the plant material were the chief food items. The importance of the animal food increases to a certain extent as the fish grows larger. It is of interest to mention, that the small (30-45 mm long) feed on a limited number of small slow-moving organisms and as they grow larger their diet becomes more varied. The change in

composition of the diet as the fish grows is an expression of increase in the minimum size of the organism eaten. Small fish are unable to swallow the relatively large organisms such as mollusks (gastropods and Abra ovata) and polychaetes (Nereis spp.). As the fish grows larger the percentage of empty alimentary canals increases. This presumbly indicates that the fish eat more sporadically as they grow.--Copyright 1973, Biological Abstracts, Inc.

ALLUVIAL GRASSLAND ECOSYSTEMS: HABITAT CHARACTERISTICS,
Ceskoslovenska Akademie Ved, Brno. Botanicka Ustav.
B. Ulehlova.
Prirodoved Pr Ustavu Cesk Akad Ved Brne. Vol 7, No 4, p 1-41. Illus, 1973.
Identifiers: *Alluvial grasslands, Alopecurus-pratensis, *Climate, Ecosystems, Festuca-sulcata, *Grassland habitat, Minerals, Nitrogen, Organic matter, Soil moisture.

The habitat characteristics were studied in 3 alluvial grassland communities, i.e., Serratulo-Festucetum commutatae, Gratiola officinalis-Carex praecoxsuzae and Glycerietum maximae arranged from the driest to the wettest one. The climatic data for the area and years of the investigations are given. The fluctuations of the groundwater table and of soil moisture content reach the highest and lowest values in the habitat of Glycerietum maximae and Serratulo-Festucetum commutatae, respectively. pF (water holding index) curves of the soils and the composition of the rain, flood and groundwater of all habitats are presented. Lysimetric measurements were taken, and the composition of soil percolates in different soil layers was assessed. The contents of soil organic matter and soil N and their fluctuations increase from the least productive dry to the most productive wet grassland ecosystem. The contents of organic matter and N were estimated in different fractions of the humus, i. e., in the free, sorbed, and chemically bound humic substances in the soils. The character of humus is different in the soils of each plant community. Finally, the mineral composition of the shoots, roots and litter was assessed for Festuca sulcata and Alopecurus pratensis during their ontogenesis. These 2 spp. are the respective dominants of Serratulo-Festucetum commutatae and Gratiola officinalis - Carex praecox-suzae.--Copyright 1974, Biological Abstracts, Inc.

PHYTOPLANKTON COLLECTED BY THE 'OMBANGO' OFF ANGOLA (10-27 NOVEMBER 1965), (IN FRENCH),
Museum National d'Histoire Naturelle, Paris (France). Laboratoire des Peches Outre-Mer.
J. Reyssac.
Bull Inst Fondam Afr Noire Ser A Sci Nat. Vol 34, No 4, p 796-808, 1972, Illus. English summary.
Identifiers: Ceratium-furca-var-furca, Chaetoceros-lorenzianum, Coasts, Dinophysis, Diversity, Index, Nutrients, Peridinium, *Phytoplankton, Rhizosolenia-acata-f-gracillima, Salinity, Soils, Stephanopyxis-palmeriana, Temperature, *Diatoms, *Dinoflagellates, *Africa(Angola).

Diatoms and dinoflagellates collected during the cruise of 'Ombango' along the Angola coast are inventoried. The 37 catches were made in an area comprised between 4 deg 52 min and 13 deg 55 min S i. e., from Pointe-Noire to a point south of Benguela. Catches come from the coastal waters but chiefly from the open sea extending to 9 deg 15 min E. Surface temperatures were near 24-25C. The salinity and varied considerably; a low salinity was noted southwest of Pointe-Noire; an area particularly reached by Congo waters. The thermocline is present in the whole area except near the coast (50 and 100 m depths) where it is divided in steps as a result of vertical movements. In all the catches, 55 spp. of Diatoms and 80 spp. of Dinoflagellates were identified. The flora is typically tropical. Populations generally are sparse and consist chiefly of Dinoflagellates (Ceratium, Peridinium, Dinophysis). However, a few blooms of diatoms appear south-west of Pointe-Noire beyond 1000 m depth and near Loanda in the coastal waters as well as in the offing. In front of Pointe-Noire, the fertility of waters is due to the arrival of freshwaters containing a great quantity of soil components. In front of Loanda, the fertility is caused by vertical movements particularly strong near the coast. The study of diversity index shows that these 2 areas have an intense activity, sharply contrasting with the other zones studied where populations have greater maturity. The main blooms were noted with the following species: Stephanopyxis palmeriana, Rhizosolenia alata f. gracillima, Chaetoceros lorenzianum. As the regards the genus Ceratium, especially diversified in the Angola waters, attention should be drawn to the different affinities of the 2 varieties of Ceratium furca: the variety furca is to be found mainly in the warm waters, the variety eugrammum in colder waters.--Copyright 1974, Biological Abstracts, Inc.

THE KUROSHIO II. PROCEEDINGS OF THE SECOND SYMPOSIUM ON THE RESULTS OF THE COOPERATIVE STUDY OF THE KUROSHIO AND ADJACENT REGIONS, TOKYO, SEPT 28-OCT 7, 1970.
Saikon Publishing, Co., Tokyo, 1972, 562 p, Illus, Maps.
Identifiers: Chlorophyll, Cooperative studies, *Fisheries, *Japan(Kuroshio region), *Oceanography, *Pacific Ocean, Plankton, Symposia, Thermocline, Zooplankton, Publications, Primary production.

An extensive number of papers, including introductory contributions on general aspects involving the Kuroshio and adjacent regions, are presented. The majority of the contributions are presented in 3 sections under the following categories: physics, chemistry and geology; biology and biochemistry; the fisheries oceanography. The first section includes papers on such topics as: occurrence of the thermocline in the shelf area south of Hong Kong; distribution of vanadium in the Kuroshio and adjacent regions; distribution of the bottom deposits on the Hong Kong fishing grounds; and study of the bottom sediments in the sea area of the west coast of Korea. The next section, covers such topics as: primary production in the western tropical and subtropical Pacific Ocean; composition of organic matter in subsurface chlorophyll maxima; herbivorous zooplankton-food zooplankton relationships in the Western North Pacific; and occurrence of ostracods in the neighboring seas of Taiwan. The final section covers such topics as: range of the skipjack tuna subpopulation in the western Pacific Ocean; studies on spotted mackerel resources of Taiwan; identification of Nemipterus in Thailand; and the occurrence and distribution of the fish eggs and larvae in the Korean adjacent Sea. Numerous maps, tables and other illustrations are included, and each paper lists literature cited.--Copyright 1974, Biological Abstracts, Inc.

AN OPTICAL PLANIMETER FOR LEAF AREA DETERMINATION,
Georgia Uiv., Athens. Inst. of Ecology., and Forest Service (USDA), Southeastern Forest Experiment Station. Franklin, N.C.
C. S. Gist, and W. T. Swank.
The American Midland Naturalist, Vol 92, No 1, p 213-217, July, 1974. 3 fig, 6 ref.

Descriptors: *Leaves, *Deciduous trees, Plant morphology.
Identifiers: Leaf area index.

An optical planimeter for determining leaf area is presented. The system proposed is simple and easily used, compact and somewhat portable, accurate and species-independent with respect to estimates of leaf area. Calibration and tests have shown the system exhibits a linear response to changes in leaf area. The system was not designed to stand the rigors of field use and may prove to be a disadvantage to certain users.

T. V. Gerasimenko.
Bot Zh. Vol 58, No 4, p 493-504. 1973. Illus, English summary.
Identifiers: Alopecurus-alpinus, Artemisia-furcata, Astragalus-umbellatus, Caltha-arctica, Carex-lugens, Claytonia-arctica, Dryas-punctata, Islands, Lagotis-minor, Nardosmia-frigida, *Photosynthesis, Plants, Rhodiola-borealis, Rumex-arcticus, Russian-SFSR, Salix-glauca, Salix-phlebophylla, Saussurea-tilesii, *Temperature, *Tundra, *USSR(Wrangel Island).

Temperature effect of the photosynthesis of arctic plants is of great interest. The dependece of photosynthesis on temperature during different terms of vegetative period had been studied by the radiometrical method in 14 spp. of higher plants (Claytonia arctica, Rhodiola borealis, Astragalus umbellatus, Lagotis minor, Artemisia furcata, Nardosmia frigeda, Saussurea tilesii, Dryas punctata, Salix glauca, S. phlebophylla, Carex lugens, Alopercurus alpinus, Caltha arctica, Rumex arcticus) from the Wrangel island (Russian S FSR USSR). Photosynthesis can take place in a wide range of temperatures, from minus 3 deg to plus 45 deg; the optimal temperature zone being about plus 20 deg, which is much higher than the prevailing temperature in natural habitat conditions. It is shown that the temperature optimum of photosynthesis remains the same all through the period of vegetation. The data presented show the wide range of adaptation of the plants' assimilation apparatus to different temperatures.--Copyright 1974, Biological Abstracts, Inc.

LEAF ANATOMICAL AND PHOTOSYNTHETICAL REACTIONS OF QUERCUS PUBESCENS WILLD. TO ENVIRONMENTAL FACTORS IN VARIOUS ECOSYSTEMS: I. LEAF ANATOMICAL REACTIONS,
National Museum of Natural History, Budapest (Hungary). Dept. of Botany.
G. Fekete, and J. Szujko-Lacza.
Acta Bot Acad Sci Hung. Vol 18, No 1/2, p 59-89, 1973. Illus.
Identifiers: *Leaves, Mesophyll, *Photosynthesis, Quercus-pubescens, *Oak trees.

The ecological inquiry of this work concerns the changes in 4 anatomical characteristics in the leaves of Quercus pubescens, under the influence of environmental factors. From 2 levels of light and water supply and the combinations of these, 4 habitat types were selected. The rate of palisade per spongy parenchyma and the size of the mesophyll chambers react in the same way to the combinations of the 2 factors. The effect of light along on the rate of palisade per spongy parenchyma is significant; while on the size of mesophyll chamber each of the 2 factors has a significant influence; on the intercellular rate and stoma frequency only the effect of the water factor is significant in itself. At a lower level of light intensity the leaf anatomical characteristics are more stable against the effects of the water supply of the soil than under more intensive light conditions. The intercellular rate is correlated with the size of mesophyll chambers and with stoma frequency. The mesophyll chamber can be conceived of not only as a unit of gas supply, but as the unit producing the transporting organic matter.--Copyright 1973, Biological Abstracts, Inc.

WATER STATUS OF HERBACEOUS DOMINANTS ON BOTTOM DEPOSITS FREED FROM LAKE SEVAN, (IN RUSSIAN),
N. A. Papikyan, and A. M. Barsegyan.
Tr Bot Inst Akad Nauk Arm SSR. 18, p 128-138. 1972.
Identifiers: Armenian-SSR, *Reeds, *Transpiration, Plant succession, *USSR(Lake Sevan), Lakes.

Investigations of the main indexes of the water status (transpiration rate, water deficit, water-retaining capacity) of the most widespread and characteristic plants of the Sevan bottom deposits (Armenian SSR, USSR) revealed that the establishment of formations and their successions depend on the ability of plants to regulate transpiration. Species not able to regulate transpiration under unfavorable environmental conditions disappear from the structure of the phytocenoses and, conversely, species manifesting a higher degree of plasticity to self-regulation of the water status become dominant. The common reed is the standard of self-regulation of transpiration on Sevan bottom deposits.--Copyright 1973, Biological Abstracts, Inc.

TYPOLOGICAL EVALUATION OF VEGETATION IN THE LOWER CIRCLE OF WESTERN PAMIR BASED ON EXPERIMENTAL STUDY ON THE CHANGEABILITY OF ASSOCIATIONS, (IN RUSSIAN),
Kh. Yu. Yusufbekov, and O. E. Agakhanyants.
Dokl Akad Nauk Tadzh SSR. Vol 15, No 11, p 52-55. 1972.
Identifiers: *Artemisia, *Plant associations, Stipabadachschanica, *Vegetation, *USSR(Western Pamir).

Two localities of Artemisia vachanica associations in this region, 2320 m above sea level, the one toward WSW, slope 8, the second to NW, slope 15, were studied and described repeatedly in 2 dry years (1959, 1971) and in a moist year (1972). This type of plant association is widely distributed in the lower vegetation circle of West Pamir (USSR) and is characterized by a quite rich composition of species. Observations showed that during the moist year, these associations, which before were evaluated as indisputable desert associations, acquired distinct features of steppe associations. This finding was one of the 3 main facts on which the new proposed typological reevaluation of associations in this region was based. The 2nd fact was the observation that A. vachanica during dry years was noticeably oppressed in these associations and that its generative shoots almost did not develop. During a rainy year the A. vachanica association in the locality toward WSW was transformed into a multigrass and mat-grass steepe (the edificator grass was Stipabadachschanica Roshev), increasing the grass yield 3-fold (from 3.8 to 10.2 centn/ha). Thus, increased moisture did call to life steppe associations that were considered to be desert associations.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Chordates, *Denmark, Ecology, *Eelgrass, Fauna, Fishes, Isefjord, Mediomastus-fragilis, Pollution, Reproduction, Systematics, Vegetation, Zostera, Zostera-Marina, Vellerup Vig, Zealand, Roskildefjords, Invertebrates, North Atlantic.

This paper represents the results of more than 30 yr field observations and research work carried out from the Isefjord Laboratory, Vellerup Vig (Zealand, Demark). The Isefjord complex 36 km long, including the main fjord and the Roskilde Fjord, and covering about 400 sq km, is a shallow (7-10 m, maximum 30 m) area dominated by substrata of fine sand to mud with a high content of organic matter. The 1st part gives information about distribution, systematics, ecology and breeding of the majority of the 477 animal species described. Nearly 400 spp. are invertebrates and of the chordates 68 species are true fishes. Of all animal species, 63% have not previously been recorded from the area, 27 spp. are new to Danish seas and one (Mediomastus fragilis) (Polychaeta, Capitellidae) is new. The hydrography is treated mainly on the basis of literature. The fjord system may be classified as mixohaline: the Isefjord proper is polyhaline (18 + -30 plus or minus %), and the Roskilde Fjord is mesohaline (5 plus or minus 18 plus or minus %). From April to Aug. the Isefjord interior can be classified as a hypersaline estuary due to reduced precipitation and evaporation in connection with high water temperature. The water exchange between the fjord and the Kattegat is insignificant apart from that caused by wind pressure in winter and autumn. The tidal range (about 20 cm) is only of local importance. The water temperature essentially follows that of the air (shallow area) and normally fluctuates from negative temperatures with ice layer in the winter to summer temperatures often far above 20 degrees C. The recent climatic changes in the North Atlantic are discussed and it is shown that the surface water temperature increased considerably from 1930-50 not only in the Isefjord complex but in practically all interior Danish waters, while salinity changes have been of minor importance. The annual gross production of phytoplankton in the Isefjord is exceptionally high in comparison with that of other larger Danish seas and the primary production reaches values of a eutrophic freshwater lake. The eelgrass (Zostera marina) vegetation is treated in a special chapter and the extensive literature concerning the so-called disease and destruction of the eelgrass (1933-34) in northern Atlantic waters is discussed. Temperature and eelgrass conditions in the Isefjord suggest that recent climatic change (increased temperature) is the primary reason for the decline not disease or parasitic attack. The effect of the disappearance of the Zostera on environmental factors and fauna is demonstrated and the importance of the eelgrass as shore protection is shown. The final chapters give a broad ecological outline of the area and treat species composition and distribution, specific morphological variation, reproduction and larval development (for invertebrates) and the influence of environmental factors, especially temperature and salinity, on the fauna. Finally, pollution problems are discussed.--Copyright 1974, Biological Abstracts, Inc.

VEGETATION CHANGES IN SHALLOW MARSH WETLANDS UNDER IMPROVING MOISTURE REGIME,
Canadian Wildlife Service, Saskatoon (Saskatchewan).
J. B. Millar.
Can J Bot. Vol 51, No 8, p 1443-1457. 1973. Illus.

Descriptors: *Marshes, Grasslands, *Vegetation, Cover crops, *Wetlands, Plant growth, Marsh plants, Shallow marshes, Waterfowl, Aquatic life, Habitats, Wildlife habitats, *Moisture.
Identifiers: Alopecurus-aequalis, Beckmannia-syzigachne, Eleocharis-palustris, Glyceria-grandis, Glyceria-pulchella, Polygonum-coccineum, Scolochloa-festucacea, *Canada(Saskatchewan).

Changes in species composition and plant cover were studied in relation to moisture regime over a 10-yr period in 71 shallow marsh-wetlands in the grassland and parkland regions of Saskatchewan (Canada). Decreases in density of the shallow marsh emergents Polygonum coccineum, Carex atherodes, Scolochloa festucacea and Eleocharis palustris occurred with greater-than-normal water depth at the start of the growing season, but 2 or more years of continuous flooding were required to eliminate emergent cover completely and convert the wetland to open water. Repeated autumn reflooding also resulted in complete elimination of emergent species. Changes in species composition occurred when basins were grazed and as vegetation reestablished after cultivation, but no changes followed mowing or burning. Alopecurus aequalis, Beckmannia syzigachne, Glyceria grandis and G. pulchella are designated as 'disturbance' species on the basis of their response to soil-exposing events. Presence of small amounts of deep marsh emergents in shallow marsh wetlands is not considered a reliable indicator of wetter moisture regime. Species composition of rooted submergents in a wetland can be used as an indicator of its moisture regime. Shallow marsh wetlands in basins of 1 ac (0.41 ha) or less experienced little year-long flooding and converted to open water only atypical conditions. Larger wetlands required basin depths in excess of 36 in. 996.4 cm) to have any amount of year-long flooding and to convert to open water. These basin size and depth criteria have applications in habitat evaluation by waterfowl managers.--Copyright 1974, Biological Abstracts, Inc.

FACTORS LIMITING THE DISTRIBUTION OF SALIX NIGRA,
Michigan State Univ., East Lansing. Dept. of Botany and Plant Pathology.
K. W. McLeod, and J. K. McPherson.
Bull Torrey Bot Club. Vol 100, No 2, p 102-110. 1973. Illus.

Descriptors: *Willow trees, Trees, Plant growth, Life cycles, *Oklahoma.
Identifiers: *Black willow, *Salix-Nigra.

Soil moisture, nutrient content, structure and aeration do not appear to limit the distribution of adult black willows in Oklahoma (USA). Instead, the species appears to be limited by the requirements for seed germination and seedling establishment which are met on moist or wet soil. These conditions usually exist only around a permanent source of water where the soil remains wet for an extended period. As determined by pot tests, established plants do not have a high moisture requirement and hence the species could survive in a broader range of environmental conditions than it is restricted to by its seedlings.--Copyright 1974, Biological Abstracts, Inc.

SEED WEIGHT IN RELATION TO ENVIRONMENTAL CONDITIONS IN CALIFORNIA,
California Univ., Berkeley. Dept. of Botany.
H. G. Baker.
Ecology. Vol 53, No 6, p 997-1010. 1972, Illus.

Descriptors: *Environmental effects, *Seeds, Weight, *Ecology, California, Shrubs, Trees.
Identifiers: Herbs, Ranunculus, Taxa.

Analyses of the California flora involving nearly 2500 taxa are presented which show that there are correlations between the weights of individual seeds and environmental conditions in which their producers normally grow. These differences in seed weight appear to be adaptive and result from compromises between increased nutrition of the seedling which would result from larger food reserves in heavier seeds and increased dispersibility and increased reproductive output which are provided when smaller seeds are produced in larger numbers. Literature and experiments show a general positive correlation between seed weights and rates of shoot and root growth, at least within species. Herbs (annual and perennial), shrubs and trees are necessarily treated separately in the calculations (for seed weights increase progressively in a series from annual herb to tree when the California flora or any particular community type within it are considered). Raw seed weights are reduced to a series of classes (on a logarithmic basis) before means for floras or community types are calculated. Generalizations arrived at from considerations of 'native' species in 'natural' plant communities are confirmed by their applicability to 'introduced' species now forming various kinds of 'weed' communities in California. Finally, species lists from actual stand analyses, including both 'native' and 'introduced' species, are utilized to provide the data for more precise analyses.--Copyright 1973, Biological Abstracts, Inc.

INTENSIVE CULTURAL PRACTICES INCREASE GROWTH OF JUVENILE SLASH PINE IN FLORIDA SANDHILLS,
Forest Service (USDA), Stoneville, Miss. Southeastern Forest Experiment Station.
J. B. Baker.
For Sci., Vol 19, No 3, p 197-202. Illus. 1973.
Identifiers: Control, Cultural, Fertilizers, *Florida, *Growth rates, *Irrigation, Juveniles, Moisture, Nitrogen, Nutrients, Phosphorus, *Pine(Slash), Pinus-elliotti, Sandhills, Soil, Weed.

Growth of slash pine (Pinus elliottii) planted on a well-prepared Florida, USA, sandhill site and treated with NP fertilizer, irrigation and weed control (applied singly and in factorial combination) was improved in almost direct proportion to the number of treatments applied. Five years after planting, untreated trees averaged 1.7 m tall, 1.52 cm dbh (diameter, breast height) and 821 cu cm in stemwood volume. In contrast, trees subjected to any single treatment, 2 combined treatments, or 3 combined treatments were about 45, 70 and 110% taller; 100, 150 and 230% larger in dbh; and contained 90, 170 and 330% more stemwood volume. Both available soil moisture and nutrients limited tree growth on these sites during various times of the year. Soil moisture deficiencies during the previous fall and current spring restricted elongation of the 1st flush of growth, while nutrient deficiencies limited elongation of subsequent or late flushes as well as diameter growth. Factorial combinations of treatments generally resulted in lower concentrations of N and K in current annual foliage, while fertilization caused slightly higher concentrations of foliar P. Both weed control and irrigation increased available soil moisture and thus decreased the number of days during the growing season that trees were growing under moisture stress.--Copyright 1974, Biological Abstracts, Inc.

ROOT ADAPTATIONS AND RELATIVE FLOOD TOLERANCE OF FIVE HARDWOOD SPECIES,
Clemson Univ., S.C. Dept. of Forestry.
D. Hook, and C. L. Brown.
For Sci., Vol 19, No 3, p 225-229. Illus. 1973.
Identifiers: Adaptations, *Flood tolerance(Trees), Fraxinus-pennsylvanica, *Hardwood, Liquidambar-styraciflua, Liriodendron-tulipifera, Nyssa-aquatica, Platanus-occidentalis, *Root system, Plant species.

Flooding experiments, in a growth chamber and a greenhouse, showed that height growth and root adaptations of yellow poplar, sycamore, green ash, sweet gum, and water tupelo (Liriodendron tulipifera L., Platanus occidentalis L., Fraxinus pennsylvanica Marsh., Liquidambar styraciflua L., Nyssa aquatica L., respectively) were correlated with flood tolerance. All except yellow poplar could be spatially separated along a relative flood tolerance scale by the presence or absence of 1 or more root adaptations. Water tupelo and green ash could be separated only by degree of development of root adaptations.--Copyright 1974, Biological Abstracts, Inc.

CONTRIBUTIONS TO WATER REQUIREMENTS OF WHEAT UNDER DESERT CONDITIONS,
Cairo Univ., Giza (Egypt). Dept. of Botany.
A. A. Abd-El-Rahman, and F. A. Marei.
Flora (Jena). Vol 161, No 5/6, p 539-554, 1972. Illus.

Descriptors: *Wheat, *Deserts, *Plant growth, Osmotic pressure, Wilting point, Drought tolerance, Transpiration, Penetration.

Wheat was grown at different levels of water supply 200-600 mm. A water supply equivalent to 200 mm was found to be the least level required for grain production. At this level the plant tissues suffered a water deficit of about 34%. Under dry conditions the maximum vertical depth reached by the root was 25.9 cm, whereas under wet conditions the maximum vertical depth attained by roots was 68.2 cm. Under unfavorable dry conditions the root demonstrated a consistent slow growth throughout the growth period. Under the favorable conditions, the root exhibited rapid growth in length in the 1st mo. after sowing, followed by very slow growth. It ceases to grow after 2 mo. The desiccation of leaves started in plants exposed to 4 wk of drought with 1 dry basal leaf. The permanent wilting percentage of the soil was reached when the dry period reached 7 wk. The plants, however, survived. The terminal bud was protected by the rolling top leaves and remained uninjured. The transpiration rate exhibited a pronounced decrease when the drought period exceeded 5 wk. Plants subjected to a 7 wk dry period suffered a saturation deficit of about 50%. The osmotic pressure exhibited a great rise with the extension of the drought period reaching 38.1 atm after 6 wk of drought compared with 16.3 atm after 3 wk from irrigation. Plants subjected to a drought period of 7 wk and more failed to produce grains; the ears were empty.--Copyright 1973, Biological Abstracts, Inc.
W74-12721

HYDROCHEMICAL LIVING CONDITIONS OF IMMATURE STAGES OF BOOPHTHORA ERYTHROCEPHALA DE GEER (DIPTERA, SIMULIIDAE): 1. FIELD STUDIES, (IN GERMAN),
Tuebingen Univ. (West Germany). Tropenmedizinisches Institut.
J. Grunewald.
Z Tropenmed Parasitol. Vol 23, No 4, p 432-445, 1972. Illus. (English summary).
Identifiers: *Boophthora, *Diptera, *Germany, Simuliidae, *Blackflies.

Over a period of 6 yr (1960, 1961, 1967-1970) water samples were collected at 149 sites from the great river systems of South-West Germany during all season and at various times of day. For analysis the following 19 factors were determined: water temperature, current velocity, pH value, conductivity, free CO2, O2 content, water hardness, Ca, Mg, alkalinity, consumption of potassium permanganate, chloride, sulfate, ammonia, nitrite, nitrate, phosphate, total Fe, and silicate. At 4 breeding sites of B. erythrocephala a characteristic combination of factors was found which was quite distinct from those of other species of blackflies. Rearing experiments carried out under laboratory conditions (Part 2) were based on this specific combination.--Copyright 1973, Biological Abstracts, Inc.

ECOLOGICAL STUDIES ON MENTHA PIPERITA L.: II. EFFECT OF DIFFERENT LIGHT INTENSITIES ON WATER RELATIONS,
Naples Univ. (Italy). Instituto di Botanica.
Virzo De Santo.
Oecol Plant. Vol 8, No 1, p 25-40, 1973. Illus.
Identifiers: Light, *Mentha-piperita, *Soil moisture, Plant growth, Growth rates.

Investigations were made on the water relations of M. piperita L. plants grown in full daylight (plot D) and at different percentages of natural sunlight, under artificial shades (plot C: 78%, plot B: 44% and plot A: 14% relative light intensity). This species exerts a marked control over water loss. In the more severe environmental conditions (higher evaporative demand and lower soil water supply) of the plot D, in full sunlight, the plants develop larger water deficits than the plants in the shaded plots. M. piperita plants at 44% relative light intensity (plot B) show higher relative transpiration rate than sun plants (plot D). This fact indicates that stomata in leaves of plot B show a smaller degree of closure and this favors any gas exchange. The present data offer a further explanation for equal growth rates of plants at 100% and 44% daylight despite the differing light intensities. At 14% daylight, M. piperita develops the extreme shade form with peculiar features.--Copyright 1974, Biological Abstracts, Inc.

LEISHMANIASIS IN BRAZIL: VI. OBSERVATIONS OF THE SEASONAL VARIATIONS OF LUTZOMYIA FLAVISCUTELLATA IN DIFFERENT TYPES OF FOREST AND ITS RELATIONSHIP TO ENZOOTIC RODENT LEISHMANIASIS (LEISHMANIA MEXICANA AMAZONENSIS),
Instituto Evandro Chagas, Belem (Brazil). Wellcome Parasitology Unit.
J. J. Shaw, and R. Lainson.
Trans R Soc Trop Med Hyg. Vol 66, No 5, p 709-717. 1972. Illus.
Identifiers: *Brazil, *Leishmania, *Leishmaniasis, Lutzomyia, Rodents, *Vectors(Biology), Human parasites.

The seasonal fluctuation of Lu. Flaviscutellata is closely related to rainfall. The population of this species declines during the rainy season (May-March) and increases again during the dry season, reaching a peak toward Dec. and Jan. The numbers of Lu. flaviscutellata caught in various types of forest were compared. This species is more common in the wetter forests of the 'igapo' than in the drier 'terra firme' forests, although similar

seasonal fluctuations are noted in both types of forest. The close correlation between the numbers of Lu. flaviscutellata and the incidence of initial infections of Le. mexicana amazonensis in Oryzomys capito indicates that the major factor controlling the incidence of leishmaniasis is the number of sandflies. (See also W74-12735)--Copyright 1973, Biological Abstracts Inc.
W74-12734

LEISHMANIASIS IN BRAZIL: VII. FURTHER OBSERVATIONS ON THE FEEDING HABITATS OF LUTZOMYIA FLAVISCUTELLATA (MANGABEIRA) WITH PARTICULAR REFERENCE TO ITS BITING HABITS AT DIFFERENT HEIGHTS,
Instituto Evandro Chagas, Belem (Brazil). Wellcome Parasitology Unit.
J. J. Shaw, R. Lainson, and R. D. Ward.
Trans R Soc Trop Med Hyg. Vol 66, No 5, p 718-723. 1972.
Identifiers: *Brazil, *Leishmaniasis, Lutzomyia-Flaviscutellata, Mangabeira, Oryzomys, Proechimys, *Vectors(Biology), Human parasite.

Lu. flaviscutellata is limited in its vertical distribution to a narrow zone just above the forest floor. The very high incidence of Leishmania mexicana amazonensis in ground-loving rodents of the genera Oryzomys and Proechimys, and the location of lesions in man caused by this parasite on the lower parts of the body, both appear to reflect the limited vertical distribution of the sandfly vector. The general lack of human infections of Le. m. amazonensis appears to be associated with the general reluctance of the vector, Lu. flaviscutellata, to bite man. When man enters an area where there are large numbers of Lu. flaviscutellata, such as in the wetter forests, the fly/man contact is raised to such a level that transmission of Le. m amazonensis to man is possible. Such conditions, as judged by the low incidence of Le. m. amazonensis in man, are rare and do not exist in the drier forests where man commonly contracts cutaneous and mucocutaneous leishmaniasis caused by Leishmania of the Le. braziliensis complex. W74-12735

ECO-PHYSIOLOGICAL STUDIES ON DESERT PLANTS: VIII. ROOT PENETRATION OF LEPTADENIA PYROTECHNICA (FORSK.) DECNE. IN RELATION TO ITS WATER BALANCE,
Cairo Univ., Giza (Egypt). Dept. of Botany.
K. H. Batanouny, and A. M. Abdel Wahab.
Oecologia (Berl). Vol 11, No 2, p 151-161. 1973. Illus.
Identifiers: *Leptadenia, *Soil moisture, Roots.

L. pyrotechnica is a leafless tree growing under adverse arid conditions in the valleys of the Eastern Desert in Egypt. The plant cover in areas inhabited by the species in very low and amounts to only 1% in some localities. In such an open vegetation competition between roots is lacking and each root system monopolizes a huge volume of soil. The root system of a small Leptadenia bush penetrates to a depth of 11.5 m and has a lateral extension of 10 m. The root system exploits about 850 cu m of soil. The distribution of the roots and their branching is closely related to the availability of the soil moisture in the different strata. The available soil moisture is not uniform throughout the whole profile. Depending on the average available soil moisture at the different depths, the total available moisture on the soil volume occupies by the root system of Leptadenia bush is found to be about 23,000 kg. The annual water output by the studied bush is found to be 5700 kg. This means that the available water in the soil occupied by the root system is sufficient to supply the plant for a period of 4 yr without replenishment by rainfall. The present study shows that the plant can live safely for several years under the severe conditions of the desert. The plant possesses some characteristics which help it to keep its water balance positive through increased absorption.--Copyright 1973, Biological Abstracts, Inc.

CHARACTERISTICS OF THE WATER REGIME OF PEAS AT DIFFERENT SOIL MOISTURE LEVELS AND WITH THE USE OF MOLYBDENUM, (IN RUSSIAN),
V. P. Zaslonkin.
Biol Nauki. Vol 16, No 2, p 82-86. 1973.
Identifiers: *Molybdenum, *Peas, Transpiration, *Soil moisture.

Under the effect of drought the total water content in pea leaves, rate of transpiration and water uptake by the root system decrease, whereas the content of bound water increases. Mo increases the content of total and bound water in pea levels. The transpiration rate under the effect of Mo under optimal water supply conditions of the plants increases in the morning and decreases during the afternoon and evening; under drought conditions it decreases all day. The uptake of water by the root system increases in the presence of an optimal water supply of the plants and decreases under drought conditions.--Copyright 1973, Biological Abstracts, Inc.

SEDIMENT TRANSPORT BY STREAMS IN THE DESCHUTES AND NISQUALLY RIVER BASINS, WASHINGTON, NOVEMBER 1971-JUNE 1973,
Geological Survey, Tacoma, Wash.
L. M. Nelson.
Open-file report, 1974. 33 p, 19 fig, 2 tab, 13 ref.

Descriptors: *Sediment yield, *Sediment transport, *Washington, Sedimentation, Reservoir silting, Sediment load, Erosion, Topography.
Identifiers: *Deschutes River basin(Wash), Nisqually River basin(Wash).

Fluvial-sediment transport was studied in the Deschutes and Nisqually River basins, Washington. These two adjacent basins in southwestern Washington cover about 874 square miles and range in altitude from sea level to about 14,400 feet on Mount Rainier. The topographic relief is modified by glaciation, and landforms include steep mountain slopes, rolling foothills, and lowland glacial-drift plains separated by river flood plains. Abundant precipitation, ranging from slightly less than 40 inches to more than 140 inches sustains a thick vegetative cover over most of the area. The measured suspended-sediment concentrations in streams in the two basins ranged from less than 1 to 8,650 milligrams per liter and reflected a rapid increase in concentration with increasing streamflow. The probable annual suspended-sediment yields ranged from 20 tons per square mile to 2,500 tons per square mile. Probable annual sediment discharge of the Deschutes River at Olympia is 25,000 tons, while that of the Nisqually River near Nisqually is 105,000 tons. Annually, most of the sediment is transported in a few days during periods of high streamflow. Little sediment is eroded from the lowlands; most of the sediment originates in the mountains. Except for deposition of sediment in Alder Reservoir and Capitol Lake, only slight changes in the sediment-transport pattern probably occur as a result of human activity. (Knapp-USGS)

THE HYDROMETER METHOD FOR DETAILED PARTICLE-SIZE ANALYSIS: 1. GRAPHICAL INTERPRETATION OF HYDROMETER READINGS AND TEST OF METHOD,
Agriculture Research Service, Brawley, Calif. Imperial Valley Conservation Research Center.
M. T. Kaddah.
Soil Science, Vol 118, No 2, p 102-108, August 1974. 3 fig, 2 tab, 21 ref.

Descriptors: *Sediment distribution, *Particle size, *Hydrometers, *Stokes Law, *California, Soil properties, Soil physics, Silts, Clays.
Identifiers: *Imperial Valley(Calif), Bouyoucos hydrometer, Casagrande's method, Pipet method.

The hydrometer method usually has been tested against the pipet method for determination of total silt and clay (50-2 microns, less than 2 microns in diameter). For analysis of more silt and clay size fractions (i.e., 50-20, 20-10, 10-5, 5-2, 2-1, less than

1 micron), this study showed no difference between the two methods. The hydrometer method also gave, by subtraction, results comparable to the wet sieve method for particles greater than 43 and 53 microns. Frequent insertion and removal of the hydrometer from suspension, as needed in detailed particle-size analysis, did not affect the accuracy of the hydrometer method. Hydrometer specifications were used to calculate and plot hydrometer readings versus particle diameter at different time intervals after initiation of sedimentation. The procedure facilitated calculation of particle size distribution. (Gibb-ISWS)

Engineering-Science, Inc., Berkeley, Calif.
J. K. H. Ateshian.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 100, No IR3, p 293-307, September 1974. 7 fig, 5 tab, 8 ref, 2 append. EPA Contract 68-01-0755.

Descriptors: *Erosion control, *Soil erosion, *Rainfall, *Soil conservation, *Drainage, Overland flow, Erosion, Rainfall intensity, Rainfall disposition, Graphical analysis, Maps.
Identifiers: Soil loss.

The rainfall erosion index in the Universal Soil-Loss Equation was intensively studied using an analytic approach. Simplified procedures for its computation were developed and presented. The methodology ties together the eastern and western portions of the United States and is based primarily upon the rainfall distribution curves as published by the Soil Conservation Service and secondarily upon the kinetic energy and rainfall intensity relationship. With this improvement the Soil-Loss Equation may become truly 'universal.' (Yang-ISWS)

ATLANTIC CONTINENTAL SHELF AND SLOPE OF THE UNITED STATES--SEDIMENT TEXTURE OF THE NORTHEASTERN PART,
Geological Survey, Washington, D.C.
J. Schlee.
Available from Sup Doc, GPO, Washington, DC 20402, Price $4.05 including plates. Professional Paper 529-L, 1973. 64 p, 39 fig, 6 plate, 154 ref.

Descriptors: *Bottom sediments, *Continental shelf, *Atlantic Ocean, Distribution patterns, Sediment sorting, Sedimentology, Provenance, Particle size, Marine geology, *Northeast U.S.

The Atlantic continental margin of the northeastern United States is covered by fine to medium quartzone sand out to the shelf edge and by silt and clay on the continental slope and rise. On the glaciated part of the continental shelf (Gulf of Maine), sediment is mainly till-like mixtures of sand, gravel, silt, and clay; in basins of the gulf, pelagic silty clay covers older glacial deposits. Adjacent to the rocky shelf around Nova Scotia, coarse gravel is prevalent. The southern limit of glaciation is marked by a fringe of gravelly sand (former outwash deposits) and sandy gravel. The shelf south of the glacial limit is mainly a sand-covered plain transected by wide channels carved by a dendritic drainage pattern. Relict terraces inherited from lower stands of sea level are also prevalent in this area, particularly on the outer shelf. Sandy debris has been redistributed so widely over Georges Bank and the inner shelf elsewhere, that the channelways for glacial melt water are now buried. Fine-grained sediment on the shelf is mostly confined to inshore areas such as estuaries, bays, and sounds. The bathymetric transition to the deep sea is marked by a change to finer grained sediment on the continental slope. The sand fraction lessens and changes from dominantly quartz and feldspar to mainly Foraminifera tests. (Knapp-USGS)

RECENT SEDIMENTS OF BLACK SEA,
Woods Hole Oceanographic Institution, Mass.
D. A. Ross, and E. T. Degens.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E.T., and Ross, D.A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 183-199, 1974. 11 fig, 1 tab, 46 ref. NSF Grant GA-1659.

Descriptors: *Sedimentation, *Density stratification, *Sedimentation rates, Pleistocene epoch, Bottom sediments, Water chemistry, Sulfides, Salinity.
Identifiers: *Black Sea.

The deep-water sediments deposited during the last 25,000 years in the Black Sea are distinguished by three sedimentary units: unit 1--carbonate-rich microlaminated sediment, deposited within the last 3,000 years; unit 2--organic-rich microlaminated sediment commonly about 40 cm thick, deposited between 3,000 and 7,000 years B.P. and unit 3--alternately light and dark lutite, deposited between 7,000 and at least 25,000 years B.P. Generally, the sedimentation rates ranged from about 40 to 90 cm/1,000 years during the deposition of unit 3, and averaged about 10 cm/1,000 years during the deposition of units 1 and 2. These changes in sedimentation rate coincide with major changes in the environmental conditions of the Black Sea. Unit 3 was deposited during a period when the Black Sea was changing (because of Pleistocene sea-level changes) from a marine to a freshwater aerobic lake. At about 9,000 years B.P. and continuing to 7,000 years B.P., seawater occasionally spilled over the Bosporus and entered the Black Sea. The entrance of this water began the change from the freshwater well-aerated phase to the marine stagnant phase. At about 7,000 years B.P. the H2S zone was well established in the deep basin, and deposition of unit 2 began there. On the basis slope the deposition of unit 2 began about 6,200 years B.P., because of the rising H2S-oxygen boundary. Sedimentation rates dropped as a result of rising sea level in the Black Sea which permitted river-carried sediment to be trapped in the estuaries or on the shelf. About 3,000 years ago the conditions that presently characterize the Black Sea were reached. (Knapp-USGS)
W74-12380

MINERALOGY AND PETROLOGY OF BLACK SEA BASIN SEDIMENTS,
Heidelberg Univ. (West Germany). Sediment Research Lab.
G. Muller, and P. Stoffers.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A. editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 200-248, 1974. 22 fig, 10 tab, 40 ref, append.

Descriptors: *Sedimentation, *Provenance, Pleistocene epoch, Sea water, Bottom sediments, Mineralogy, Sands, Carbonates, Mud, Clay minerals, Sedimentology.
Identifiers: *Black Sea.

The origin and modes of transportation and deposition of inorganic sedimentary material of the Black Sea were studied in approximately 60 cores. The sediment derived from the north and northwest (especially from the Danube) has a low calcite-dolomite ratio and a high quartz-feldspar ratio. Rock fragments are generally not abundant; garnet is the principal heavy mineral and illite is the predominant clay mineral. Sediment carried by Anatolian rivers is characterized by a high calcite-dolomite ratio and a low quartz-feldspar ratio.

Rock fragments are abundant; pyroxene is the principal heavy mineral and montmorillonite is the predominant clay mineral. Clay content increases from the coasts toward two centers in the western and eastern Black Sea basin. Illite is the most common clay mineral. In almost all cores, a rhythmic change of the montmorillonite-illite ratio with depth was observed. These changes may be related to the changing influence of the two provinces during the Holocene and late Pleistocene. The carbonate content of the contemporary sediments ranges from 5% to 65%. It increases from the coast to a maximum in two centers in the western and eastern basin. The contemporary mud sedimentation is governed by two important factors: (1) the deposition of terrigenous allochthonous material of low carbonate content originating from the surrounding hinterland (northern and southern source areas), and (2) the autochthonous production of large quantities of biogenic calcite by coccolithophores during the last period of about 3,000-4,000 years. (Knapp-USGS)
W74-12381

MODERN SEDIMENTATION IN BLACK SEA,
Akademiya Nauk SSSR, Gelendzhik. Institut Okeanologii.
K. M. Shimkus, and E. S. Trimonis.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 249-278, 1974. 16 fig, 23 tab, 62 ref.

Descriptors: *Bottom sediments, *Particle size, *Mineralogy, *Sedimentology, Provenance, Distribution patterns, Sediment sorting, Kaolinite, Illite, Montmorillonite.
Identifiers: *Black Sea.

The deep-water sediments of the Black Sea are mainly fine grained; coarse material is found locally on the basin slope and deeper areas, especially in the southeastern part of the basin. The latter accumulation is material deposited by turbidity currents. There is a grain-size differentiation of clay minerals; kaolinite occurs nearer the coasts; montmorillonite and illite are more common in the deeper areas. The grain size and mineral distribution are controlled by many factors, including inflow of terrigenous material, original size of source material, production of biogenic carbonate, action of currents, and redeposition by slumping and turbidity currents. (Knapp-USGS)
W74-12382

SOME CHARACTERISTICS OF CARBONATE SEDIMENTATION IN BLACK SEA,
Akademiya Nauk SSSR, Gelendzhik. Institut Okeanologii.
E. S. Trimonis.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 279-295, 1974. 10 fig, 3 tab, 28 ref.

Descriptors: *Deposition(Sediments), *Carbonates, *Sedimentation, Limestones, Suspended load, Chemical precipitation.
Identifiers: *Black Sea.

About 10.8 million tons per year of detrital carbonate material is brought into the Black Sea in suspension by rivers; more than 25 million tons is carried in solution. In addition, authigenic carbonates, principally mollusk shells and coccoliths, are formed within the Black Sea. The grain-size of carbonate sediments varies as a function of composition and origin. Carbonate material consists mainly of low-magnesium calcite and aragonite. Biogenic prosesses are the major factor in modern carbonate sedimentation. Terrigenous carbonate material also is significant in the general process of carbonate sedimentation. (Knapp-USGS)
W74-12383

GRADED BEDDING IN RECENT BLACK SEA TURBIDITES: A TEXTURAL APPROACH,
Institutul Geologic, Bucharest (Rumania).
D. C. Jipa.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 317-331, 1974. 18 fig, 20 ref.

Descriptors: *Bottom sediments, *Turbidity currents, *Sediment sorting, *Particle size, *Sediment transport, Density currents, Sedimentation, Deposition(Sediments), Currents(Water), Stratigraphy.
Identifiers: *Black Sea.

Several types of graded bedding are recognized in sediments collected from the central Black Sea. The grading types, matrix content, grain-size distribution, and pulsations in the vertical size distribution provide data on the dynamics of the turbidity currents that deposited these sediments. Several features indicate that the evolution of the sedimentation process of the Black Sea graded beds was governed mainly by the decreasing energy of the transporting turbidity currents. This conclusion is substantiated by: (1) the decreasing content of sand toward the top of the bed and the increasing content of fine-sized particles; (2) increasing percentage of a population representing the increasing importance of the suspended load versus bed load; and (3) matrix size grading and the increasing percentage of matrix present toward the top of the bed. (Knapp-USGS)
W74-12384

MASS PHYSICAL PROPERTIES OF SOME WESTERN BLACK SEA SEDIMENTS,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Lab.
G. H. Keller.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 332-337, 1974. 4 fig, 15 ref.

Descriptors: *Bottom sediments, *Organic matter, *Sedimentology, Density stratification, Sampling, Stratigraphy, Provenance, Sedimentation.
Identifiers: *Black Sea, Sapropels.

Three distinct and unusual sedimentary units can be traced over large parts of the Black Sea basin. These units extend at least through the cored interval (2 m) and they have mass physical properties distinct from those of other marine sediments. On the abyssal plain, the uppermost unit (0-18 cm) consists of alternate microlaminated layers of coccolith and sapropelic mud characterized not only by its composition, but by its high carbonate content (44-81 percent) and intermediate specific gravities of grains (2.19-2.47). The underlying unit (18-62 cm) is composed of highly organic material with properties more closely related to those of peat than those of deep-sea sediments. Water content as high as 700 percent, porosities of 95 percent, unit weights as low as 1.07 g/cc, and grain specific gravities of 1.89-2.33 typify this unusual deposit. Unit 3 (62 cm to bottom of cored interval) is characterized by light- and dark-gray silty clay, relatively high specific gravities of grains (2.57-2.74), and remarkably low shear strengths (10-38 g/cc) weights (1.25-1.50 g/cc). (Knapp-USGS)
W74-12385

BOTTOM PHOTOGRAPHS OF BLACK SEA,
Woods Hole Oceanographic Institution, Mass.
A. C. Vine.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 338-346, 1974. 11 fig, 7 ref.

Descriptors: *Bottom sediments, *Photography, Sedimentology, Sedimentation, Sedimentary structures, Sounding, Acoustics, Equipment.
Identifiers: *Black Sea, *Underwater photography.

Bottom photographs from six locations in the anaerobic deep central parts of the Black Sea show no marine life or evidence of bottom activity of marine life, but they do show considerable evidence of small debris. Most of the bottom appears mottled, suggesting a closely spaced, uniformly random grouping of small sediment dumps. Some photographs show slight patterns, ranging from a few centimeters to 1 m long, that perhaps result from the descent to the bottom of floating debris, vegetation, or dead marine life. Several different types of lineal patterns on the bottom indicate the action of weak bottom currents. Stereo photos show two lineal-type patterns with no observable relief. These patterns presumably are due to differences in reflective power or to very small textural changes. (Knapp-USGS)
W74-12386

GEOCHEMISTRY OF SEDIMENTS FROM ELEVEN BLACK SEA CORES,
Durham Univ. (England). Dept. of Geochemistry.
D. M. Hirst.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 430-455, 8 tab, 58 ref, append. NSF Grant GA-1659.

Descriptors: *Geochemistry, *Bottom sediments, Statistics, Sampling, Cores, Clay minerals, Provenance, Carbonates, Stratigraphy, Organic matter, Silicates, Sulfur, Sulfides.
Identifiers: *Black Sea, *Factor analysis.

The interrelations among 25 chemical variables in 172 samples of Black Sea sediments were assessed by means of factor analysis. The main variance is controlled by the relative amounts of silicate phases, carbonate, organic carbon, and sulfur in the sediments, and is related to the Eh and pH of the depositional environment. Part of the variance is ascribed to variation in the clay mineralogy and is related to a southern and southwestern provenance for chlorite and montmorillonite. Trend-surface analyses of factor scores indicate both areal and stratigraphic variations in the chemistry, which are notable on the bipolar carbonate-silicate factor and the factor containing loadings for carbon and related elements. Both carbonate and organic carbon are relatively concentrated in sediments from the central Black Sea, particularly in the upper most 100-200 cm of the cores. A threefold stratigraphy comprises a thin recent carbonate sequence overlying sapropelic muds, which in turn overlie more normal lutite. This stratigraphy is recognized most easily in cores from the central Black Sea. Near the southern margin, it is obscured by a high rate of accumulation of detrital silicates; in the eastern Black Sea, deposition of turbidites produces nonstandard sequences. (Knapp-USGS)

ORGANIC ANALYSES OF BLACK SEA CORES,
California Univ., Berkeley. Space Sciences Lab.
B. R. Simoneit.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 477-498, 1974. 11 fig, 11 tab, 25 ref. NASA Grant NGL-05-003-003.

Descriptors: *Organic matter, *Bottom sediments, Organic compounds, Cores, Sampling, Chemical analysis.
Identifiers: *Black Sea, Sapropels.

Samples from three Black Sea coring sites (1461, 1462, and 1474) were analyzed for their solvent-soluble organic matter. The organic carbon content of these samples ranges from less than 1 percent to about 20 percent; significant amounts of carbonate, terrigenous clays, and terrestrial organic detritus are present. Up to 2.5 percent of the samples is solvent extractable, and the extracts consist mainly of carboxylic acids and hydrocarbons, some with large amounts of elemental sulfur. The hydrocarbons consist of mainly normal alkanes, isoprenoidal hydrocarbons--mainly phytadienes, phytane, and pristane; and a series of isoalkanes. In the high-resolution mass spectrametric and GC/MS data, there also were indications for the presence of steroidal and triterpenoidal compounds. The carbon-rich sample from the 40-cm level at site 1461 yielded an extract consisting mainly of sterols and fatty acids. Its hydrocarbon content is predominantly olefinic alkanes and polycyclic material. (Knapp-USGS)
W74-12389

FORMS OF IRON IN SURFACE LAYER OF BLACK SEA SEDIMENTS,
Akademiya Nauk SSSR, Moscow. Institut Okeanologii.
A. G. Rozanov, I. I. Volkov, and T. A. Yagodinskaya.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 532-541, 1974. 4 fig, 2 tab, 12 ref.

Descriptors: *Iron, *Bottom sediments, *Geochemistry, Oxidation, Reduction(Chemical), Organic matter, Dissolved oxygen, Pyrite, Sulfides, Hydration.
Identifiers: *Black Sea.

Early diagenesis of iron under oxidizing and reducing conditions in sediments of the Black Sea was studied in detail. Generally, reactive iron in sediments increases in the direction from the coastal areas to the center of the sea. The mineral forms of reactive iron (hydrates, silicates, sulfides) are strongly affected by the kind and amount of organic matter in the sediments. Reducing conditions exist not only in sediments of the deep basin but with exception of the upper few centimeters, they also are present in shallow-water sediments which are laid down under oxidizing conditions. (Knapp-USGS)
W74-12390

BEHAVIOR OF MOLYBDENUM IN PROCESSES OF SEDIMENT FORMATION AND DIAGENESIS IN BLACK SEA,
Akademiya Nauk SSSR, Gelendzhik. Institut Okeanologii.
M. F. Pilipchuk, and I. I. Volkov.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 542-553, 1974. 8 fig, 4 tab, 44 ref.

Descriptors: *Molybdenum, *Bottom sediments, *Oxidation-reduction potential, Distribution patterns, Sulfides, Dissolved oxygen, Geochemistry, Diagenesis, Adsorption, Chemical precipitation.
Identifiers: *Black Sea, Sapropels.

In the Black Sea the distribution of molybdenum is markedly affected by redox reactions. Sediments deposited under oxidizing conditions can scavenge molybdenum by coprecipitation with manganese oxides and hydroxides. In contrast, the high molybdenum content in sediments of the H2S zone can be attributed to the diagenetic fixation of molybdenum to organic matter and also to incorporation of molybdenum in pyrite. Enrichment of molybdenum during the lifetimes of planktonic organisms is not significant in accounting for the high concentrations of this element in the organic-rich sediments. (Knapp-USGS)
W74-12391

ISOTOPIC AND ELEMENTAL GEOCHEMISTRY OF BLACK SEA SEDIMENTS,
Bureau of Mineral Resources, Canberra (Australia).
J. A. Cooper, E. J. Dasch, and M. Kaye.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 554-565, 1974. 7 fig, 6 tab, 34 ref.

Descriptors: *Bottom sediments, *Provenance, *Geochemistry, Radioisotopes, Stable isotopes, Strontium radioisotopes, Lead radioisotopes.
Identifiers: *Black Sea.

In the Black Sea, sediment provenance approximates average continental material. Except for basaltic rock, sediment sources for the Black Sea are extremely varied, both lithologically and temporally. Thus, excluding variations in trace elements, the chemistry of Black Sea sediment on a carbonate-free basis closely approaches values for an average cratonic shale. Varied continental provenance also is defined by lead-isotope ratios, which are closer to numbers obtained from crustal rock than from oceanic-basaltic, more deeply derived rock. Additionally, strontium-isotope composition of the sediments reflects moderately radiogenic sources; the range and average for the Black Sea Sr ratios are close to those of deep-sea detritus from the western North Atlantic. QUANTIFICATION OF SHORELINE MEANDERING,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
L. Vincent.
Available from NTIS, Springfield, Va. 22161 as AD-773 050, Price $4.00 printed copy, $2.25 microfiche. Technical Report No 7 for Office of Naval Research, Geography Programs, November 1973. 89 p, 16 fig, 18 tab, 6 append. ONR Nonr-N00014-69-A-0060-0006.

Descriptors: *Meanders, *Beaches, *Sand waves, Topography, Geomorphology, Statistical models, Water circulation, Littoral drift, Beach erosion, Waves(Water), Surf, *North Carolina.
Identifiers: *Hatteras Island(NC).

Rhythmic shoreline topography, termed shoreline meandering, was investigated along Hatteras Island, North Carolina, using aerial photography. Two types of meanders were distinguished on the basis of form geometry. The temporal and spatial variabilities of meandering were quantified using spectral and multivariate techniques. In a model of the beach cycle in the nearshore zone, the occurrence of small meanders is a function of storm-current velocity, nearshore slope, and a post-storm balance of onshore and offshore sand transport (due to the presence of topography-forced nearshore circulation). The model explains the observed characteristics of small, rhythmic meanders. Large meanders are explained as regions of severe storm erosion caused by wave convergence over long, offshore shoals. EROSION AND SEDIMENT YIELDS IN MOUNTAIN WATERSHEDS OF THE TRANSVERSE RANGES, VENTURA AND LOS ANGELES COUNTIES CALIFORNIA--ANALYSIS OF RATES AND PROCESSES,
Geological Survey, Menlo ark, Calif.
K. M. Scott, and R. P. Williams.
Water-Resources Investigations 47-73, June 1974. 66 p, 12 fig, 8 tab, 54 ref.

Descriptors: *Erosion, *Sediment yield, *California, *Mass wasting, Sedimentation, Alpine, Mountains, Geology, Geomorphology, Topography, Slopes.
Identifiers: *Transverse Ranges(Calif).

Erosion rates in mountain watersheds of the western Transverse Ranges of Ventura County, California, range from very low values to values as high as those recorded anywhere for comparable bedrock erodibilities. A major reason for this extreme variability is the high degree of tectonic activity in the area--watersheds are locally being uplifted by at least as much as 25 feet per 1,000 years. The maximum extrapolated rate of denudation is 7.5 feet per 1,000 years. Evidence of large amounts of uplift continuing into historic time includes structurally overturned strata of Pleistocene age, active thrust faulting, demonstrable stream antecedence, uplifted and deformed terraces, and other results of base-level change seen in stream channels. The importance in the area of debris flows, mudflows, and mass movements is also a reflection of the active tectonic setting of the Transverse Ranges. Lateral supply of sediment to stream channels is a relatively continuous process, accomplished during the dry season by dry sliding, in addition to wet-season contributions from overland flow and mass movements. During periods without major storms, stream channels undergo continuous fill. Then, during a storm of high recurrence interval, channel-bed material is mobilized and dispersed in large part by debris flows--coarse granular slurries, some of which are induced by mass movements triggered by the storm. Channels undergo substantial net scour, accomplished by removal of bed material in debris flows and by scour during recession flow. Valley-side slopes are undercut by bank erosion, and a new cycle of channel infilling by hillslope processes is initiated. (Knapp-USGS)

Biochim Biol Sper. Vol 10, No 1, p 39-50. 1971/1972. Illus. (English summary).
Identifiers: *Chromatography, *Italy, Lipids, *Muds, *Thermal properties, Organic matter.

In follow-up investigations on the lipidic composition of muds of different Italian thermal baths, the acetone soluble lipid fraction and the total lipids extracted from a mud sample from Lacco Ameno (Ischia, Italy) after Folch's method were studied by thin layer and gas-liquid chromatography (GLC). They consisted of 32.9% phospholipids and pigments (carotenoids), 24.1% triglycerides, 12.1% di- and monoglycerides, 18% hydrocarbons C30-C38, 6.7% sterols, 4.4% free fatty acids and 1.8% alcohols and terpenes. The presence of cholesterol (20.5%), beta-sitosterol (30%), stigmasterol (15.3%), campesterol (7.5%) and an unknown sterol (26.7%) was verified. The triterpenic alcohols were alpha- and beta-amyrine (74.3%), cycloarthanol (15.8%) and 24-methylenecycloarthanol (9.9%). The maturation-technique carried out in Ischia was questioned.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Computer programs, *Water chemistry, *Equilibrium, *Mineraology, Solubility, Water analysis, Chemical analysis, Water temperature, Hydrogen ion concentration, Oxidation-reduction potential, Thermodynamics, Ions, Aqueous solutions.

A computer program (SOLMNEQ) computes the equilibrium distribution of 162 inorganic aqueous species generally present in natural waters over the temperature range of 0 deg to 350 deg C from reported chemical analyses, temperature, pH, and Eh. Interpolated dissociation constants of the aqueous complexes and computed activity coefficients are also used in these computations. States of reactions of aqueous solutions with respect to 158 solid phases (minerals) are computed from the distribution of aqueous species and an internally consistent set of thermodynamic data. Ionic proportions and subsurface temperature estimates are also computed. The program is written in PL/I for the IBM 360 computer. (Knapp-USGS)

AN IMPROVED METHYLTHYMOL BLUE PROCEDURE FOR AUTOMATED SULFATE DETERMINATION,
Georgia Univ., Athens. Inst. of Ecology.
R. J. Watrous, and J. E. Douglass.
Analytical Chemistry, Vol 46, No 9, p 1329-1331, August, 1974. 2 fig, 2 ref. *Interagency Agreement AG-199, 40-193-69.

Descriptors: *Sulfates, *Water analysis, Chemical analysis, *Water chemistry, Runoff, Chemistry of precipitation.

Former methods of determining sulfate in streamflow and precipitation on the AutoAnalyzer II were typically noisy and plagued with shifting baselines. The new method proved accurate, easy to maintain in operation, and sensitive to concentrations in the 0-10 mg/1 range. The increased sensitivity was achieved by using a 50-mm flow cell, maintaining a higher flow rate to the colorimeter by the addition of ethanol to the sample stream, and maintaining a low flow cell extraction rate. Detection limits for the procedure were better than 0.020 mg/1, and the percentage accuracy in the 0-1.0 mg/1 range was 1.7 percent error.

FINE STRUCTURE OF LIGHT ATTENUATION AND ITS RELATION TO TEMPERATURE IN THE IRISH SEA,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
D. C. Heathershaw, and J. H. Simpson.
Estuarine and Coastal Marine Science, Vol 2, No 2, p 91-103, 1974. 9 fig, 12 ref.

Descriptors: *Sea water, *Salinity, *Optical properties, *Thermal stratification, On-site tests, Light intensity, Aquatic environment, Light, Evaluation, Attenuation, Temperature, Thermocline, Water properties.
Identifiers: *Irish Sea, Transmittance gradient.

Detailed observations of optical beam transmittance were made in a stratified region of the Irish Sea. The distribution of transmittance was found to be strongly influenced by the temperature structure, significant gradients of both parameters frequently occurring together. Strong minima in transmittance with a horizontal length scale of kilometres were observed in the thermocline. A steady state vertical diffusion model was applied to the data below the thermocline, giving values of the eddy coefficient in this region of 1-6 sq cm. (Humphreys-ISWS)

Frankfurt Univ. (West Germany). Institut fuer Meteorologie und Geophysik.
S. Beilke, and D. Lamb.
Tellus, Vol 26, No 1-2, p 268-271, 1974. 4 fig, 6 ref.

Descriptors: *Absorption, *Sulfur compounds, *Gases, *Ocean water, *Sorption, Oxides, Hydrogen sulfide, Sea water, Chemical properties, Sulfur, Solubility, Water analysis, Analytical techniques, Sulfates, Sulfides, Inorganic compounds, Sinks.
Identifiers: Sulfur dioxide, Desorption, Bubble column experiments, Source, Buffer capacity, Liquid phase, Gas phase, Atmospheric sulfur budget, Terrestrial sulfur budget.

The role which the ocean plays with respect to the atmospheric sulfur budget is unclear. It is known that the ocean is an important source of sulfate-containing particles, but opinions differ on the question: Is the ocean a sink or a source of SO2 and H2S. On the basis of laboratory investigations, the absorption and desorption of SO2 by sea water was discussed. The results of measurements show that the ocean is an SO2 sink and presumably cannot be a direct SO2 source. The possibility of an indirect source of SO2 was considered in a discussion of current literature on H2S-oxidation in ocean water. (Henley-ISWS)

RELATION BETWEEN CHLORINITY AND CONDUCTOMETRIC SALINITY IN BLACK SEA WATER,
Kiel Univ. (West Germany). Institut fuer Meereskunde.
K. Kremling.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E.T., and Ross, D.A. , EDITORS: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 151-154, 1974. 2 fig, 2 tab, 10 ref.

Descriptors: *Water chemistry, *Sea water, *Salinity, *Conductivity, Chlorides, Sulfates, Boron, Fluorides, Calcium, Density stratification.
Identifiers: *Black Sea, Chlorinity.

The chlorinity and conductometric salinity were determined for Black Sea water collected from 14 stations. A regression line compares the differences between conductometric and titrimetric salinities. The determination of chlorinity from conductometric salinity is only possible to 0.01 percent (at a 70-percent confidence limit), because of the ionic variation of Black Sea water. The chlorinity ratios of sulfate, boron, fluoride, and calcium from water at station 1486 are presented. (Knapp-USGS)

INTERSTITIAL WATERS OF BLACK SEA SEDIMENTS: NEW DATA AND REVIEW,
Geological Survey, Woods Hole, Mass.
F. T. Manheim, and K. M. Chan.
In: The Black-Sea--Geology, Chemistry, and Biology; Degens, E.T., and Ross, D.A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 155-180, 1974. 13 fig, 12 tab, 86 ref.

Descriptors: *Pore water, *Bottom sediments, *Salinity, *Water chemistry, Chlorides, Sea water, Brines, Alkalinity, Sulfates, Sulfides, Density stratification.
Identifiers: *Black Sea.

The composition of pore fluids trapped in the bottom sediments of the Black Sea provides information of geochemical and paleohydrologic aspects of the Black Sea during the Holocene and late Pleistocene Epochs. Most piston cores show a decrease in interstitial chlorinity and salinity with depth. This suggests that during isolation of the Black Sea in the last glacial maximum (Neoeuxinian), the Black Sea had a relatively homogeneous chlorinity of about 3.5 g/kg, compared with more than 12 g/kg in present bottom water. Submarine discharge of fresh to brackish groundwaters occurs in several areas. In addition, a saltier subsediment input near the Bosporus channel is possibly a result of upward diffusion of salts from evaporites or continental brines. Diagenetic reactions between pore fluids and sediments result in (1) strong uptake of interstitial potassium and magnesium in nonexchangeable positions in the sediments and (2) loss of sulfate by bacterial reduction. Calcium, bicarbonate alkalinity, decreases with depth in cores, suggesting that both carbonate precipitation and dissolution occur in the deeper sediments. Interstitial waters are the main source of iron, manganese, and phosphorus for iron-manganese concretions on the oxygenated Crimean shelf. Supply from this source corresponds to a growth rate of 5 mm/1,000 years. (Knapp-USGS)

INFLUENCE OF ORGANIC MATERIAL AND PROCESSES OF SULFIDE FORMATION ON DISTRIBUTION OF SOME TRACE ELEMENTS IN DEEP-WATER SEDIMENTS OF BLACK SEA,
Akademiya Nauk SSSR, Moscow. Institut Okeanologii.
I. I. Volkov, and L. S. Fomina.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E. T., and Ross, D. A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 456-476, 1974. 5 fig, 6 tab, 61 ref.

Descriptors: *Geochemistry, *Sulfides, *Trace elements, *Organic matter, Dissolved oxygen, Sorption, Mud, Pyrite, Chemical precipitation, Water chemistry, Molybdenum, Cobalt, Nickel, Copper.
Identifiers: *Black Sea, Sapropels.

The irregular distribution of elements in Black Sea deposits is explained by the geochemical evolution of the basin in postglacial times and is controlled by several factors. Chief among these factors are the change in hydrodynamic regime and the decreasing rate of sedimentation in post-Neoeuxinian time. Subsidiary factors, beginning during Old Black Sea time, include the increasing proportion of organic matter in the sediments; the appearance and stabilization of H2S in bottom water; and the initiation of the Bosporus underflow, which brought Mediterranean water into the Black Sea. Maximum concentrations of Mo, V, Co, Ni, and Cu are found in the sapropelic muds of the Old Black Sea deposits. Cobalt concentrations correlate with sulfide (represented basically by pyrite). Higher concentrations of microelements in the sapropels result from absorption of metals from seawater by organic detritus during settling of the particulates. Accumulation of metals by living planktonic organisms is subordinate. Mo, Co, Ni, and Cu in pyrite from deep-water sediments of the H2S zone were significantly enriched. (Knapp-USGS)

ARGILLIZATION BY DESCENDING ACID AT STEAMBOAT SPRINGS, NEVADA,
Geological Survey, Washington, D.C.
R. Schoen, D. E. White, and J. J. Hemley.
Clays and Clay Minerals, Vol 22, p 1-22, 1974. 11 fig, 6 tab, 49 ref.

Descriptors: *Water chemistry, *Hot springs, *Acids, Sulfides, Sulfates, Acidic water, Clay minerals, *Nevada, Mineralogy, Hydrogen ion concentration, Hydrothermal studies.
Identifiers: *Steamboat Springs(Nev).

Steamboat Springs, Nevada, an area of present-day hot springs, clearly illustrates the genetic dependence of some kaolin deposits on hot-spring activity. Andesite, granodiorite and arkosic sediments are locally altered at the land surface to siliceous residues consisting of primary quartz and anatase, plus opal from primary silicates. These siliceous residues commonly exhibit the textural and structural features of their unaltered equivalents. Beneath the siliceous residues, kaolin and alunite replace primary silicates and fill open spaces, forming a blanketlike deposit. Beneath the kaolin-alunite zone, montmorillonite, commonly accompanied by pyrite, replaces the primary silicates. On the ground surface, the same alteration mineral zones can be traced outward from the siliceous residue; however, hematite rather than pyrite accompanies montmorillonite. Sulfuric acid is the active altering agent. The acid forms from hydrogen sulfide that exsolves from deep thermal water, rises above the water table and is oxidized by sulfur-oxidizing bacteria living near the ground surface. This acid dissolves and percolates downward, destroying most of the primary minerals to produce a siliceous residue. Coincidence of the water table with the downward transition from siliceous residue to kaolin-alunite signifies decreasing hydrogen metasomatism because of dilution of acid by groundwater. Identifiers: Alona, Cladocera, Copepods, *Danube River, *Hungary, Iliocryptus, *Algae, Water chemistry, *Plankton, Monospilus.

Year-round zoological and hydrochemical investigations of a selected section of the Danube River revealed no significant differences between the end points of the section studied, and no noteworthy changes in the dissolved salt content and in the pollution level of the water as compared to investigations conducted in previous years. The minor changes observed in the chemical properties of the water were due to variations in hydrological conditions, and in the assimilation activity of algae. Studies of the planktons of this river section revealed 20 Cladocera sp. and 7 Copepoda sp., of which 3 species (Alona guttata, Iliocryptus agilis, and Monospilus dispar) are new for the Hungarian section of the Danube.--Copyright 1973, Biological Abstracts, Inc.

A NUMERICAL MODEL OF MATERIAL TRANSPORT IN SALT-WEDGE ESTUARIES, PARTS I AND II,
Geological Survey, Tacoma, Wash.
H. B. Fischer, J. D. Stoner, W. L. Haushild, and J. B. McConnell.
Open-file report, 1974. 63 p, 22 fig, 3 tab, 22 ref.

Descriptors: *Stratified flow, *Estuaries, *Saline water intrusion, *Mathematical models, *Computer programs, Washington, Mixing, Path of pollutants, Tides, Currents(Water), Saline water-freshwater interfaces.
Identifiers: *Duwamish River(Wash).

A mathematical model calculates flow in estuaries. Water in a salt-wedge estuary is characterized by an oscillating well-mixed wedge of undiluted ocean-derived water topped by a series of successively more dilute overlying layers. In the wedge the flow is back and forth, with a net landward component to replace water entrained upward into the overlying layer; in the overlying layers the flow also oscillates, but with a net seaward component because of the input of fresh river water and entrained wedge water. The flow is modeled and used as an input to the constituent-transport model. The computer program then is used to determine the advection and dispersion of dissolved constituents and plankton, and their concentrations throughout the system in response to given inputs. Saltwater from Elliott Bay on Puget Sound, Washington, forms a wedge in the lower part of the Duwamish River estuary. The numerical model was used in computing salinity distributions in the estuary and oxygen-use rates and dissolved-oxygen distributions in the salt wedge. Computed spatial distributions of salinity agreed

well with observed distributions during about 30 slack tides in July and August 1968. Analyses of the sensitivity of computed salinity to changes in model input parameters indicate that it changed most in response to changes in the wedge salinity and the location of the wedge toe. (Knapp-USGS)

LITHOFACIES RELATIONS IN THE LATE QUATERNARY NIGER DELTA COMPLEX,
Koninklijke Shell Exploratie en Produktie Laboratorium, Rijswijk (Netherlands).
E. Oomkens.
Sedimentology, Vol 21, No 2, p 195-222, May 1974. 18 fig, 27 ref.

Descriptors: *Deltas, *Quaternary period, *Deposition(Sediments), *Africa, Geomorphology, Coasts, Rivers, Sedimentology, Cores, Boreholes, Evaluation, Stratigraphy, Recent epoch, Marine geology, Investigations.
Identifiers: *Niger River delta, Gulf of Guinea, Coastal deposits, *Lithofacies.

A study of cores from thirty-three coreholes drilled in various parts of the Niger delta has shown tidal channel sand to be the dominant lithofacies type in the uppermost 30 m of the deltaic complex. Below 30 m fluviatile sand becomes predominant. Coastal barrier sand is present in the uppermost 5 m of the present coastal belt, but chances for preservation of this lithofacies appear to be small. The Post-Glacial deltaic sediments can be divided into three units. (1) Alluvial valley-fill sands and conglomerates deposited during the strong Post-Glacial sea level rise. (2) An onlapping complex of lower coastal plain deposits which contains a lower member of fine grained lagoonal and mangrove swamp deposits and an upper member of tidal channel and coastal barrier sands. This complex is thought to have been deposited during the strong Post-Glacial rise in sea level and is locally as much as 25 m thick. (3) An offlapping complex of fluviomarine and coastal deposits which contains a lower member of marine clay and silt and an upper member of tidal channel and coastal barrier sand. The presence of this late Holocene complex indicates that deltaic progradation was resumed as soon as the rapid rise in sea level slowed down. The offlapping complex is locally as much as 35 m thick. (Humphreys-ISWS)

WATER CIRCULATION AND NUTRIENTS IN THE NORTH-WEST IRISH SEA,
Liverpool Univ. (England). Dept. of Marine Biology.
D. J. Slinn.
Estuarine and Coastal Marine Science, Vol 2, No 1, p 1-25, January 1974. 12 fig, 40 ref.

Descriptors: *Ocean circulation, *Sea water, *On-site investigations, *Water quality, Water properties, Thermal stratification, Turnovers, Oceans, Stratification, Thermocline, Salinity, Evaluation, Nutrients, Nitrates, Nitrites, Silicates, Phosphates, Dissolved oxygen, Distribution patterns, Profiles, Hydrologic data, Surveys, Bathythermographs, Chlorophyll.
Identifiers: *United Kingdom(Isle of Man), *Irish Sea, Hydrographic observations.

Results of hydrographic observations made in the Irish Sea to the west of the Isle of Man during 1954-1961 and 1965-1968 were presented and discussed. There was evidence that Atlantic water, although considerably diluted by fresh water runoff, penetrates southwards off the Irish coast. Winter hydrographic conditions tended to exhibit vertical uniformity, but bottom water of higher salinity which was also distinguishable by small temperature differences was sometimes present. During summer, surface warming brought about marked temperature layering which persisted and consolidated in the region characterized by weak tidal currents. Associated with the temperature layering was a well defined pattern of nutrient, dissolved oxygen, and chlorophyll alp distribution. Nitrate virtually dissappeared during the summer and would thus seem to be the limiting nutrient. Coinciding with autumn was a rise in oxygen saturation in nutrients. The highest chlorophyll alpha concentrations, however, tended not to coincide with the highest oxygen saturations. In the deep bottom water of the trough, nutrient concentrations remain high and oxygen saturations low, suggesting that this is due to regenerative processes. Following the breakdown of temperature layering, the autumnal overturn distributes nutrients evenly throughout the water column. Nitrite can be particularly high at this time but declined rapidly as nitrate and other nutrients increased. (Humphreys-ISWS)

Descriptors: *On-site data collections, *Coasts, *Subsurface mapping, *Instrumentation, Evaluation, Exploration, On-site investigations, Basic data collections, Electrical studies, Resistivity, Shores, Oceans, Geophysics, Hydrogeology, Sediment distribution, Discharge(Water), Electronic equipment, Profiles.
Identifiers: *USSR(Odessa region), *Abkhaz ASSR(Gantiadi), Geophysical methods, Black Sea, Caspian Sea.

Areal distribution of bottom sediments and mapping of submarine sources were determined by resistivity measurements and temperature profiling. Data compiled for the Black and Caspian Seas were tabulated for the resistivity of rocks on the sea floor as a function of their density and lithological composition. Electrical prospecting added to the information obtained by drilling on the geological section. Thermometric and electrometric measurements permitted fairly effective mapping of submarine sources and study of their discharge conditions. (Humphreys-ISWS)

MEASUREMENTS OF SAND TRANSPORT BY WIND ON A NATURAL BEACH,
J. N. Svasek, and J. H. J. Terwindt.
Sedimentology, Vol 21, p 311-322, 1974. 8 fig, 10 ref.

Descriptors: *Beaches, *Velocity, *Saltation, *Sediment transport, *Shear stress, *Wind velocity, Sands, Tractive forces, Coastal engineering, Hydraulics, Sedimentology, Moisture content.
Identifiers: *Shear stress velocity, *Critical shear stress velocity, Velocity distribution.

Bagnold's and Kawamura's formula may be used for the calculation of the sand movement on a

natural beach provided the shear stress velocity is greater than 0.4 m/s. Great discrepancies were found between calculated and measured sand transport rates for sheer stress velocity less than 0.4 m/s mainly because of the capillary forces acting on a wet beach. The measured critical shear velocity at the beginning of sand movement on a clean dry beach agrees very well with that predicted by Bagnold's formula. On a dry beach where the sand grains are stuck together, critical shear velocity was found to be about 10% higher. On a wet beach, initial sheer velocity appeared to depend on the moisture content of the surface layer. Grain size is a determining parameter in the critical sheer velocity moisture content relation. When the angle between the wind direction at sea and the dune face is between 15 degrees and 85 degrees the streamlines of the wind will bend in the vicinity of the dune face. In consequence this may influence the direction of sediment movement. (Yang-ISWS)

Identifiers: *Nearshore, *Coastal waters, Flushing, Wave action, Wind effects.

A total 1009 annotated references to the literature on Coastal - Estuarine and Nearshore Processes is presented. The order of presentation is alphabetical by name of first author. A subject outline identifies the geologic, geomorphic, meteorologic and oceanographic references which deal with the highly variable interactions in the estuarine and in the nearshore zone. River discharge is an additional retrieval heading. Included in the subject outline is the identification of references on models, methods, and instruments used in the study of coastal processes. References to studies in various parts of the world are specified in the geographic outline. The list of bibliographies includes references to true bibliographies as well as to documents which contain 50 or more substantive references. An author index is included. The subject index, using descriptors and identifiers, provides rapid access to abstracts dealing with specific subject matter. Closing date for review of the literature for this bibliography was June 15, 1973.

THE BOSPORUS,
Stanford Research Inst., Irvine, Calif.
C. G. Gunnerson, and E. Ozturgut.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E.T., and Ross, D.A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 99-114, 1974. 14 fig, 23 ref.

Descriptors: *Straits, *Water circulation, *Sea water, Currents(Water), Channel morphology, Oceanography, Salinity, Density stratification.
Identifiers: *Bosporus, *Black Sea.

The Bosporus is a strait 31 km long, whose bathymetry suggests the occurrence of past floodflows. Small semidiurnal and fortnightly tides often are obsecured by wind effects which occassionally reverse the southerly surface flow from the Black Sea. At depth, northflowing Mediterranean water maintains the surface salinity of the Black Sea at about 1.75%. The location, thickness, and slope of the boundary layer vary according to the bathymetry, season, and winds. (Knapp-USGS)

In: The Black-Sea--Geology, Chemistry, and Biology; Degens, E.T., and Ross, D.A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 115-126, 1974. 7 fig, 29 ref.

Descriptors: *Water chemistry, *Sedimentation, *Straits, Estuaries, Water circulation, Salinity, Stratification, Stratified flow, Sea water, Density stratification.
Identifiers: *Bosporus, *Black Sea.

Because the Bosporus is the only connection between the fresh to brackish Black Sea and the saline Mediterranean Sea (via the Sea of Marmara and the Dardanelles), it has played a critical role in controlling fluctuations in salinity, oxygen content, sedimentation, sea level, and life in the Black Sea. The original Bosporus valley apparently was cut by a south-flowing river which continued through the Dardanelles and was partly controlled by north-south faults. Upon drowning, the valley became a marine strait, although at times of glacial lowering of sea level it acted as a marine spillway or resumed its subaerial-valley condition with a central drainage divide. Its bedrock channel is at least 100 m below present sea level. The interface between the northward, saline bottom current and the southward, freshwater surface current slopes northward at an angle which is a function of the two densities and the hydraulic head. When sea level in only moderately high, the interface touches bottom south of the northern exist, and the saline bottom water is returned southward by the surface current. Only when sea level is higher than today can large quantities of Mediterranean water enter the Black Sea and bring salt and oxygen to the deep Black Sea bottom. (Knapp-USGS)

EVOLUTION OF SOME MARSHES OF EASTERN PRISAYANYE, (IN RUSSIAN),
Irkutskii Gosudarstvennyi Universiteit (USSR). Dept. of Botany.
I. G. Lyakhova.
Biol Nauki. Vol 16, No 3, p 70-74. 1973.

Identifiers: *Marshes, Peat, *USSR(Eastern Prisayanye).

An analysis was made of contemporary plant life and stratification of peat deposits of marshes of the East Prisayanye (USSR). The considerable marsh character of the land is due to the low relief of the region, abundant flooding and the widely distributed neotectonic movements. The migration of river beds favors the predominant development of low marshes and retards their evolution to a lower level.--Copyright 1973, Biological Abstracts, Inc.

SEASONAL ASPECTS OF THE FIXATION OF BENTHIC EPIFAUNA OF THE INFRATITTORAL LEVEL IN THE ESTUARY OF THE SAINT LAWRENCE RIVER,
University Coll. of North Wales, Bangor. Marine Science Labs.
E. Bourget.
J Fish Res Board Can. Vol 30, No 7, p 867-880, 1973. Illus. English summary.
Identifiers: Abundance, Balanus sp., *Benthos, *Canada, Estuaries, Fauna, Polydora, *St-Lawrence River.

For 2 seasons (May-Oct. 1969, 1970) the dynamic aspects of the settlement of benthic epifauna on hard substrata were studied. The stations were distributed on a 200-km distance, the salinity gradient ranging from 15-27%. Although over 60 spp. were identified on the plates, the analysis shows that only 3 of these are abundant: Polydora ciliata, Balanus balanoides, and B. crenatus. In general, the settlement period of the species is very short and most of the settling processes are concentrated in June, July, and Aug. The populations reached a peak of abundance during settlement and decreased regularly afterwards. This decrease is due mainly to intraspecific and interspecific competition for space, accumulation of sediment and hydrodynamic factors in autumn. The marked physical seasonality of this subarctic environment, more than true biotic succession, is reflected in the development of the community; during the summer, the community is biologically accommodated whereas in autumn and winter it is physically controlled.--Copyright 1973, Biological Abstracts, Inc.

MARITIME SANDS,
B. Pettersson.
Acta Phytogeographica Suecica, Vol 50, p 105-110, 1965. 3 fig, 16 ref.

Descriptors: *Beaches, *Sands, *Vegetation, Shores, Lichens, Grasses, Pine trees, Fungi, Coasts, Dunes.
Identifiers: *Maritime sands, Sweden, Baltic Sea coasts, Bryophytes, Calciocolous therophytes.

Knowledge of the sand vegetation of Swedish shores is fragmentary. The part of the beach washed by waves is called foreshore and is rather flat or gently sloping. Next to the sea there is a desert-like belt of varying breadth with algal drift--quite large stones are often floated onto the beach by means of Fucus vesiculosus attached to them. Above the foreshore a ridge of sand, the foredune, is often formed on exposed shores and built up by sand-collecting plants, above all Ammophila arenaria and Elymus arenarius. Mobile dunes (formed by wind) have often once been devoid of vegetation, but are colonized especially by Ammophila in later stages when factors, responsible for sand mobility, have been eliminated. The earliest colonizers of the naked sand are crustaceous lichens, especially Lecidea uliginosa, L. granulosa, and Stereocaulon condensatum, accompanied by bryophytes, especially Ceratodon purpureus and Cephaloziella sp. In most districts, the foredune is succeeded inland by relatively smooth dry sandy fields, a type of heath inhabited by

several continental species and many southern calcicolous therophytes characteristic of 'alvar' vegetation on Gotland and Oland. The vegetation along the south and southeast coasts of the Baltic Sea is described. (Jones-Wisconsin)

APPLICATION OF ERTS-1 DATA TO THE PROTECTION AND MANAGEMENT OF NEW JERSEY'S COASTAL ENVIRONMENT,
Earth Satellite Corp., Washington, D.C.
R. L. Mairs, R. T. Macomber, D. Stanczuk, F. J. Wobber, and R. S. Yunghans.
Available from NTIS, Springfield, Va 22161 as N74-16009, Price $5.00 printed copy; $2.25 microfiche. Progress Report No 304 to NASA Goddard Space Flight Center for the period July-December 1973. 47 p, 7 fig, 4 tab, append.

Descriptors: *Remote sensing, *Satellites(Artificial), *Mapping, *Land use, Coasts, *New Jersey, Environment, Data collections, Monitoring, Flood plains, Waste disposal, Path of pollutants.
Identifiers: ERTS.

Data from Earth Resources Technology Satellite (ERTS) has proven of value to New Jersey in monitoring dispersion and extent of offshore wastes disposal practices, detecting changes (primarily development) in the coastal zone, monitoring large scale circulation patterns in the nearshore zone, and in delineating coastal land resources and ecozones. ERTS is of greatest value to the State in terms of: land use change detection; waterfowl game management; offshore waste disposal; and floodplains mapping. (Knapp-USGS)

HYDRAULIC CONSTANTS OF TIDAL ENTRANCES 1: DATA FROM NOS TIDE TABLES, CURRENT TABLES AND NAVIGATION CHARTS,
Florida Univ., Gainesville. Coll. of Engineering.
M. P. O'Brien, and R. R. Clark.
Available from NTIS, Springfield, Va. 22161 as AD-773 627, Price $3.75 printed copy, $2.25 microfiche. Coastal and Engineering Laboratory, Technical Report No 21, November 1973. 47 p, 7 fig, 6 chart, 5 tab, 22 ref. ONR Contract N00014-68-A-0173-0020.

Descriptors: *Tidal waters, *Tidal effects, *Inlets(Waterways), *Discharge coefficient, Currents(Water), Roughness(Hydraulic), Discharge(Water), Tidal streams, Tides.
Identifiers: Salinity gradient.

The flow in tidal inlets may be analyzed by means of empirical coefficients which are defined by a simple flow relationship. Methods commonly used in analyzing flow through tidal entrances on sandy coasts make assumptions regarding the geometry of the inlets and related flow regime which depart substantially from real flow conditions. Evaluation of the published data pertaining to the hydraulics of entrances indicates that the data are sufficiently accurate and representative to permit the determination of discharge coefficients and to identify categories of entrances with characteristic flow regimes. (Humphreys-ISWS)

PARTICLE SIZE DISTRIBUTION AND SMALL-SCALE BED-FORMS ON SAND WAVES, CHESAPEAKE BAY ENTRANCE,
Old Dominion Univ., Norfolk, Va. Inst. of Oceanography.
J. C. Ludwick, and J. T. Wells.
Available from NTIS, Springfield, Va. 22161 as AD-774 947, Price $4.50 printed copy, $2.25 microfiche. Technical Report No 12, January 15, 1974. 116 p, 24 fig, 14 tab, 66 ref. NR 388-098. ONR-GP Contract No N00014-70-C-0083.

Descriptors: *Sand waves, *Chesapeake Bay, *Sediment transport, Sedimentary structures, Sediment sorting, Statistical methods, Variability, Particle size, Provenance, *Virginia.

The relationship between sediment texture and topography was studied along five series of sand waves in Chesapeake Bay entrance, Virginia. Two types of sand waves are present: asymmetrical, migrating sand waves have coarse sediment on crests and fine in troughs, and near-symmetrical, stationary sand waves have fine sediment on crests and coarse in troughs. In general, bimodal sediment is present on crests of migrating sand waves and in troughs of stationary sand waves. There is a progressive decrease in percentage of bimodal samples in the Bay entrance sand wave field with distance to the southeast, the direction of net sediment transport. Analysis of variance verifies textural trends. At times when currents are of sufficient strength to move all sediment sizes, brown coarse sand is carried from a source northwest of the sand wave field and mixed with the predominant gray fine sand. As velocities decrease, coarser sediment is deposited. A winnowing process continues to move finer sizes such that texturally distinct crests and troughs result. Observations by SCUBA divers reveal the widespread occurrence of small-scale bed-forms surmounting sand waves. Analysis of variance shows these trends insufficient to obscure observed sand wave textural trends. (Knapp-USGS)

THE SALINITY GRADIENT AND VEGETATION IN THE SAUGATUCKET RIVER ESTUARY,
Rhode Island Univ., Kingston. Coll. of Resource Development; Rhode Island Univ., Kingston. Dept. of Botany.
E. M. Smith, and R. D. Wood.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-74-10165, $2.75 in paper copy, $2.25 in microfiche. Rhode Island Univ. Marine Technical Report Series No 6. 5 p, 3 fig, 1 tab, 3 ref.

Descriptors: *Salinity, *Vegetation, *Estuaries, Saline water-freshwater interfaces.
Identifiers: *Saugatucket River(RI), South Kingstown(RI), Point Judith Pond(RI), Salinity dilution.

The Saugatucket River in South Kingstown, Rhode Island, discharges into Point Judith (Salt) Pond, diluting the seawater along the estuary. To locate the region of greatest salinity change, 20 stations were established. On November 6, 1971, water samples were taken at low and high tide at the lower four stations. Samples were also taken at low water and four hours after low water at stations 8-16 on November 11 and at stations 1-7 on November 12. The delayed sampling was done to check the water at the period of maximum dilution. The plant life, growing and healthy at the stations, was recorded. Water samples were titrated for salinity. The plant life provides a continuously operating salinity monitoring system. Results of the work in Point Judith Pond show that the greatest dilution (change in salinity) is in the mouth of the Saugatucket River from a point just above the Silver Lake Road bridge to the point where the river empties into Upper Pond and plant life occurs in predictable zones along this estuary, species being linked to the overall salinity range. 3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

CONCEPTUAL DESIGN STUDY OF A 200 MILLION GALLON PER DAY VTE/MSF DESALINATION PLANT AND PROTOTYPE MODULE,
Westinghouse Electric Corp., Lester, Pa.
D. Cane, D. M. Giorgione, J. W. Keen, D. L. Moen, and R. L. Nalbone.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 229, $15.00 in paper copy; $2.25 in microfiche. Office of Saline Water, Report INT-OSW-RDPR-74-972, October 1970. 197 p, 16 ref. OSW Contract 14-30-2700.

Descriptors: *Desalination plants, Nuclear energy, *Flash distillation, Nuclear powerplants, Electric power production, *Operating costs, *Capital costs.
Identifiers: Dual-purpose power water plant.

A multiple-effect distillation system which employs an enhanced surface-vertical tube evaporator (VTE) as the basic element was selected as the primary object of this study. The VTE/MSF system was optimized to a system which would produce pure water from seawater at the minimum cost. A conceptual design of a prototype/module was developed which, when built, will demonstrate the feasibility of the 200 MGD plant. The minimum expected capacity of the prototype/module is 2.5 MGD. A conceptual design of a 200 MGD optimized conventional MSF distillation plant was also developed to determine the cost of water using this system. The total estimated capital cost of the MSF plant is $143,601,000 and the water cost with public financing is 43.2 cents/1000 gal. The capital cost of the protytype/module, not including engineering and interest during construction, is estimated to be $4,384,000. It appears that the VTE/MSF system offers a potential reduction of approximately 12% in water cost as compared to the conventional MSF system for large capacity plants (15 MGD and above). A comparison of the capital costs indicates a reduction of approximately 6% in favor of the VTE/MSF system. (OSW)

PROCESS AND APPARATUS FOR MAKING HIGHLY PURE WATER,
Hitachi Ltd., Tokyo (Japan).
K. Izumi, and Z. Tamura.
U.S. Patent No. 3,816,266, 4 p, 2 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 923, No 2, p 672, June 11, 1974.

Descriptors: *Patents, *Evaporation, *Condensation, *Desalination, *Power plants, Fresh water, Equipment.

Hot sea water emerging from an indirect condenser is subjected to flash evaporation and the steam generated by the flash evaporation is condensed to obtain fresh water. The apparatus comprises a plurality of vertical casing assemblies each consisting of a combination of a sea water flash chamber linked with an indirect condenser for receiving pre-heated sea water. The invention is applied to a 600 MW steam-power plant. The steam generated in a boiler is used for rotating a steam turbine and a dynamo to generate electricity. The major portion of the steam is condensed into water in a condenser. Water is obtained from the condenser at the rate of about 1,040 tons/h. Sea water is used as cooling water in the condenser, and at the power plant the sea water is supplied to the condenser at the rate of 69,700 tons/h. (Sinha-OEIS)

METHOD AND APPARATUS FOR SALINE WATER CONVERSION,
P. S. Roller.
U.S. Patent No. 3,814,671, 5 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 923, No 1, p 261, June 4, 1974.

Descriptors: *Patents, *Desalination, *Vaporization, *Condensation, *Evaporation, Saline, Fresh water, Scaling.
Identifiers: Scale formation, Alkaline bicarbonate, Alkaline scale.

Saline water containing scale-forming alkaline bicarbonate is indirectly heated while avoiding alkaline scale, due to the presence of recycled CO2. The heated saline water is flash vaporized and alkaline bicarbonate thermally decomposed, forming CO2, a precipitate of alkaline scale compound and flashed saline water. The flashed vapor with included CO2 is condensed and the CO2 released from hot condensate as evolved CO2; the latter is recycled to the saline water, while discharging excess evolved CO2. Precipitate of alkaline scale compound is separated from flashed saline water and employed as nucleant for precipitate formed in flash vaporization, whereby the thermal decomposition is accelerated. The flash vaporization may be conducted in stages, a slight residual of alkaline bicarbonate in the flashed saline water being thereby reduced to an indefinitely small value. The flashed saline water is evaporated in a multi-stage flash evaporator; or this combined with a surface heat evaporator forming concentrated brine and fresh water at high yield. (Sinha-OEIS)

SURVEY OF WEATHER MODIFICATION IN THE SOVIET UNION: 1973,
Arizona Univ., Tucson. Inst. of Atmospheric Physics.
L. J. Battan.
Available from NTIS, Springfield, Va 22161 as PB-222 822, Price $4.75 printed copy; $2.25 microfiche. Scientific Report No 27, May 1973. 51 p, 90 ref. NSF Grant GA-13949.

Descriptors: *Weather modification, *Reviews, *Research and development, Fog, Clouds, Foreign research.
Identifiers: *USSR.

Soviet research in weather modification is reviewed. Hail suppression and precipitation stimulation are major areas of activity in the USSR, and in recent years research on lightning suppression and the use of heat for the dissipation of warm fog in stratus has been studied. The articles surveyed show little evidence that Soviet scientists, unlike their American counterparts, are convinced of the value of randomized experiments in the evaluation of cloud seeding hypotheses and there is no evidence in this literature that Soviet scientists have been tackling the modification of large-scale weather phenomena. (Knapp-USGS)

PROJECT FOGGY CLOUD V, PANAMA CANAL WARM FOG DISPERSAL PROGRAM,
Naval Weapons Center, China Lake, Calif. Research Dept.
R. S. Clark, T. L. Wright, R. W. Evert, R. B. Loveland, and R. E. Northup, Jr.
Available from NTIS, Springfield, Va 22161 as AD-773 473, Price $4.00 printed copy; $2.25 microfiche. Technical Publication 5542, December 1973. 92 p, 51 fig, 17 tab, 19 ref, 2 append.

Descriptors: *Weather modification, *Fog, *Canal zone, Cloud seeding, Monomolecular films, Aircraft, Clouds, Cloud physics, Meteorological data, Tropical regions.
Identifiers: *Fog dispersal, Warm fogs.

Fogs that close the Panama Canal to navigation occur mainly in the Gaillard Cut section of the canal from August through November. In 1972 experiments were conducted along the Gaillard Cut to test a number of different means of dispersing and suppressing fog. Among the techniques tested were seeding by helicopter and fixed-wing aircraft with various fog-dispersal agents, ground-based seeding with various agents, and fog suppression by spreading monomolecular films on the canal surface. Also, tropical cumulus clouds were characterized. Several techniques proved promising enough to warrant further investigation and development. Most promising for the canal area was the suppression of fog by monomolecular films. Also promising were airborne seeding with glycerine and ground-based seeding with charged bubbles. (Knapp-USGS)
W74-12067

FOG CLEARING USING HELICOPTER DOWNDRAFTS: A NUMERICAL MODEL,
Atmospheric Sciences Lab., White Sands Missile Range, N. Mex.
W. S. Nordquist, Jr.
Available from NTIS, Springfield, Va 22161 as AD-771 038 Price $3.75 printed copy; $2.25 microfiche. Research and Development Technical Report ECOM-5527, December 1973. 68 p, 5 fig, 8 tab, 34 ref, append.

Descriptors: *Fog, *Weather modification, *Aircraft, *Mathematical models, Numerical analysis, Cloud physics, Ice fog, Particle size.
Identifiers: *Helicopters, *Fog dispersal.

Clearings can be made in fog when water drops are dispersed from a helicopter, but the downwash from the helicopter rather than the dispersed water might be the cause of the clearing. The feasibility of creating temporary clearings was demonstrated for shallow fogs at high, middle, and low latitudes, stratus cloud decks at low latitude, and ice fog at high latitude. The technique and its effects were simulated using a model which can be expressed mathematically and solved numerically. A one-dimensional (vertical space dimension) parametric model combines the basic meteorological characteristics of a horizontally homogeneous fog existing in a laminar flow regime and the downward flow of air created by a hovering helicopter during the initial stages of downdraft formation. The fog is characterized by vertical profiles of temperature, relative humidity, liquid water content, and horizontal wind speed and direction. The initial model formulation of the downdraft beneath the helicopter is characterized as air being drawn into the plane of the rotor blades horizontally from the environment and being forced downward after the combustion processes of the helicopter engines have increased the temperature and water vapor content. From the initial conditions at the helicopter hover level, the model provides estimates of the temperature, liquid and vapor water content, physical dimensions and speed of the downdraft during its descent. At the level where the downdraft speed becomes zero, the assumed level of maximum downdraft penetration, quantitative estimates are made of the dimensions of areal clearing, temperature, and relative humidity differences between the downdraft and the environment, the horizontal displacement of the downdraft, and the liquid water content at the downdraft base. 3F. Conservation In Agriculture

INTERREGIONAL IMPACTS OF ALTERNATIVE WATER POLICIES FOR IRRIGATION IN WESTERN UNITED STATES,
Wisconsin Univ., Madison. Dept. of Agricultural Economics., and Wisconsin Univ., Madison. Dept. of Forestry.
N. L. Meyer, and D. W. Bromley.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 635, $4.75 in paper copy, $2.25 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report WRC-WIS74-03, June 1974. 133 p, 8 fig, 11 tab, 64 ref, 5 append. OWRT B-057-WIS(4).

Descriptors: *Water policy, *Water allocation(Policy), *Alternative water use, *Regional economics, *Regional development, Water resources development, *Water distribution(Applied), *Farm management, Crop production, Sweet potatoes, Transportation, Idaho, Maine, *Irrigation water, *Cost analysis.
Identifiers: Red River Valley.

An evaluation framework was developed which permits measuring the interregional effects that would result from water resource projects in the West. Further, the framework facilitates identification of intraregional shifts associated with project-induced interregional impacts. Impacts of four water policies were considered. Alternative water policies are: (a) continue present policy, (b) cease new construction and honor existing contracts on present projects, (c) build new water projects but increase water charges on new projects and (d) build new water projects only if they can repay the cost of delivering water for both new and existing projects. Each policy change was evaluated by region with respect to changes in

acreage, total revenue, farm revenue, processing revenue and transportation revenue. Aggregate changes in farm, processing and transportation revenues were also shown. Fall potatoes were used as a vehicle for the analysis. Continuing present water policy would encourage expansion of acreage in areas utilizing subsidized water. Production would remain constant or decline in higher cost production areas. Continuing present pricing policies on existing projects and ceasing construction of new projects implies expanded production would have to be through technical change in water use or through increased acreage in regions not dependent on publicly subsidized water.

EFFECT OF ROW SPACING, SEED RATE, NUTRITION AND IRRIGATION ON ROOT GROWTH, NODULATION, QUALITY AND UPTAKE OF NUTRIENTS IN PEA (PISUM SATIVUM L. VAR. ARVENSE POIR.),
Irrigation Research Centre, Sambalpur (India).
D. Lenka, and O. P. Gautam.
Indian J Agric Sci. Vol 42, No 8, p 676-680, 1972.
Identifiers: *Fertilizers, *Growth rate, Irrigation, *Nitrogen, Nutrients, Nutrition, *Peas, Pisum-sativum-var-arvense, Root zone, Seed, Absorption.

The length and weight of pea were not significantly influenced by the seed rate, row spacing and low dose of starter N. Application of starter N to the soils low in available N increased nodulation, but application to soils high in available N decreased it. Phosphate application and irrigation at both pre-flowering and flowering stages increased root growth and nodulation.--Copyright 1973, Biological Abstracts, Inc.

CHARACTERISTICS OF WATER REGIME OF MALE AND FEMALE DIOECIOUS PLANTS AS A SIGN OF ADAPTATION TO A POOR WATER SUPPLY, (IN RUSSIAN),
M. V. Sivtsev, and S. S. Sizov.
Biol Nauki 15(10): 78-82. Illus, 1972.
Identifiers: Adaptation, Asparagus, *Dioecious plants, Hemp, Lombardy poplar, Mulberry, Box elder, *Leaves.

The water regime of female leaves of diclinous plants (hemp.) spinach, sorrel, willow, asparagus, box elder, Lombardy poplar, mulberry) is more labile than male leaves. Female plants in comparison to male ones have a wider range of changeability which results in a higher degree of adjustment to the fluctuation of the water available to the plants. However, in an acute water shortage, the female plants exhibit less resistance than male leaves.--Copyright 1974, Biological Abstracts, Inc.

SOME EVIDENCE OF ECONOMICS OF SCALE IN HAWAIIAN SUGAR PLANTATION,
Hawaii Univ., Honolulu. Water Resources Research Center.
J. E. T. Moncur.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 903, $3.25 in paper copy, $2.25 in microfiche. Technical Memorandum Report No 38, January 1974. 45 p, 17 fig, 3 tab, 18 ref. OWRT A-026-HI(1). 14-31-0001-3211.

Descriptors: *Sugar crops, Economics, *Hawaii, *Economies of scale, *Economic efficiency, Regression analysis, Water utilization, Withdrawal.
Identifiers: *Farrell's method, Unit isoquants, Oahu(HI).

Of the major sectors in Oahu's economy, sugar growing and milling together use by far the largest quantities of water. The three plantations still operating on Oahu in 1971 accounted for 57 percent of total withdrawals, even though this percentage has steadily declined over the past decade or longer. A persistent trend among plantations, moreover, is for mergers to occur, presumably to take advantage of economics of scale. The effect of scale on sugar production was evaluated. Data for plantations on four of the Hawaiian Islands is applied in several procedures for estimating scale economics and economic efficiency. First, a 'survivorship' test is used. Then the efficiency measures developed by M. J. Farrell are calculated. Finally, some regression estimates are determined.

SUBSURFACE IRRIGATION WITH HEATED WATER, ITS MANAGEMENT AND APPLICATION TOWARD REDUCTION OF THERMAL POLLUTION PROBLEMS,
Minnesota Univ., Minneapolis. Dept. of Agricultural Economics.
E. R. Allred.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 036, $3.00 in paper copy, $2.25 in microfiche. Water Resources Research Center, Univ. of Minnesota, St. Paul, Mimeographed Report, June 1974. 20 p, 13 fig, 1 tab, 3 ref. OWRT B-057-Minn(1). 14-31-0001-3602.

Descriptors: Irrigation, Soils, Crops, *Minnesota, Thermal pollution, *Heated water, *Subsurface irrigation, Potatoes.
Identifiers: *Waste heat energy, *Soil-warming.

The purpose was to evaluate the use of waste heat energy for the growing of agricultural crops in northern climates, to determine the basic heat transmissibility characteristics of soil, and to evaluate crop frost protection benefits as the result of the soil warming process. The layout and the procedures described are based on field studies on a Hubbard loamy sand located at the Sand Plains Experimental Irrigation Field, near Elk River, Minnesota. The following conclusions can be made for the data obtained: Soil warming is necessary for extension of the growing season for field crops in Minnesota. Soil-warming cannot be done effectively by using an irrigation system alone. Artificial warming of a field soil by utilization of waste heat energy does not provide a significant protection for potatoes against frost at temperatures below 28 deg. F. Maturity date for early potato varieties grown in heated soil can be advanced between two and three weeks, as compared to potatoes grown in unheated field soils. Only small quantities of waste heat energy can be utilized by a field soil in Minnesota during July and August. Moderate second crop yields are possible with heated soils in Minnesota, if replanting is done immediately following the first crop harvest. Because of unreasonably low air temperatures encountered in 1974, the early potato harvest date was not advanced appreciably over 1973, even though frost protection measures were installed. (Walton-Minnesota)

LARGE SPRINGS IN THE BLACK HILLS, SOUTH DAKOTA AND WYOMING,
South Dakota School of Mines and Technology, Rapid City. Dept. of Geological Engineering.
P. H. Rahn, and J. P. Gries.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 066, $3.25 paper copy, $2.25 in microfiche. South Dakota Water Resources Institute, Brookings, Completion Report, February 1973, 24 p, 36 ref. OWRR A-021-SDAK(2).

Descriptors: *Groundwater movements, *Springs, Streamflow, *Recharge, *South Dakota, *Wyoming, Water loss, *Groundwater recharge.
Identifiers: *Black Hills Area(So Dak).

Between 1966 and 1971, monthly stream gagings were conducted on most large streams and springs in the Black Hills of South Dakota and Wyoming. Streams draining the impermeable Precambrian core of the Hills lose an average of 40.5 cfs to sinkholes where streams cross the Paleozoic limestone belt flanking the Precambrian core. At the outer edge of the limestone large springs occur where the Triassic Spearfish acts as an impermeable dam to groundwater. The average of these springs is at least 189.4 cfs. The difference between the stream flow loss and the spring discharge is due to precipitation recharge falling directly on the limestone. Since there is probably little deep groundwater loss from this system, precipitation recharge and evapotranspiration rates on the limestone can be established. In general the

northern Hills has a precipitation recharge of at least 6.8 inches/year and the southern Hills at least 0.6 inches/year. Groundwater flow directions, based on dye tests, piezometric levels and discharge measurements show a generally southerly flow of ground water in the eastern flank of the limestone from the Rapid City area toward Hot Springs. (Wiersma-South Dakota)

OPERATIONAL EVALUATION OF IRRIGATION SYSTEMS,
South Dakota State Univ., Brookings. Water Resources Inst.
D. D. Brosz.
Available from National Technical Information Service, Springfield, Va 22161 as PB-236 042, $3.25 in paper copy, $2.25 in microfiche. Completion Report, June 1974. 22 p, 12 fig, 7 tab, 4 ref. OWRT A-030-SDAK(1).

Descriptors: Sprinkler irrigation, Subsurface irrigation, Trickle irrigation, Irrigation operation, Water requirements, Scheduling, Timing, *Irrigation design, Evaluation, *Irrigation systems, Corn(Field), Potatoes, *South Dakota, *Crop response, *Crop production.

Three years' data were collected on yield responses of potato and corn crops irrigated by trickle, subsurface, and sprinkler irrigation systems. The field plots study included six irrigation system design treatments including every row and every other row trickle and subsurface irrigation; small frequent sprinkler application and larger infrequent sprinkler application. Potato and corn production can be increased by 5 to 15 percent with 20 percent less water when it is applied through the use of trickle and subsurface irrigation rather than through sprinklers. A water savings of approximately 30 to 40 percent can be achieved with trickle and subsurface irrigation for yields that are comparable to those obtained with sprinklers. Tensiometers installed in the plots did show that the soil water tension was higher for the trickle and subsurface plots. The irrigation system design treatments had no effect on potato crop maturity or quality; however, the corn grain quality for the sprinkler system applying small frequent irrigations was adversely affected because of black masses of spores (smut) appearing on the ears. (Wiersma-South Dakota State)

FORCED CULTIVATION OF LAMINARIA,
Hokkaido Regional Fisheries Research Lab., Yoichi (Japan).
Y. Hasegawa.
Bull Hokkaido Reg Fish Res Lab. 37 p 49-52, 1971.
Identifiers: *Cultivation, *Japan, *Laminaria, Temperature, *Plant growth, Plant reproduction.

Laminaria of good quality are usually 2-yr-old plants, those that go through 2 winters. A technique was developed for raising food quality plants in 1 yr. Good quality juvenile plants are produced 2-3 mo. ahead of natural germination time, and cultivation starts when water temperature is below 18C. Blades (10-15) of Laminaria are grown per meter of rope. The culture methods and the growth and reproduction of the plants are described.--Copyright 1974, Biological Abstracts, Inc.

YUMA IRRIGATION PROJECT--NOTICE OF OPERATION AND MAINTENANCE CHARGES.
Federal Register, Vol 37, No 240, p 26536-26537, December 13, 1972.

Descriptors: *Administrative agencies, *Regulation, *Irrigation, Operation and maintenance, *Maintenance costs, *Use rates, Water users, Water supply, Irrigation efficiency, Land reclamation, Water allocation(Policy), *California, *Arizona, Federal government, Water requirements, Water delivery, Agriculture, Irrigation water, Water management(Applied), Water contracts, Irrigation permits, Operating costs.
Identifiers: *Administrative regulations.

Public notice is given of annual operation and maintenance charges and annual water rental charges, by the Department of the Interior, for the Yuma Irrigation Project in Arizona and California. The minimum operation and maintenance charge is $15.75 per irrigable acre. The water user is entitled to eight acre-feet of water per acre and payment is made whether or not the water is used. Up to five acre-feet is available on non-sandy land. Additional water, if available, will be furnished at $4.00 per acre-foot payable in advance. Credit for unused additional water will be given towards the succeeding years minimum charges. On written request and approval, water will be furnished to a water user free for reclaiming lands by the usual methods. Lands for which free water was served during the preceeding year will not get any more free water, unless in the opinion of the Project Manager, the results in the preceding year were unsatisfactory. All charges for water are payable in advance. If a water user fails to comply with any regulations, or if he does not pay bills or expenses of extra maintenance caused by faulty irrigation practices, the right to withhold delivery of maintenance caused by faulty irrigation practices, the right to withhold delivery of water is reserved. Late payments are penalized at .5% per month on the unpaid balance. (Sperling-Florida)

IRRIGATION AS A PRACTICAL MEANS TO CONTROL POTATO COMMON SCAB (STREPTOMYCES SCABIES): FINAL EXPERIMENT AND CONCLUSIONS,
Rothamsted Experimental Station, Harpended (England).
D. H. Lapwood, L. W. Wellings, and J. H. Hawkins.
Plant Pathol. Vol 22, No 1, p 35-41. 1973. Illus.

Descriptors: *Patotoes, Irrigation effects, Control, Infection, Diseases.
Identifiers: Benomyl, Oxycarbon, Scab, Streptomyces-scabies.

In 1971, irrigation had little no effect on yields but, when applied early in the season, greatly decreased common scab on the susceptible cultivars 'King Edward,' 'Majestic' and 'Desiree'. 'Record,' and especially 'Pentland Crown,' had little scab with or without irrigation. Most scab infection occurred during dry weather in late June and early July. Irrigation for 6 wk from 4 June, at 0.6 in. (15 mm) soil moisture deficit (SMD) controlled scab most effectively, but 6 wk was only marginally better than 4 wk. With other regimes, the severity of scab increased as the SMD allowed irrigation was increased. 'King Edward' tubers from unirrigated plots were blemished more in 1971 than in the 2 previous dry seasons, partly because rain caused tubers to swell more than previously and enlarged scab lesions to much that healthy tissue between scabs was ruptured. More tubers per plant were formed from 'King Edward' when seed tubers were treated with benomyl and oxycarboxin before planting than when untreated, but irrigation even from 75% emergence had no effect on tuber numbers.--Copyright 1973, Biological Abstracts, Inc.

EVALUATING CLIMATIC LIMITATIONS FOR A SPECIFIC AGRICULTURAL ENTERPRISE,
National Oceanic and Atmospheric Administration, Washington, D.C. Environmental Data Service.
Y. M. Yao.
Agric Meteorol., Vol 12, No 1, p 65-73, 1973.
Identifiers: Agricultural, *Climatic conditions, Dry, Enterprise, Evaluation, *Irrigation, Moisture, *Peanuts, Soils, *Tanzania, Africa.

The East Africa Goundnut (Peanut) Scheme of the late 1940's cited as an example of a costly miscalculation of land use that might have been prevented by climatic assessment. At the site of this scheme, in what is now central Tanzania, water is the most restrictive factor determining natural environment. Adequate soil moisture, both near the surface and in the deeper root zone, is essential for groundnut production. Soil moisture data derived for Dodoma for 30 yr show that in the period mid-Jan.-mid-April the probability that the topsoil will remain dry for at least 16 consecutive days is 57%, and drops only to 37% for 21 or more consecutive days - even though this is the 'rainy season'. The analysis further indicates that the elimination of the most serious periods of moisture shortage would require irrigation, at least once a year, in about 75% of the years. Moisture supplies are optimum for Dec.-April in only about 3% of the yr in both Dodoma and Kongwa. For comparison, the same type of climatological analysis for Tifton, Georgia and Norfolk, Virginia in the major peanut producing areas of the eastern coastal plains region of the USA, indicates that 30 yr produced no occurrences of dry topsoil for as long as 16 consecutive days. Also, the climate there is so suitable for growing peanuts that irrigation in only 10% of the yr would practically eliminate all except the minor periods of water shortage hazard. The condition in Tifton is slightly less favorable than in Norfolk. However, even there, optimum moisture conditions were not high during the critical months.--Copyright 1974, Biological Abstracts, Inc.

ESTABLISHMENT OF GREEN PANIC AS INFLUENCED BY TYPE, AMOUNT AND PLACEMENT OF VEGETATIVE MULCH,
Western Australia Univ., Nedlands. Dept. of Agronomy.
K. G. Rickert.
Aust J Exp Agric Anim Husb., Vol 13, No 62, p 268-274, 1973.
Identifiers: Density, Dolichos-lablab, Emergence, *Green panic, *Mulch, Panicum-maximum-var-trichoglume, Sawdust, Seedling, Sorghum, Stubble, Vegetative mulch.

Establishment of green panic (Panicum maximum var. trichoglume cv. 'Petrie'), was measured after sowing beneath mulches of sawdust, native pasture hay, barley straw, Dolichos lablab stubble

and sorghum stubble. Long, chaffed, or milled materials, all applied at 2500, 5000, or 10,000 kg/ha were tested. Comparisons were made with a control (no mulch) in 2 experiments on a self-mulching clay at Gayndah, south-eastern Queensland (Australia). Seedling emergence with all surface mulches was superior to the control and to emergence from sowing into mulch incorporated in the surface soil. Optimum rates of mulch for emergence approached 5000 kg/ha but varied between experiments and with mulch types. Reducing mulch particle size did not consistently improve emergence relative to long straw. In a 3rd experiment, seedling emergence at 42 days after irrigation was directly related to the proportion of area covered by mulch irrespective of the arrangement of mulch bands. Seedling yield followed trends in plant density. Practical implications of the results are discussed.--Copyright 1974, Biological Abstracts, Inc

EFFECT OF SOIL WATER POTENTIAL ON GROWTH AND YIELD OF SUNFLOWER (HELIANTHUS ANNUUS),
Pahlavi Univ., Shiraz (Iran). Dept. of Irrigation.
N. Sionit, S. R. Ghorashy, and M. Kheradnam.
J Agric Sci. Vol 81, No 1, p 113-116. 1973. Illus.
Identifiers: Growth rates, Helianthus annuus, *Sunflower, *Soil water.

The effect of soil water potential of the root media on the vegetative growth, seed and oil yield of sunflower (cv. 'Record') grown in containers under field conditions was investigated. The weight of shoots and the total leaf area of plants before flowering significantly decreased with decrease in the water potential of the root media. There was a sharp reduction of shoot weight as the potential decreased from -0.32 to -1.25 bars and then a further slow decline as soil water potential dropped to -8.6 bars. There were no significant differences in the 100-seed weights and percentage of oil among the treatments, but the total number of seeds was significantly different. The data did not indicate the existence of a threshold water potential above which yield was independent of soil water potential, but rather that yield was a continuously decreasing function of soil water potential.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF THE RATIO BETWEEN MATRIC AND OSMOTIC SUCTIONS ON THE OAT AND FIRST-YEAR ALFALFA YIELDS, (IN RUMANIAN),
Institutul de Studii si Cercetari Pedologie, Bucharest (Rumania).
A. Maianu, I. Axenova, I. Albescu, and A. Maniu.
An Inst Stud Cercet Pedol. 39, p 39-48. 1971. English summary.
Identifiers: *Alfalfa, *Soil moisture, *Oats, *Osmotic pressure.

The influence of soil total suction, resulting from matric and osmotic suction, on growth and yields of alfalfa and oats was studied. Plants were cropped on 3 soils of different texture types: coarse, medium and fine. Good oat and alfalfa yields can be obtained on non-saline soils if soil moisture does not decrease under 50% of soil available water and under soil equivalent moisture, respectively. The increase of osmotic solution suction at these soil moisture levels greatly decreases the yields. Increase of soil moisture up to the value of field water capacity decreases the negative effect of salts. Minimum oat and alfalfa yields were obtained on sandy soils at all values of total suction, independently of the ratio between matric and osmotic suction.--Copyright 1974, Biological Abstracts, Inc.
W74-12715

EFFECT OF CORN STOVER ON PHOSPHORUS IN RUN-OFF FROM NONTILLED SOIL,
Guelph Univ. (Ontario). Dept. of Land Resource Science.
J. W. Ketcheson, and J. J. Onderdonk.
Agron J. Vol 65, No 1, p 69-71, 1973.

Descriptors: *Corn(Field), *Runoff, *Mulching, Fe.tilizers, Phosphates, Erosion control, Soil stabilization, Cultivation, Soil management, Phosphorus.
Identifiers: *Stover.

The effect of stover on soil and P removal was determined for a well-drained till soil (Guelph loam) with 7% slope. Corn (Zea mays L.) was planted without tillage after 32P-tagged P fertilizer was applied broadcast and covered with a corn stover mulch in 1 treatment or left bare in a 2nd treatment. Run-off was collected and analyzed from 1 simulated and from 2 natural rainfall events. Stover reduced soil P in run-off by 65% and fertilizer P by 97%. These reductions were achieved by a decrease in total run-off and by a decrease in the concentration of suspended soil in it. Of the 29 kg of fertilizer P applied per ha, 3.85 kg (13%) and 0.13 kg (less than 1%) were removed over all run-off events from the no stover and stover treatments, respectively. This corresponded to 8.5 and 1.3%, respectively, of the total P removal, which varied from 45 kg/ha without stover to 10 kg/ha with stover. The liquid fraction of the run-off carried the least amounts of either soil or fertilizer P. Proportionately more fertilizer P was found in the coarse (greater than 50 micro) soil than in the fine fraction (less than 50 micro), whereas proportionately more soil P was found in the latter than in the former, suggesting that fertilizer P is preferentially associated with the coarse fraction.--Copyright 1973, Biological Abstracts, Inc.

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

SURFACE-WATER INVESTIGATIONS ON THE LUMMI INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, Wash.
G. G. Parker, Jr.
Open-file report, 1974. 69 p, 21 fig, 7 tab, 14 ref, append.

Descriptors: *Surface waters, *Aquiculture, *Estuaries, *Indian reservations, *Washington, Sea water, Water quality, Water circulation, Rivers, Dye releases, Dispersion, Path of pollutants, Fish hatcheries, Water pollution effects.
Identifiers: *Lummi Indian Reservation(Wash).

Surface waters were investigated on the Lummi Indian Reservation, Washington. The investigation was oriented to potential water-related problems which could affect the success of the Lummi Indians' aquaculture program. Included were studies of (1) the Skookum Creek hatchery, which hatches and raises fish for the Indians, (2) the Kwina Slough fish pens, which use water from the slough and Nooksack River, (3) traveltimes and rates of dispersion of water in the Nooksack River and the slough relative to possible effects of pollutants from upstream areas, and (4) the aquaculture pond and adjacent marine waters, to determine volume of the pond and the patterns of water movement within, and to and from, the pond. Water discharge in Kwina Slough ranged from zero to more than 1,300 cubic feet per second, and, between high tides during low-flow periods, there is not sufficient channel storage to provide continuously flowing water through the fish pens. Thus, year-round operation of the fish pens in Kwina Slough is not feasible and the fish must be removed prior to the low-flow period. The aquaculture pond on Lummi Bay has a maximum volume of over 80 million cubic feet of sea water. Dye studies in the pond indicate that the primary control of the movement of water entering the pond is the volume of the inflowing water, which is controlled by the tide height and condition of tide gates. Most of the water that enters the pond inlet gates originates in Hale Passage. Samples of the inflowing water contained very little sediment, and deposition is negligible. The sanitary quality of the marine waters is good. (Knapp-USGS)

PREDICTING DEPTH-DISCHARGE RELATIONSHIPS FOR SAND-BED RIVERS,
Manitoba Univ., Winnipeg. Dept. of Civil Engineering.
V. J. Galay, and J. M. Cheung.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 129-143. 6 fig, 2 tab, 25 ref.

Descriptors: *Stage-discharge relations, *Alluvial channels, Sands, Regime, Dunes, Discharge(Water), Hydraulics, Flow measurement, *Discharge measurement, Stream gages, Water measurement.
Identifiers: *Sand-bed rivers.

The many methods available for the prediction of depth-discharge relationships for natural sand-bed rivers are reviewed. These methods are based on a variety of basic assumptions as well as a wide range of data. Application of these methods to several types of rivers indicates that some of them are unreliable. Data from several sand-bed rivers was re-analyzed and a method based on adjustment of the flow depth was developed. This method yields reliable depth-discharge relationships for sand-bed rivers in the low flow regime (dunes). (See also W74-12087) (Knapp-USGS)

In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 11-27, September 1973.

Descriptors: *Management, *Reviews, Computers, *Water supply development, *Industries, Computer programs, Economics.
Identifiers: Regional Water Authorities(Eng), Costing, Statistical reports, Information.

Presented is a review of the current use of computers in providing management information in the water supply industry. First, the present situation in the industry as a whole is considered. Reported are the findings of a Sub-Committee on the use of computers in the Water Industry, set up in July of 1966. Second, some practical problems encountered in the provision of management information in the medium-sized Sunderland and South Shields Water Company (England) are examined. Until fairly recently, the quantity of information such as costing and statistical reports has been too little and its availability has been too late. Work done by the 360/25 computer is discussed; considered are the machine's six suites of programs: (1) water rate accounting; (2) accountancy and costing; (3) payroll; (4) metered supply accounting; (5) stocks and dividends; and (6) engineering and operational. Finally, future prospects for management in the water supply industry are discussed. The industry is being absorbed into a more complex organization, with objectives changing due to a scarcity of national resources. Future demands must be estimated. The new Regional Water Authorities, set up in April 1964, hold responsibility for all the services forming the various parts of the hydrological cycle; the objectives of all these authorities will presumably be the same. This presents a perfect opportunity to install computing facilities on an industry-wide basis. (See also W74-12107) (Bell-Cornell)

AN INTRODUCTION TO COMPUTER INFORMATION SYSTEMS IN DISTRIBUTION,
R. R. Miller.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 265-274, 25-27 September 1973. 3 fig, 9 ref.

Descriptors: Computers, *Water supply, *Networks, *Data collections, Water distribution(Applied), Communication, Management, Planning, Graphical methods, Maps.
Identifiers: *Information collection, Regional Water Authorities(England), Tabular techniques, Cartographic techniques.

Various computer techniques for recording, retrieving and presenting information concerning water supply systems and networks, in both the specific and the broadest sense, are introduced. Tabular and cartographic techniques are dealt with, including the digitization of Ordnance Survey maps. Examples of particular applications already used in urban planning systems, including line printer maps using letter intensity and overprinting, are considered. The paper concludes with a look at other more advanced graphical techniques. Information regarding a distribution system and the other parameters affecting water supply must be easily summarized, digested and up-dated; the first and largest phase of these ventures is information collecting. As this information becomes more generally available, the techniques described and form a basis of systems for its presentation to all interested parties. (See also W74-12107) (Bell-Cornell)

PROPOSED KIELDER WATER RESERVOIR SCHEME COMPUTER APPLICATION IN YIELD ASSESSMENT,
Northumbrian River Authority (England).
U. V. Burston.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 20-25, 25-27 September 1973. 3 fig.

Descriptors: *Computer programs, *Simulation analysis, *Water supply development, *Water demand, *Withdrawal, Water transfer, Reservoirs, Rivers, Design, Operations, Flow, Data collections, Catchments, Systems analysis, Estimating.
Identifiers: *River authorities.

Described is the proposed Kielder Water Scheme designed to meet future major industrial and domestic demands within the three-river Northumbrian River Authority area. The scheme consists of a 44,000 m.g. capacity regulating reservoir, a major river intake and pumping station, and a 25-mile-long aqueduct. The proposed water release and transfer strategy is described briefly. On the basis of a three-year design period and assumed abstraction (withdrawal) conditions, the yield of the scheme was assessed by hand calculating the maximum demands which could be met by the system, including the presently existing reservoir and river abstraction operations. Discussed is a computer program for simulation of the daily operation of the proposed system. In this program, the computer daily examines the natural flow at the abstraction point on the three rivers, based on gaging station records, adjusts this flow for the effect of any reservoirs in the catchment and calculates the gross make-up required (if any) at each abstraction point, using an assumed figure of 15% for operating losses. The study has indicated that the basic Kielder Water Scheme would, on present demand estimates, meet additional demands

within the River Authority's area until the years 2005 and 2003 respectively. (See also W74-12107) (Bell-Cornell)

GENERAL ENGINEERING COMPUTER USE AT THE WELLAND AND NENE RIVER AUTHORITY,
Welland and Nene River Authority (England).
M. V. Gibbons.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 26-29, 25-27 September 1973.

Descriptors: Computers, *River basin commissions, *Water resources, *Design, *Land use, *Drainage, *Computer programs, Hydrometry, Data processing, Environmental engineering, Hydrology, Simulation analysis, Dynamic programming, Reservoirs, Mathematical models, Systems analysis.

In 1969, a computer aided design center was made available to the Authority as a result of work relating to hydrological design of a reservoir. Described briefly is the center's multiple access system and ainteractive computing facilities. Computer work presently being carried out by the Authority is divided into three groups: (1) water resources design; (2) land drainage design; and (3) hydrometric data processing. A brief description is given of some of the main programs under each of the three groupings. Considered in group 1 are the production of synthetic data from short records, the use of digital simulation models, and dynamic programming for producing detailed optimal reservoir control rules. From group 2, the author considers two backwater curve programs based on the standard step method, the plotting of river cross sections, and determination of the capacities of flood storage reservoirs. Mentioned briefly from group 3 are a program developed for use with license classification and analysis, and the design of flat-vee weirs. These descriptions indicate the general use to which the computer is being put in the Engineer's department of a medium sized River Authority. (See also W74-12107) (Bell-Cornell)

THE DESIGN OF A TWO-RESERVOIR RIVER REGULATING SCHEME,
South Staffordshire Waterworks Co. (England).
M. H. Harley, and T. R. E. Chidley.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 30-34, 25-27 Septem 1973. 2 fig, 3 ref.

Descriptors: *Design, *River regulation, *Reservoirs, *Dynamic programming, Stochastic processes, Decision making, Reservoir releases, Flow, Alternative planning, Probability, Computers, Systems analysis, Water demand, Simulation analysis.
Identifiers: *River Dee(North Wales).

Described are the principal findings of a study in which the Dynamic Programming Principle was applied to the design of a river regulation scheme. The problem was to find how much water to release each month from each reservoir to meet the demand for regulation and compensation water. Effectiveness was measured by the sum of the deficits incurred over a long period of time. Different methods of applying the technique of dynamic programming were explored. It was found that stochastic dynamic programming introduced problems of state space; policy iteration and value iteration were considered in terms of efficiency and convergence to the global optimum. For stochastic dynamic programs the policy iteration technique was found to be unsuitable in practice. Deterministic dynamic programming was found to yield near optimal policies for even short flow sequences of 25-50 years. In each case, the policy determined by the dynamic program was simulated on historic and synthetic flow data. This whole process was embedded into a version of the Problem Oriented Language HYDRO developed by the authors. Deterministic dynamic programming was found to be an easy, efficient, and flexible technique for reservoir operations design. Its yielded policies were as good as those developed by weeks of simulation. (See also W74-12107) (Bell-Cornell)

WATER RESOURCE DEVELOPMENT SYSTEM,
Cornwall River Authority, Launcestor (England).
F. L. Oates.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 39-51, 25-27 September 1974. 9 fig.

Descriptors: *Water resources development, *Computer programs, *Water supply, *Regional development, Design, Operations, Management, Reservoirs, Hydrology, Costs, Economics, Decision making, Mathematical models, Systems analysis, Simulation analysis.
Identifiers: Alternative schemes, Comparison, River authorities.

In order to deal with the multiplicity of sources and reservoir sites possible for development, the Cornwall River Authority evolved a computer-based system for the comparison of schemes on a common basis and for the design and operation of integrated regional water supplies. A costing manual was prepared providing unit costs and curves for all elements of water resources development schemes. Standard programs for costing assessment of yield of reservoir schemes were developed. The economics of various patterns of development to meet present and future demands were then compared on a regional basis. From over 70 alternative future reservoir sites, 3 were selected to serve the Authority's area. It was found that considerable savings could be achieved by the complete integration and linking of existing and proposed future water supply systems. Computer programs, simulating the systems through a synthetic drought flow pattern, were used for design purposes. To make accurate evaluation of operating costs and drawdown, the systems had to be simulated through long term flow sequences. This work was found to have obvious applications in the field of operational management. Programs are being developed to devise operating rules and management instructions to minimize operating costs and reservoir drawdowns. (See also W74-12107) (Bell-Cornell)

COMPUTER ORIENTED APPROACH OF A WATER DISTRIBUTION SYSTEM,
National Inst. of Scientific Research, Quebec.
H. Demard, B. Bobee, and J. P. Villeneuve.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 85-88, 25-27 September 1973. 5 ref.

Descriptors: *Water distribution(Applied), *Networks, Computers, *Water demand, *Data processing, Pricing, Water resources, Research, Analysis.
Identifiers: Real-time control.

A prevailing approach to water distribution is one which considers water as a limited resource and aims at influencing the demand, by using such means as pressure variation, drawing up a water rate structure, etc. At INRS-Eau, a research group is studying and achieving the measures which may be used in this approach. Their program consists of comprehensive analysis of the different components of a water distribution network: (1) the demand structure (space-time variations); (2) the network's behavior; (3) the real time control as a result of the two previous steps; and (4) a pricing policy. Achievement of these steps involves data acquisition, processing and analysis, as well as process control and therefore necessitates computer aid. These steps are discussed together with the role played by the computer in accomplishing them. Computers are the major tools for: acquisition of demand data; building up a forecasting model; knowledge of system behavior; and real-time control of the system. (See also W74-12107) (Bell-Cornell)

AN INVESTIGATION OF THE OPTIONAL ON-LINE CONTROL OF A WATER SUPPLY NETWORK,
Cambridge Univ. (England). Engineering Lab.
F. Fallside, and P. F. Perry.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 89-93, 25-27 September 1973. 3 fig, 4 ref.

Descriptors: *Water supply, *Networks, *Operations research, *Simulation analysis, Computers, Operating costs, Reservoirs, Pipes, Optimization, Flow, Mathematical models, Equations, Systems analysis, Linear programming.
Identifiers: *On-line control, *Cost minimization, Production plants, Daily, Non-linear programming.

For distribution systems it is often appropriate to use an optimal control in which control inputs are calculated to minimize a performance index subject to certain constraints imposed by the plant; operating cost is well-defined and can be included in the performance index, leading to least cost operation of the network. The technical problems in implementing such a control are discussed. A collaborative project for introducing an optimal on-line control for a specific water supply network is described. System modeling and formulation of the optimal control problem are discussed. The model chosen for the water system simulates the plant by a series of nodes, each of which has associated with it some or all of the following elements: (1) production plant; (2) reservoirs; (3) pipelines; and (4) boosters. The optimization program finds the optimal flows every 2 hours for meeting the typical daily consumption pattern. It also calculates best flow distribution between source stations for meeting the base of the consumer load and the optimum reservoir levels for meeting the diurnal fluctuation in demand. Calculations were done on an IBM 370/165 computer with relatively little computer time. The ultimate aim for the on-line optimal control of the network is to produce an integrated set of programs covering prediction, analysis and optimization which will operate satisfactorily in an on-line environment. LAY-OUT AND DIAMETER OPTIMIZATION FOR A LOOPED WATER TRANSPORTATION NETWORK,
Municipal Water Works of Rotterdam (Netherlands).
J. Haijkens, and A. Wedemeier.

In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 94-97, 25-27 September 1973. 1 fig, 3 equ.

Descriptors: *Water distribution(Applied), *Networks, *Design, Constraints, *Water supply development, Water demand, Pipe flow, Pressure, Water works, *Optimization, Investment, Costs, Equations, Mathematical models, Systems analysis.
Identifiers: *Pipe diameter, Looped networks, Pipe bursts, Algebraic symbols, Surplus capacity.

Considered is the optimization of water distribution systems. In the case of a looped network, an approximation of an optimum is a difficult iterative procedure, which does not always yield the desired solution. To deal with this problem, the Rotterdam Waterworks is considering the importance of building the requirements for a continuous water supply to customers into a programming model. An objective is to insure that even during pipe burst, sufficient water can be supplied under reasonable pressure to each user. Discussed are the constraints which must be set in designing such a looped network. Demands must be made to the mutual ratio of the diameters of the incoming or outgoing pipes of a junction, and a certain surplus capacity must be introduced into the network. The outgoing pipes--in case of a burst in an incoming pipe--should be considered as potential incoming pipes. Formation of the objective function requires judgement about the pressure drop per unit of pipe length. A simple example illustrates how a relationship can be found between the flow capacity and the investment costs for the laying on of a pipe with a certain diameter. ANALOGUE AND HYBRID METHODS FOR THE ANALYSIS AND PLANNING OF WATER DISTRIBUTION NETWORKS,
Ring-Belt Ltd. (West Germany); and Montan-Forschung (West Germany).
P. Powell, J. Reitz, and P. A. Ziller.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 98-100, 25-27 September 1973.

Descriptors: *Water distribution(Applied), *Networks, *Analog computers, *Analog models, Digital computers, Systems analysis, Planning, Simulation analysis, Pipes, Hazen-Williams equation.
Identifiers: *Hybrid technique.

Described are developments in the use of Analogue computers for the analysis of water distribution networks and the combination of the best of both Analogue and digital techniques in the Hybrid method. In the special purpose, direct Analogue, the flow of current through electronic circuits is used to simulate quantitatively the flow of water through a pipe network. There are three basic types of unit: (1) source units (power supplies); (2) pipe cells (resistance cells); and (3) load cells These units may be connected together to represent a given system by means of a patchboard arrangement. In the Hybrid technique, the digital machine is used where most effective--in handling and presenting all the figures involved in the exercises, e.g., in preparing the data for setting up the Analogue. The digital can cross-check the data and results from the Analogue (and vice versa); moreover, it can check the validity of network simplifications used on the Analogue. Identifiers: *Wabash River(Ind), Reservoir operating policy, Muskingum routing model, Balancing policy, Drainage area ratio policy, Storage volume ratio policy.

A daily simulation model was developed for the Upper Wabash Reservoir River System in Indiana. The motivation for this work was to apply the systems approach to a major river basin with the objective of elucidating water resources planning, management and evaluation questions. The core of this project was a study of reservoir operating rules using a daily quantity simulation model. Three preceding reports outlined the construction of the model and the different operating policies used. This report deals with the documentation of all the quantity simulation programs written to date for the Upper Wabash simulation model. Prior to the documentation effort the Computer programs were written in a more modular form to improve computation efficiency. Computation times were decreased up to 50 percent. An extension to the model, which is not geographic in nature, would be adding a forecast model. This would bring it closer to being a practical tool for reservoir operations. (See also W74-12196)

Identifiers: *San Francisco Bay(Calif).

Four streams in the San Francisco Bay Region were studied from the standpoint of designing flood control systems that would incorporate park and recreational benefits in addition to flood control benefits. Such designs were generally more expensive than alternative single purpose flood controls systems. Institutional obstacles to a multipurpose use of stream areas are described. A planning a agency with a broad responsibility is needed to carry out planning for multipurpose use of urban stream areas. Also a change in federal cost sharing regulations would encourage multipurpose use. (Snyder-California, Davis)

TEMPORAL CHANGES IN BIOMASS, SURFACE AREA AND NET PRODUCTION FOR A PINUS STROBUS L. FOREST,
Forest Service (USDA), Franklin, N.C. Southeastern Forest Experiment Station.
W. T. Swank, and H. T. Schreuder.
In: IUFRO Biomass Studies, International Union of Forest Research Organizations, Working Party on the Mensuration of the Forest Biomass, 1973, Vancouver British Columbia, Canada, University of Maine at Orono, College of Life Sciences and Agriculture, p 171-182. 2 fig, 5 tab, 11 ref.

Descriptors: *Biomass, *White pine trees, *Primary productivity, Evapotranspiration, Vegetation effects.
Identifiers: Plant surface area.

Weighted, linear regression models were used to estimate biomass and surface area of foliage, branches, and stems from tree basal area for a planted white pine stand on a 16.1 hectare watershed. Estimates were made at stand ages 10, 12, and 15 years. During the 5-year period, the stand closure changed from partial to complete and model coefficients showed large changes, particularly for foliage. In February 1972, aboveground biomass for the population was 4,664, 22,825, and 42,110 kilograms per hectare for foliage, branches, and stems. The population of trees contained 9.9, 2.3, and 0.4 hectares of foliage, branches, and stems per hectare of land surface. Net primary production was estimated to be 13,500 kilograms per hectare per year, and foliage development for the pine population culminated when the stand was only 12 years old. Intra- and interspecies comparisons show that data are in the upper range of values reported for forests. Streamflow data for the watershed demonstrate the dynamic nature of changes in stand structure and hydrologic processes.

COMPARISON OF THREE METHODS OF ESTIMATING SURFACE AREA AND BIOMASS FOR A FOREST OF YOUNG EASTERN WHITE PINE,
Forest Service (USDA), Franklin, N.C. Southeastern Forest Experiment Station.

W. T. Swank, and H. T. Schreuder.
Forest Science, Vol 20, No 1, p 91-100, March, 1974. 2 fig, 4 tab, 12 ref.

Descriptors: *Biomass, *White pine trees, *Statistics, Regression analysis.
Identifiers: Plant surface area, Foliar.

This paper presents estimates of foliage, branch and stem surface area, and ovendry weight, with estimates of precision of these statistics, for a 10-year-old stand of eastern white pine on a 16-ha watershed at the Coweeta Hydrologic Laboratory in the southern Appalachians. Three different methods were used to estimate the forest surface area and biomass: (1) stratified two-phase sampling, (2) two-phase sampling with a regression estimator, and (3) two-phase sampling with a ratio-of-means estimator. Stratified two-phase sampling was the most precise and appropriate method; the population was estimated to contain 5.3 ha foliage, 0.76 ha branches, and 0.13 ha stems per hectare of land surface. The estimated ovendry weight of tree components was estimated to be 2.71, 6.83, and 7.01 metric tons per hectare, respectively, for foliage, branches, and stems. The standard error of estimate for surface area and biomass ranged from 5 to 10 percent, depending upon the tree components of interest.

Identifiers: Channel capacity adjustment, River Tone(Somerset-United Kingdom), Clatworthy reservoir.

The construction of a reservoir may provide an opportunity to identify the way in which a changed pattern of river discharge below a dam results in an adjusted channel capacity. This was tested in the basin of the River Tone, Somerset, by comparing channel capacity above and below the Clatworthy reservoir, constructed in 1959. At a number of sites below the dam the channel cross section is multiple in form, the upper element represents the bank-full stage prior to dam construction, and the lower element is the contemporary bank-full level. The reduction of channel capacity downstream from the reservoir persists for a distance of 11 km until the catchment area contributing to the river is at least four times that draining to the reservoir. Peak discharge below the dam is deduced to be approximately 40% of the value that obtained prior to reservoir construction. (Dawes-ISWS)

FLOOD PLAIN INFORMATION: KINGSLAND CREEK, CHESTERFIELD COUNTY, VIRGINIA,
Army Engineer District, Norfolk, Va.
Prepared for Chesterfield County, Virginia, April, 1974. 23 p, 7 fig, 6 tab, 11 plates.

Descriptors: *Flood plains, *Flood forecasting, *Flood profiles, Obstruction to flow, Flood data, Land use, Floodproofing, Flood stages, Flood discharge, Planning, Hurricanes, Urbanization, Flood damage, *Virginia.
Identifiers: *Kingsland Creek(Virginia), *Chesterfield County(Virginia), Richmond(Va), James River(Va), Falling Creek(Va), Swift Creek(Va), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

The relatively undeveloped and wooded flood plain adjacent to Kingsland Creek is ideal for industrial development as it is only 2 miles south of Richmond and just west of the James River. Gage readings from nearby Falling and Swift Creeks which have similar flood characteristics are used for flood information. Floods caused by heavy rainfalls which are intensified by thunderstorms and hurricanes in summer and fall can be expected in all seasons. Flood flows reach high velocities due to the steep stream gradient caused by the 'fall line' of the Coastal Plain and the Piedmont Plateau. Bridges, culverts, overhanging vegetation, and timber piles on the flood plain create obstructions to flood flow. A sewage disposal pond poses a potential health hazard. The record flood for Falling and Swift Creeks occurred July 18, 1945 and the most recent major flood occurred June 22, 1972. Discharge for an Intermediate Regional Flood (IRF) on the Kingswood would range from 7200 cfs at the mouth to 2090 cfs at the upper reach of the study area at Virginia Route 10; velocity in the main channel would average 3 to 5 ft. per second, with the height of rise at 8.5 ft. In a Standard Project Flood (SPF), the expected range of discharge is 12,590 to 2,910 ft., the average velocity 4 to 6 feet per second, and the height of rise 8.5 ft. Such floods would inundate residential and commercial properties, most significantly damaging the area near U.S. 1-301. Adoption of land use controls to guide flood plain development can be based on the data presented. (Diefendorf-North Carolina)
W74-12393

FLOOD PLAIN INFORMATION: OLDTOWN CREEK AND TRIBUTARY, CHESTERFIELD COUNTY, VIRGINIA,
Army Engineers District, Norfolk, Va.
Prepared for Chesterfield County, Virginia; March, 1974. 21 p, 7 fig, 4 tab, 11 plates.

Descriptors: *Flood plains, *Flood forecasting, *Obstruction to flow, Flood profiles, Flood data, Flood stages, Flood discharge, Flood proofing, Land use, Planning, Hurricanes, Urbanization, Flood damage, *Virginia.
Identifiers: *Oldtown Creek(Virginia), *Chesterfield County(Virginia), Seaboard Coast Line Railroad, Appomattox River(Va), Richmond(Va), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

Data presented may provide a basis for the adoption of a flood plain ordinance and other regulations which can be used to prevent an increase in damages and further unregulated development in the narrow watershed where residential, municipal and commercial development already exist. Increasing urbanization of the Richmond area will create pressure for use of the Oldtown Creek flood plain. Oldtown Creek with a drainage area of about 14 square miles flows through the southern portion of Chesterfield County and through the city of Colonial Heights to its confluence with the Appomattox River. Floods caused by rain can be expected in all seasons, with larger floods caused by thunderstorms and hurricanes more likely in summer and fall. Obstructions to flow are created by 14 bridges and the limited capacity of the culvert at Seaboard Coast Line Railroad. Gaging records and newspaper files from streams in the general area indicate that flood stages rise quickly and that flow moves at high velocity. The largest flood in the area occurred in July 1945, the most recent in June 1972. Discharge can be expected to range from 6770 cfs at the mouth to 2100 cfs at the upper limit of the study area in an Intermediate Regional Flood (IRF) and from 12,160 cfs to 2700 cfs in a Standard Project Flood (SPF). Average velocity in the main channel in an IRF would be 2 to 6 ft. per second and 4 to 10 ft. per second in a SPF. Substantial damage to residential property, streets, roads and utilities may be expected from either an IRF or SPF as no flood control structures or flood plain regulations presently exist. (Diefendorf-North Carolina)

FLOOD PLAIN INFORMATION: MAUMEE AND AUGLAIZE RIVERS, DEFIANCE, OHIO,
Army Engineers District, Detroit, Mich.
Prepared for the Division of Water of the Ohio Department of Natural Resources, and the Maumee Watershed Conservancy District; 1970, 65 p, 6 fig, 16 tab, 16 plates.

Descriptors: *Flood forecasting, *Flood stages, Flood data, Flood plains, Flood profiles, Flood discharge, Land use, Obstruction of flood flow, Planning, *Ohio.

Identifiers: *Maumee River(Ohio), *Auglaize River(Ohio), *Defiance(Ohio), Defiance County(Ohio), Flood plain management, Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

The principal commercial district and a large residential section of Defiance, built in the area between the Maumee and Auglaize Rivers, have been inudated in the past and would be affected by future Standard Project Floods (SPF) and Intermediate Regional Floods (IRF) on both rivers. Major floods usually caused by heavy rainfall occur from October to May, with the greatest incidence in February and March. Four bridges on the Maumee and 5 bridges on the Auglaize create obstructions to flood flow. Several islands may also collect ice and debris as additional obstructions. The greatest flood occurred in March 1913, with flood discharge approximately 60% greater than the next known discharge. The most recent major flood when water was not affected by river ice was February 16, 1950 with a gage reading of 13.70 ft. on the Maumee and 26.40 ft. on the Auglaize. The Maumee may be expected to rise 5.5 to 6.0 ft. higher in an Intermediate Regional Flood (IRF) and 18.0 to 21.0 ft. higher in a Standard in an Intermediate Regional Flood (IRF) and 18.0 to 21.0 ft. higher in a Standard Project Flood (SPF), the Auglaize 5 to 6 ft. in an IRF and 19.0 to 23.0 ft. in a SPF. The impact of either an IRF or a SPF would be devasting, creating a hazardous situation in developed areas. (Diefendorf-North Carolina)

BIOLOGICAL CONTROL OF WATER HYACINTH WITH INSECT ENEMIES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
E. O. Gangstad.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-775 408; $5.00 in paper copy, $2.25 in microfiche. Aquatic Plant Control Program Technical Report 6, January 1974. 152 p, 3 fig, 2 tab, 125 ref.

Descriptors: *Biocontrol, *Water hyacinth, *Insects, Aquatic weed control, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Arkansas, Texas, Alligatorweed, Snails, Mites, Environmental effects, Chemcontrol.
Identifiers: Utilization, Flies, Grasshoppers, Moths, Weevils, Manatees, Thrips, Flea beetles.

Because there is little possibility of eradicating the water hyacinth solely by chemical or mechanical methods in many areas of the South Atlantic and Gulf Coast states, various biological control agents are under investigation in cooperation with the USDA Entomology Division and the Corps of Engineers in the United States, Argentina, Uruguay, Trinidad, India, British Guiana, British Honduras and Guatemala. There are indications that real possibilities exist for biocontrol of water hyacinth and investigations are continuing to define the potentiality of various species of flies, caterpillars, weevils, flea beetles, thrips, moths, grasshoppers, and their host specificity. The potential environmental effects of releasing insect importations are discussed. (Auen-Wisconsin)

BEECH CREEK, MT. VERNON, OREGON, FLOOD CONTROL CHANNEL (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Walla Walla, Wash.
Available from National Technical Information Service, Springfield, Va 22161 as EIS-OR-73-1547-F. September 26, 1973. 47 p, 9 fig.

Descriptors: *Environmental effects, *Watershed Protection + Flood Prevention Act, *Flood protection, *Channel improvement, *Flood routing, *Oregon, Channels, Water management(Applied), Drainage, Drainage practices, Floods, Economic effects, Federal government, Flood plain zoning, Watershed management, Wildlife habitat, Rivers, Flood damage, Flood control, Runoff, Quarries, Rock excavation, Fish migration, Administrative agencies.
Identifiers: *Environmental Impact Statements, National Environmental Policy Act, *Mt. Vernon(Ore).

The project proposal involves flood channel construction on Beech Creek for the protection of the city of Mt. Vernon, Oregon, and flood plain zoning in unprotected areas upstream and downstream from the city. Serious flooding has occurred during the winter months causing costly damage to the residential and commercial areas through which Beech Creek flows. Besides providing flood protection the work would modify the appearance of the existing channel and will require provision of a fish-way to accommodate the annual fish migration. The displacement of existing streambank vegetation and wildlife, the need for a rock quarry and the temporary disturbances in the community during construction activity constitute the adverse effects of the project. The alternatives include an upstream storage project, flood plain zoning alone or no action. These were not feasible because of their expense or inefficiency. The rock quarry site, materials, labor, and four acres of land suitable for homesites would be irreversibly committed. Comments were received from local, county, state and federal interest groups. (Dillingham-Florida)

BAKER LAKE WATERSHED PROJECT, FALLON COUNTY, MONTANA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Soil Conservation Service, Bozeman, Mont.
Available from the National Technical Information Service, Springfield, Va. 22161 as EIS-MT-73-1327-F. August 13, 1973. 50 p, 1 tab, 3 map.

Descriptors: *Environmental effects, *Dam construction, *Montana, *Federal government, Land management, Water management(Applied), Dams, Watersheds(Basins), Flooding, Flood control, Sediment control, Erosion control, Watershed management, Runoff, Soil conservation, Water resources development, Rocky Mountain region.
Identifiers: *Environmental Impact Statements, *Administrative regulation, *Baker Lake, Mont.

This project involves construction of a single-purpose floodwater retarding structure and land conservation treatment measures. It is designed to protect the city of Baker and Baker Lake, in southeastern Montana, from floodwater and sediment damage. The region is semiarid and is used primarily for rangeland and oil wells. The watershed includes most of the city. The project will reduce floodwater and sediment damage, enhance opportunities for future reclamation of Baker Lake, reduce sediment production and runoff from the watershed. Some plant species and wildlife habitat will be lost, and the potential hazard of soil waste pollution in the basin will be increased. Alternatives considered were: land treatment along, alternative structural measures, floodproofing, channeling and diking, land use regulation, flood plain insurance, and no project action. Land use patterns are stable and expected to remain unchanged. 185 acres, mostly rangeland, will be irrevokably committed to project use. The public and other governmental agencies generally support the project. (Deckert-Florida)

SOWASHEE CREEK WATERSHED, LAUDERDALE COUNTY, MISSISSIPPI (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Soil Conservation Service, Washington, D.C.
Available from NTIS, Springfield, Va. 22161 as EIS-MS-73-1716-F. October 29, 1973. 84 p, 1 tab, 2 map.

Descriptors: *Environmental effects, *Multi-purpose projects, *Federal government, *Mississippi, Water management(Applied), Land management, Dams, Watersheds(Basins), Dam construction, Flooding, Flood control, Sediment control, Channel improvement, Erosion control, Watershed management, Gulf coastal plain, Recreation facilities, Recreation, Reservoir construction, Reservoirs.
Identifiers: *Environmental impact statement, *Administrative regulations, *Meridan, Miss.

This project is to solve problems of erosion, sedimentation, flooding, and inadequate recreational facilities in the Sowashee Creek Watershed. The city of Meridian, Mississippi is particularly affected by this project. The plans call for conservation land treatment measures, single-purpose floodwater retarding structures, a multi-purpose structure for floodwater retardation, channel modifications, and basic recreation facilities. Sheet erosion occurs on most of the land in the watershed. Damaging flooding occurs as often as four times per year in some of the low-lying areas. The project will reduce flooding, erosion, and sediment deposition and will create fishery and waterfowl habitat. The proposed project is the most feasible of the various combinations of the plan's components that were considered. The effects upon long-term use of resources is minimal. While some concern is expressed by various agencies respecting the channel modification called for in the plan, reaction to the program is generally favorable. (Deckert-Florida)

REPORT OF THE RIVER MASTER OF THE DELAWARE RIVER FOR THE PERIOD DECEMBER 1, 1972 - NOVEMBER 30, 1973.
Office of Delaware River Master, Milford, Pa.
U.S. Geological Survey Report, May 1974. 82 p, 3 fig, 1 plate, 19 tab.

Descriptors: *Delaware River Basin Commission, *Delaware River, *Streamflow, *Water management(Applied), Water quality, Monitoring, River basin development.

The twentieth Annual Report of the River Master of the Delaware River covers the year December 1, 1972 to November 30, 1973. The year was generally above normal from a hydrologic standpoint. Precipitation was excessive. The annual flow of Delaware River at Montague, N. J., adjusted for diversions and changes in reservoir storage was about 40% above median and the third highest of record. Intense, heavy rains caused flash floods on streams tributary to the upper Delaware River June 29 and 30. Storage of reservoirs during the year decreased from 76.0% in December, 1972, and on November 30, 1973, the combined storage was 57.0% of capacity. The maximum combined storage during the year was 104.7% of capacity (June 30). The minimum was 57.0% of capacity (November 30). Diversion by New York City did not exceed the legal limit. Diversions through the Delaware and Raritan Canal in New Jersey did not exceed limits. Data are presented showing the extent of salinity invasion and other water-quality characteristics during the report year. The gaging station at Montague continues participation in the Earth Resources Technology Satellite program by transmitting river stage data. Other sites that have been activated monitor water quality data, groundwater elevations, and stream stages. Data is transmitted from the ERTS-1 satellite to Goddard Space Flight Center, Greenbelt, Md., and by landline to the Pennsylvania District Water Resources Center for processing. (Knapp-USGS)

4B. Groundwater Management

HYDROLOGIC CONSEQUENCES OF USING GROUNDWATER TO MAINTAIN LAKE LEVELS AFFECTED BY WATER WELLS NEAR TAMPA, FLORIDA,
Geological Survey, Tallahassee, Fla.
J. W. Stewart, and G. H. Hughes.
Open-file report 74006, 1974. 67 p, 20 fig, 2 tab, 3 ref.

Descriptors: *Lakes, *Florida, *Surface-groundwater relationships, Withdrawal, Pumping, Infiltration, Water levels, Water level fluctuations, Groundwater movement, Water wells.
Identifiers: *Tampa(Florida).

Extreme declines in lake levels near Tampa, Florida have been forestalled since 1966 at Round Lake and since 1968 at Charles and Saddleback Lakes by pumping water from the Floridan Aquifer into the lakes. Levels are maintained at a nearly constant stage slightly below the altitude at which the lakes begin to overflow and generally above the altitude that the lake levels would have attained naturally. The pumping compensates for the lowering of the water table caused by pumping for public water supply and below-normal rainfall. Combined pumpage into the three lakes averaged 765 gpm during 1971. During 1971, rainfall was about equal to lake evaporation so the water pumped into the lakes was used entirely to replace water that leaked from the lakes into the local aquifer system. Almost all leakage eventually returned to the Floridan Aquifer. The estimated increase in lake evaporation attributable to maintaining the lake levels against the effects of pumping for public water supply and below normal rainfall would have been 25 gpm for the three lakes or 3% of the groundwater input for 1971. Adding groundwater to the lakes caused a distinct change in the chemical quality of the lake water, generally characterized by increases in calcium, bicarbonate, hardness, and alkalinity. However, many lakes in Florida are naturally supplied with the same kind of groundwater; hence, any long-term ecological changes are not expected to be drastic or harmful. Further study will be needed to document whether any long-term ecological changes are likely to occur. (Knapp-USGS)

DEVELOPMENT OF WATER FROM FRACTURED CRYSTALLINE ROCKS, REPUBLIC OF KOREA,
Ministry of Construction, Seoul (Republic of Korea).
J. T. Callahan, and Seung Il Choi.
Reprint of paper presented at the 2nd International Convention on Groundwater (Atti Del 2 Convegno Internazionale Sulle Acque Scotterranee), Palermo, Italy, April 28-May 2, 1973. 20 p, 5 fig, 3 tab, 5 ref.

Descriptors: *Hydrogeology, *Groundwater, *Water resources development, *Fractures(Geologic), Granites, Metamorphic rocks, Water yield, Water wells.
Identifiers: *Korea.

The development of water from crystalline rocks, in the Republic of Korea, has been limited to a relatively few places. Wells were drilled to supplement a few public water supplies in 1960 and 1961 and for the extraction of thermal water at hot springs resorts beginning in the early 1920's. More than 130 water wells were drilled in all types of crystalline rocks from 1966 to 1971. Wells drilled on favorable geologic structures, intersecting joints, fractures, and faults, and solution zones in thin limestone beds have a better change of yielding large volumes of water than those drilled at random sites. The depth of weathering of crystalline rocks and the topographic location appear to influence the sustained yield of wells. Wells in areas of low relief and deep weathering in the western part of the peninsula yield larger volumes of water on a sustained basis than those in the central mountainous areas. Weathering to depths of 25 meters is not uncommon, and weathered zones in granite and schist interbedded with limestone were encountered in wells to depths of more than 60 meters. Based on low-flow measurements of major and minor tributaries in the Han River basin during the dry seasons, individual subbasin groundwater outflow from crystalline rocks ranged from 500 cu m/day to more than 1,000 cu m/day per square kilometer. Streams in basins underlain by granite flowed more consistently than stream underlain by other rock types during periods of drought. The chemical quality of groundwater in crystalline rocks is satisfactory for most purposes. Dissolved solids generally are less than 300 milligrams per liter. (Knapp-USGS)

GROUNDWATER RESOURCES OF THE HOLLYWOOD AREA, FLORIDA,
Geological Survey, Tallahassee, Fla.
H. W. Bearden.
Open-File report FL-74015, 1974. 71 p, 17 fig, 5 tab, 21 ref.

Descriptors: *Groundwater, *Hydrogeology, *Saline water intrusion, *Florida, Water utilization, Withdrawal, Municipal water, Water quality, Water levels, Drawdown, Transmissivity, Water yield.
Identifiers: *Hollywood(Fla).

Freshwater for all purposes in Hollywood, Florida, is derived from the highly permeable Biscayne aquifer. The aquifer is composed chiefly of permeable beds of limestone, sandstone, and sand that extend from land surface to a depth of about 200 feet. Water levels in the aquifer fluctuate chiefly in response to rainfall, the major source of recharge. The water table slopes gently from the west and averages about 1.0 foot higher in the western part of the city than in the eastern part. The configuration of the water table is greatly influenced by Hollywood Canal and the ocean. Because the permeability of the aquifer is high, the effect of pumping of wells is dispersed over a large area and drawdowns are about 0.1 foot. Saltwater intrusion from Hollywood Canal is the chief threat to the groundwater supply in Hollywood. When discharge is low, the chloride concentration of water in the canal has reached levels greater than 10,000 mg/liter. Saltwater has been detected in the aquifer at depth within 0.1 mile of the municipal wells. Groundwater of good quality is available in the western part of the Hollywood area. Because the transmissivity of the Biscayne aquifer is high, with proper planning additional quantities of water can be obtained without affecting water levels significantly in existing wells. GROUNDWATER RESOURCES OF YELLOW CREEK STATE INLAND PORT AREA, TISHOMINGO COUNTY, MISSISSIPPI,
Geological Survey, Jackson, Miss.
E. H. Boswell, and B. E. Wasson.
Yellow Creek State Inland Port Authority, Mississippi, Publication, 1974. 19 p, 1 fig, 1 tab, 9 ref.

Descriptors: *Groundwater, *Water yield, *Mississippi, *Industrial water, Water supply, Aquifers, Water resources development, Industrial plants, Data collections, Hydrologic data.
Identifiers: *Yellow Creek Inland Port(Miss).

At the Yellow Creek State Inland Port Industrial Area, Mississippi, substantial quantities of groundwater are available for industrial use. Test drilling at five sites resulted in successful test wells at two sites. The aquifer is in chert and hydraulically connected gravel. Test pumping indicated that wells capable of yielding about 1 million gallons per day could be constructed at each of the two sites. Water produced by the test wells was soft and contained less than 50 milligrams per liter of dissolved solids. The iron content was less than 0.3 mg/liter and the average pH was 5.5. (Knapp-USGS)

HYDROGEOLOGIC DATA FROM GREELEY, WICHITA, SCOTT AND LANE COUNTIES, KANSAS,
Geological Survey, Garden City, Kan.
L. E. Stullken, E. C. Weakly, E. D. Gutentag, and S. E. Slagle.
Kansas Geological Survey Basic-Data Series Ground-Water Release No 4, 1974. 58 p, 1 fig, 1 plate, 4 tab.

Descriptors: *Basic data collections, *Hydrologic data, *Groundwater, *Kansas, Water wells, Aquifers, Water yield, Data collections.
Identifiers: *Greeley County(Kans), *Wichita County(Kans), *Scott County(Kans), *Lane County(Kans).

Records of 2,012 wells in Greeley, Wichita, Scott, and Lane Counties, Kansas, are presented. Included are 1,901 irrigation, 38 domestic or stock, 40 industrial or public supply, and 33 other wells. Chemical analyses from 133 representative wells are listed in this release. Lithologic logs of 104 test holes also are included. Groundwater withdrawal has increased concurrently with the number of wells in use. The number of irrigation wells in Greeley County increased from about 10 to 212 during 1951-72, the number of Wichita County increased from 70 to 808 during 1951-72, the number in Scott County increased from about 130 to 717 during 1945-72, and the number of Lane County increased from 5 to 164 during 1949-72. Yields to irrigation wells range from 100 to 2,000 gpm from the Ogallala Formation of Pliocene age and from 250 to 1,500 gpm from the alluvium and undifferentiated deposits of Pleistocene age. As much as 1,000 gpm of water may be available to wells in local areas from fractures and solution openings in the Niobrara Chalk. Yields of 30 to 300 gpm may be available from sandstone beds in the undifferentiated rocks (mainly Dakota Formation) of Early Cretaceous age. (Knapp-USGS)

AVAILABILITY OF GROUNDWATER FOR THE U.S. NAVY WELL FIELD NEAR FLORIDA CITY, DADE COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
F. W. Meyer.
Open-file report FL74014, 1974. 50 p, 18 fig, 1 tab, 13 ref.

Descriptors: *Groundwater, *Water yield, *Water resources development, *Military reservations, *Florida, Withdrawal, Analog models, Conjunctive use, Artificial recharge, Saline water intrusion.
Identifiers: *Florida City(Fla).

Enough groundwater is available in southeastern Dade County so that the U. S. Navy facilities at Key West can increase withdrawal from 6 million gallons per day to 18 million gallons per day. It is planned that future water requirements in southeastern Dade County--beyond the 18-million-gallon-per-day demand--be met chiefly by recharge from a pump-equipped conveyance canal for Conservation Area 3. An electrical analog model of the Biscayne aquifer, constructed in cooperation with the Central and Southern Florida Flood Control District was used to predict the effects that increased well-field pumpage would have on water levels. NUMERICAL ANALYSIS OF GROUNDWATER FLOWS,
FENCO, Toronto (Ontario).
G. D. Ransford.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 378-393, 1973. 4 fig, 5 ref.

Descriptors: *Groundwater movement, *Numerical analysis, *Computer programs, *Aquifer testing, *Uplift pressure, Sheet piling, Seepage, Aquifer characteristics, Simulation analysis.

Numerical analysis methods are discussed for analysis of well pumping tests to determine aquifer properties when the pumped discharge is not constant, analysis of flow into a circular sheet pile cofferdam driver into permeable material, and uplift under structures such as gravity dams or caissons, when well points are used for pressure relief. Charny's theorem enables the average uplift across a section to be calculated more readily than the uplift at individual points. The surfaces of the sheet piling and of the excavation within the cofferdam are simulated by ring vortices and by distributed sinks. Computer programs are presented for the problems. The case of a leaky aquifer is treated by evaluating the Hantush and Jacob leaky aquifer function. A computer program is given for drain design. (See also W74-12087) (Knapp-USGS)

THE APPLICATION OF A SIMULATION MODEL TO THE PLANNING AND MANAGEMENT OF WATER RESOURCES IN LANCASHIRE,
Lancashire River Authority (England).
P. D. Walsh.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 56-59, 25-27 September 1973. 1 fig, 2 tab, 3 ref.

Descriptors: *Water resources development, *Planning, *Management, *Simulation analysis, *Computer models, Computer programs, Water supply, Conjunctive use, Hydrologic data, Reservoirs, Sandstone, Aquifers, Rivers, Withdrawal, Operations, Inflow, Wells, Constraints, Systems analysis.
Identifiers: River authorities, Yield.

Several reservoirs and a sandstone aquifer are used conjunctively in a water supply scheme. One of the reservoirs and the aquifer are capable of further development and the yield of the system may be further increased by river abstractions. Described is the simulation model developed to investigate the yield of the scheme and the ways in which the system might be operated. The model accepts 46 years of data; pentad data is used for the reservoir inflows and mean daily flows for the rivers. All system parameters, license conditions and operating policies are specified as data for each run of the model. The program contains a number of output options, enabling different aspects of the system to be examined in detail. Output can be produced on an annual, monthly or daily basis. Through subsidiary programs, frequency analysis, graph plots, or listings of daily results may be produced. In future, this model will study system performance and operation during the construction period when demands on the system might exceed the available supplies. (See also W74-12107) (Bell-Cornell)

HYDRODYNAMICS OF ARTIFICIAL GROUNDWATER RECHARGE,
California Univ., Irvine. School of Engineering.
R. R. Brock.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 831, $4.75 in paper copy, $2.25 microfiche. Completion Report, February 1974. 135 p, 88 fig, 11 tab, 15 ref. OWRT C-3112(3687)(2), 14-31-001-3687.

Descriptors: *Artificial recharge, *Dupuit-Forchheimer theory, *Groundwater recharge, Hydrodynamics, Potential flow, Recharge ponds, *Porous media, Saturated flow, Water spreading, *Water table aquifers, Perched water, Laboratory tests, California, *Groundwater movement, *Leakage.
Identifiers: Perched recharge mounds, Semipervious layers, Sand models, Potential Theory, Strip basin, Square basin.

Ground-water recharge to a horizontal water table and to a semipervious layer were investigated. The saturated flow equations for a homogeneous isotropic medium were used to find theoretical solutions. Experiments were conducted in a laboratory sand model. Field observations of recharge mounds developed beneath square ponds near Fresno, Calif., were also utilized. For the horizontal water-table case the classical Dupuit-Forchheimer (D-F) theory and the more exact potential (P) theory were used. For each theory a linear (L) and nonlinear (NL) version were used. Solutions for a dimensionless water-table rise were obtained using the LDF, NLDF, LP and NLP theories for a strip basin. Most of these were obtained by a finite-difference solution of the equations. For a square basin the LDF and NLDF theory were used. In general it was found that for a shallow flow (which occurs when the ratio of initial depth to basin width is sufficiently small) and small water-table rise the LDGF theory is valid, whereas for larger rises the nonlinear effects are important and the NLDF theory must be used. The laboratory results for shallow flows were in close agreement with the NLDF theory. For deep flows the D-F theories are inadequate and the potential theories must be used. The NLP theory was used to obtain detailed flow patterns for both a shallow and deep flow case. For perched mounds on a semi-pervious layer the NLDF theory was used to develop solutions for the mound shape for strip and square basins. Laboratory expermints for steady state perched mounds beneath a strip basin were conducted in a sand model. For small leakage rates the NLDF theory compares favorably with the experimental results. For large leakage rates the NLDF theory is not adequate, probably because of relatively large vertical velocities. A method was developed to determine the permeabilities of the semi-pervious layer and sand above the layer from observed steady-state mound shapes and recharge rates. The method is illustrated with field data from a square pond.

MULTILEVEL OPTIMIZATION FOR CONJUNCTIVE USE OF GROUNDWATER AND SURFACE WATER,
Case Western Reserve Univ., Cleveland, Ohio. Systems Research Center.
W. Yu, and Y. Y. Haimes.
Water Resources Research, Vol 10, No 4, p 625-636, August 1974. 7 fig, 6 tab, 22 ref, 2 append.

Descriptors: *Conjunctive use, *Systems analysis, *Optimization, Groundwater resources, Surface waters, Water resources, Municipal water, Recharge, Imported water, Irrigation water, Industrial water.
Identifiers: *Regional authority, *Multilevel systems, *Local water agency, Pumping tax, Agricultural demand, Management models, Asymmetrical grid network model.

A general systems analysis approach, not using straight simulation methods, was applied to the problem of optimal conjunctive use of groundwater, local surface water, and imported water resources. A water resources management problem was considered for a hypothetical region composed of several adjoining subregions overlying a common aquifer. The aquifer was represented by a two-dimensional asymmetrical grid network model. Local water agencies had exclusive rights for developing and controlling all water resources in its subregion. Water demands

for each subregion were classified as agricultural or municipaleindustrial. A regional water authority optimally regulated the region's water resources by establishing intersubregional aquifer boundary conditions, and by imposing a pumping tax to pay the cost of recharging the aquifer. The solution was implemented by a completely decentralized decision making structure of two level hierarchy. (Adams-ISWS)

Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 100, No IR3, Proceedings Paper 10785, p 245-253, September 1974. 4 fig, 18 ref, 2 append.

Descriptors: *Alluvial aquifers, *Drainage systems, *Subsurface drainage, *Groundwater, *Irrigation, Darcys Law, Water table, Tunneling, Tunnel construction, Conduits.
Identifiers: *Ghanats, *Iran.

The Ghanats of Iran are one of the oldest systems of water supply in the world. A Ghanat is a subsurface drain that brings mountain groundwater to arid plains by means of a man made gravity flow channel. The estimated 50,000 Ghanats in Iran provide from 1/3 to 1/2 of all irrigation water in the country. Their features and construction methods were described. As a Ghanat behaves like a drain, its dicharge is proportional to the length of its wet part and to the difference of head existing between the axis of the tunnel and the regional water table. The actual complex flow conditions of a Ghanat must be simplified to obtain an approximate solution for the transient water table. A simplified approximate theory based on Darcy's Law was presented and the resulting equations were evaluated in terms of different parameters for two representative cases. (Sanderson-ISWS)

INDUCED INFILTRATION AT THE UNIVERSITY OF CONNECTICUT WELL FIELD,
Connecticut Univ., Storrs.
M. T. Giddings.
M Sc thesis, 1966. 35 p, 9 fig, 1 tab, 20 ref, append.

Descriptors: Rivers, *Groundwater, Underflow, Alluvium, Pump testing, *Induced infiltration, *Connecticut.
Identifiers: *Fenton River(Conn), Outwash, Ice-contact deposits, Recharge boundary.

Flow measurements of the Fenton River made during a 21 day study period suggest that the river loss due to induced infiltration to the adjacent well field varies with the pumpage from the well field. The aquifer unity supplying the well field is composed of alluvium, outwash, and ice-contact deposits. Ground water underflow percolating downvalley through this aquifer unit provides a part of the water pumped from the well field. The balance of the water pumped is supplied by induced infiltration from the Fenton River. Water table levels measured during the study period also show fluctuations corresponding to pumpage fluctuations. Additional pump test data indicate that the Fenton River is a recharge boundary for the aquifer unit. Calculations based on the river loss measured during the 21 day study period indicate that an average of 40% of the water pumped from the University of Connecticut well field is derived from the Fenton River by induced infiltration. The lowering of the water table by pumping the wells located near the river induces the infiltration of river water into the underlying aquifer unit. Induced infiltration at the University of Connecticut well field causes a decrease in the flow of the Fenton River it passes the well field. (Campbell-NWWA)

ANALYSIS OF PUMPING WELL NEAR A STREAM,
Arizona Univ., Tucson.
S. A. Bhatti.
M Sc thesis, 1967. 103 p, 17 fig, 13 tab, 23 ref, 5 append.

Descriptors: *Aquifer characteristics, Streams, *Pump testing, Infiltration, *Drawdown, Salinity, Irrigation, *Groundwater, Specific yield.
Identifiers: *Tube well discharge, Water-logging, Coefficient of transmissibility, Coefficient of storage, Surface water-ground water relationships.

A pumping test was conducted to evaluate aquifer characteristics, the percentage of tube well discharge derived from the stream, and the effective distance to the stream simulated as a fully penetrating plane source of constant head. The formulae are applicable although a natural stream is seldom fully penetrating, because the distance from the stream to an equivalent fully penetrating but imaginary plane source can be calculated. When pumping begins, the tube well contains most of its water from the immediate vicinity, but as the cone of influence expands, it receives a part of its water from the stream until a time is reached when it draws the entire amount of water from the stream. This will of course, depend upon the aquifer characteristics, the tube well discharge, distance of the tube well from stream and the infiltration regimen of the stream. Different methods were used to find the distance of stream equivalent to a fully penetrating plane source, the determination of coefficient of transmissibility and coefficient of storage, and, the amount of water that the tube well intercepts from the stream. CAN FREEZING IMPROVE WELLS IN CONSOLIDATED ROCK AQUIFERS,
Food and Agriculture Organization of the United Nations, Rome (Italy). Land and Water Development Div.
D. J. Burdon.
Johnson Drillers Journal, p 5, May-June, 1974.

Descriptors: Aquifer management, Confined aquifers, Consolidation, Storage capacity, *Groundwater, Fissures(Geologic), Cracks, Expansion joints, Irrigation systems, Irrigation wells, *Freezing, Boreholes, Crystallinization, Fractures(Geologic).
Identifiers: *Consolidated rock aquifers, Joint-fissure systems.

Finding ways to increase aquifer storage capacity and yield from wells that tap consolidated rock aquifers is more necessary than ever in some areas of the world where food production must be constantly increased. Freezing the groundwater within the joints and fissures of jointed-fractured rock has some possibility of attaining these ends. Water expands as it freezes. Use of this means to open up and to extend existing joints and fissures appears to be a new concept. It is suggested that by freezing the groundwater in and around the groundwater extraction structure, the expansion of the water will open up the joints, cracks, and fissures. Even though some reclosing of the joints seems likely, the operation will increase the storage capacity of the rock reservoir around the well and allow more water to be pumped each year. New approaches are required and should be tested. The idea presented appears to merit a further study of existing data and methods, followed by identification and testing of approaches which can be considered likely to yield positive results. (Campbell-NWWA)

THE COST OF GROUNDWATER VS. SURFACE WATER,
Moody and Associates, Meadville, Pa.
J. F. Howard.
Water Well Jornal, Vol 28, No 8, p 35-37, August, 1974.

Descriptors: *Cost comparisons, Groundwater, *Groundwater availability, *Decision making, Management, Cost allocation, Economics, Planning, Programs, Water wells, Drilling, Aquifer testing, Aquifer management, Groundwater resources, *Groundwater potential, Cost-benefit analysis, Distribution systems, Maintenance costs, *Surface waters, Municipal water.
Identifiers: Capital expenditures, Production costs, Financial implementation.

The normal sequence of decision-making involved in planning the development of large volume water supplies needed to meet rising industrial or municipal demands has, in the past, badly underestimated groundwater as a reliable low-cost water resource. The greater visibility, aesthetic appeal, and so-called multiple-use concepts of lakes and surface water bodies combined with an undeserved groundwater reputation for unreliability has produced a general philosophical orientation toward the use of surface supplies by those responsible for determining the best long-term source available. Most of the reputation concerning groundwater unreliability is due to a low level of awareness concerning the groundwater system, its controls, and its advantages on the part of many of those involved in the decision-making process. The question of reliability has risen primarily in those areas where proper utilization of the procedures necessary for accurate evaluation and establishment of well-field management plans have not been employed. The overall advantages of groundwater as a longterm water supply source are overwhelming. A few of the more significant facets are described: total reserves, lower contamination potential, physico-chemical stability of groundwater, cost-benefit considerations. (Campbell-NWWA)

A GROUNDWATER INVESTIGATION OF THE LUMMI INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, Wash.
D. R. Cline.
Open-File Report, 1974. 66 p, 9 fig, 5 tab, 11 ref, append.

Descriptors: *Groundwater, *Water resources, *Indian reservations, *Washington, Aquifers, Water yield, Water quality, Water supply, Saline water intrusion.
Identifiers: *Lummi Indian Reservation(Wash).

Both fresh and daily groundwater underlie the Lummi Indian reservation, Washington. This water is sometimes stratified, with the freshwater lying above the salty water. Significant quantities of fresh groundwater are found beneath Lummi Peninsula and beneath the western part of the reservation. The yields of wells range from less than 1 to 400 gallons per minute. The two most promising areas for the development of additional groundwater supplies are in the western part of the reservation just southeast of Neptune Beach, and the central part of Lummi Peninsula. Although serious saltwater intrusion has not yet been detected on the reservation, some wells may be showing the first signs of it, such as at Gooseberry Point. There, the chloride content of the water from the two public-supply wells has been slowly increasing, from 24 milligrams per liter in 1968 to 110 milligrams per liter in 1972. The quantity of groundwater withdrawn on the reservation in 1972 was about 41 million gallons, about double that in 1965. The fresh groundwater is generally of good quality. (Knapp-USGS)

APPRAISAL OF OPERATING EFFICIENCY OF RECHARGE BASINS ON LONG ISLAND, NEW YORK, IN 1969,
Geological Survey, Washington, D.C.
D. A. Aronson, and G. E. Seaburn.
Available from Sup Doc, GPO, Washington, D.C. 20402, Price $1.45 (paper cover). Geological Survey Water-Supply Paper 2001-D. 1974. 22 p, 8 fig, 1 plate, 2 tab, 31 ref.

Descriptors: *Artificial recharge, *Storm runoff, *Urban hydrology, *New York, Hydrogeology, Glacial drift, Urban runoff, Infiltration, Clogging, Groundwater movement, Water management(Applied).
Identifiers: *Long Island(NY).

Recharge basins on Long Island are unlined pits of various shapes and sizes excavated in surficial deposits of mainly glacial origin. Of the 2,124 recharge basins on Long Island in 1969, approximately 9% (194) contain water 5 or more days after a 1-inch rainfall. Basins on Long Island contain water because (1) they intersect the regional water table or a perched water table, (2) they are excavated in material of low hydraulic conductivity, (3) layers of sediment and debris of low hydraulic conductivity accumulate on the basin floor, or (4) a combination of these factors. A larger percentage of the basins excavated in the Harbor Hill and the Ronkonkoma morainal deposits contain water than basins excavated in the outwash deposits. A larger percentage of the basins that drain industrial and commercial areas contain water than basins that drain highways and residential areas. Storm runoff from commercial and industrial areas and highways generally contains high concentrations of asphalt, grease, oil, tar, and rubber particles, whereas runoff from residential areas mainly contains leaves, grass cuttings, and other plant material. Differences in composition of the soils within the drainage areas of the basins on Long Island apparently are not major factors in causing water retention. Evaporation does not significantly concentrate the chemical constituents and, therefore, evaporation is not a major mechanism of water disposal from these basins. (Knapp-USGS)

INTERNATIONAL WORKSHOP ON THE HYDROLOGICAL EFFECTS OF URBANIZATION, WARSAW, 1973.
American Society of Civil Engineers, New York.
ASCE Report to National Science Foundation on International Workshop, January 1974. 61 p. NSF Grant GK-35974.

Descriptors: *Urbanization, *Urban hydrology, *Conferences, *International Hydrological Decade, Research and development, Rainfall-runoff relationships, Climatology, Water quality, Water pollution, Ecology, Environmental effects.

An International Workshop was held by IHD-UNESCO on the Hydrological Effects of Urbanization. The developed countries have already experienced the effects of urbanization on the hydrological cycle, and urbanization of areas is increasing with the likelihood that further damage will be done. There is also evidence that urbanization will increase in the developing countries and that problems will arise there similar to those that have been encountered elsewhere. The effects of

water pollution from large-scale mining operations are comparable to those from industries. Urban areas affect, and are affected by, distant human activities. Among the obvious effects are increased population densities and increased concentrations of residential, industrial and commercial buildings and facilities, with resultant increases in areas that are impervious. Hydrological impacts then include the effects of these changes on the natural drainage, runoff, groundwater, sediment, water quality, water demands, and on measures utilized for the disposal of wastes and surplus water and for the supply of water. Among the hydrological problems associated with urbanization are the continually increasing demands for water for various uses, changes in the physical environment that alter the natural water balance, and the disposal of wastes that may contaminate streams and groundwater. The most important topics for research are changes in surface runoff caused by urbanization; quantity and quality of runoff; soil moisture and groundwater; water demand forecasting; water quality effects related to groundwater; and effects of waste water and sludge on the natural purification capacity of receiving waters and on aquatic life. 4D. Watershed Protection

WATERSHED VALUES IMPORTANT IN PLANNING,
Forest Service (USDA), Franklin, N.C. Southeastern Forest Experiment Station.
J. E. Douglass.
In: Optimizing the South's Forest Resources, Proceedings of the Second Regional Technical Conference, March 11-15, 1974, Houston, Texas, Astroworld Hotel, Texas Forest Service, College Station, p 59-73. 3 fig, 1 tab, 37 ref.

Descriptors: *Land use, Planning, *Water resources development, Water resources, *Water quality, Streams, Runoff, *Stream regimen, Water pollution sources, Water pollution treatment, Watershed protection, *Southeastern U.S.

Forests cover 20 to 65 percent of the land in the major water resource regions of the South, and forest management practices control or regulate the volume and timing of streamflow from these lands. Although water quality is emerging as the major water problem, quality and timing of streamflow will be important and interrelated watershed values which should be considered in land use planning. Protection or improvement of hydrologic performance of forest soils will continue to be an important consideration in planning.

WATERSHED PROJECTS.
Hearings--Subcomm on Conservation and Credit, Comm on Agriculture, U.S. House of Representatives, 93rd Cong, 1st Sess, May 8, 21, and October 30, 1973. 98 p.

Descriptors: *Watershed management, *Federal government, *Flood protection, *Channeling, Water management(Applied), Watersheds(Basins), Flood control, Water control, Channel improvement, Dams, Erosion control, Flood plains, Multiple-purpose projects, Reservoirs, Flood plain zoning, Watershed Protection and Flood Prevention Act, Rivers, Streams, Organizations, Administrative agencies, Governmental interrelations, Soil management.
Identifiers: *Congressional hearings.

Hearings were conducted to obtain general testimony regarding nine watershed projects proposed by the Soil Conservation Service (SCS). The projects primarily enhanced watershed protection and flood prevention. The projects considered were: Bacon Creek, Iowa; Carbon Hill Watershed, Montana; Cow Creek, Oklahoma; Lost Creek, Missouri; Nutwood Watershed, Illinois, Oolenoy River, South Carolina; Prichett Creek, West Virginia; Tallulah Creek, North Carolina; Truth or Consequences-Williamsburg Arroyos, New Mexico. The SCS made detailed presentations, including environmental impact statements, on each of the projects. Statements by interested Congressmen and other officials were also submitted. Representatives of the Environmental Policy Center and Environmental Action voiced opposition to those projects which involved channelization. Environmental Action recommended that flood plain zoning be implemented in all watersheds prior to construction and that the SCS be given authority to veto zoning variances granted even after project completion. While the environmental impact statements prepared by the Department included the adverse ecological effects which would result from certain projects, the statements by the two environmental groups were the only testimony in opposition to any of the projects. SAND GULLYING IN A SAHELIAN SITE: OBSERVATIONS DURING RECENT RAINFALL IN THE NOUAKCHOTT REGION (MAURITANIA),
Institut Fondamental d'Afrique Noire, Dakar (Senegal). Dept. of Geography.
C. Barbey, and J. Carbonnel.
C R Hebd Seances Acad Sci Ser D Sci Nat. Vol 274, No 22, p 2933-2935. 1972. Illus.
Identifiers: *Erosion, *Gullies, Mauritania, Nouakchott, *Rainfall intensity.

Rainfall intensity was indicated by splashes on Euphorbia up to 25 cm from the soil, and soil moisture at a depth of 10 cm. The shrub vegetation is the principal factor causing streaming. The presence of nebkas, and their density (on the average 1/5 m) promote the concentration of the streaming in the resulting natural channels. This flow canalization partly accounts for the torrential aspect of the ravine forms. The plant cover also influences the types of erosion through the roots. Euphorbia roots act as preferential penetration axes for the percolation water. The fine and diffuse roots of Panicum form resistance islets against streaming. The drooping stems provide extra protection.--Copyright 1973, Biological Abstracts, Inc.

TOXIC METALS IN SEDIMENTS,
Oak Ridge National Lab., Tenn.
E. A. Bondietti, R. R. Perhac, F. H. Sweeton, and T. Tamura.
In: ORNL-NSF-EATC-6, p 176-194, January 1974. 3 fig, 5 tab, 11 ref.

Descriptors: *Toxicity, *Toxins, Ecology, *Sediments, Analysis, *Assay, Chemicals, Soil analysis, Cadmium, Nickel, Marshes, Wetlands, *New York, Pollutant identification.
Identifiers: *Foundry Cove(NY).

Two distinctly different sediment samples taken from a cadmium- and nickel-contaminated marsh in Foundry Cove, New York, were characterized with respect to chemical forms of cadmium and nickel present. Sediment particle separations using density gradient centrifugation revealed the presence of mixed cadmium-calcium carbonates in the most contaminated sediment (3.9% Cd). The second sediment sample, which had less total cadmium (0.19%) and no CdCO3, contained three times as much exchangeable Cd(2+) as the higher cadmium sediment and maintained approximately the same Cd(2+) concentration in solution. Thus, the availability of cadmium from the two samples may not be in proportion to their total cadmium contents. The results of the characterization study emphasize the necessity for studying chemical forms rather than just total amounts. More than one site is suggested for studies of this type. DEVELOPMENT OF HIGH SENSITIVITY X-RAY FLUORESCENCE FOR ANALYSES OF TRACE TOXIC ELEMENTS,
Oak Ridge National Lab., Tenn.
C. J. Sparks, Jr., J. C. Ogle, H. W. Dunn, and L. D. Hulett.
In: ORNL-NSF-EATC-6, p 243-269, January 1974. 7 fig, 3 tab, 8 ref.

Descriptors: *Analytical techniques, *X-ray fluorescence, *Fluorescence, Research and development, Ecology, Environment, *Trace elements, Instrumentation, Design criteria, Spectroscopy.
Identifiers: High sensitivity, *Collimators.

Methods for using x-ray fluorescence for quantitative determination of trace elements in samples of environmental interest are given. Monoenergetic exciting x-rays obtained by using a doubly bent hot-pressed pyrolytic graphite monochromator with a standard x-ray tube and solid-state detector system allow the determination of trace elements to levels of a few parts per million. Geometrical considerations in the design of the x-ray detection collimator system are discussed, and the measurements of the necessary parameters for converting observed fluorescent intensities into quantitative units are described. Descriptors: *Analytical techniques, Environment, *Pollutant identification, *Pollutants, Research and development, Analysis, Assay, Evaluation, Instrumentation, Measurement, *Tennessee, *Spectrophotometry.
Identifiers: *Walker Branch Watershed(Tenn).

The purpose is to develop practical analytical methods for analysis of environmental pollutants using the GeMSAEC Fast Analyzer. During this report period a second GeMSAEC analyzer was acquired and instrument development for measurement of light emission signals was essentially completed. A signal amplifier was designed and fabricated, and a light-emitting diode (LED) was installed in place of the tungsten lamp on the second analyzer. A new modified FOCAL compiler was prepared for luminescence measurements and computer programming for implementing spectrophotometric, turbidimetric, and kinetic methods of analysis was completed. Specific methods that were developed are included. (See also W74-12021) (Houser-ORNL)

SEPARATION, DETECTION, AND IDENTIFICATION OF ORGANICALLY BOUND TOXIC METALS AND OTHER HAZARDOUS MATERIALS,
Oak Ridge National Lab., Tenn.
Y. Talmi.
In: ORNL-NSF-EATC-6, p 282-303, January 1974. 5 fig, 5 tab, 18 ref.

Descriptors: *Analytical techniques, Research and development, *Metals, *Toxins, Toxicity, Trace elements, Chemistry, Instrumentation, Laboratories, Mercury, Air pollution, Water pollution, Arsenic, Selenium, Chromatography, *Gas chromatography, Microwaves, *Pollutant identification, Spectrophotometry.

A gas chromatograph-microwave emission spectrometric detector (GC-MES) system has been built and applied to a variety of analytical and physical problems. The sensitivity of the MES detector is affected insignificantly by the molecular structure of the sought compound. Thus the detection limit for (CH3)2Hg, CH3HgCl and C2H5HgCl is 6, 7 and 4 pg, respectively. This system was successfully applied to the analysis of CH3HgCl at various concentration levels in fish tissue. The procedure is significantly simpler than any other, and the relative sensitivity is at the 5 ppb level. The high accuracy, precision, and flexibility provided by this technique are demonstrated in a physical chemistry study made to determine the following subjects: (1) kinetics of the reaction of halogens with CH3HgX, (2) solubility of CH3HgCl in H2O, (3) vapor pressure of CH3HgCl and (4) determination of air/water distribution coefficient for (CH3)2Hg. MEASUREMENT OF MOLECULAR ORGANIC CONTAMINANTS IN POLLUTED WATER BY LIQUID CHROMATOGRAPHY,
Oak Ridge National Lab., Tenn.
W. W. Pitt, R. L. Jolley, S. Katz, and G. Jones.
In: ORNL-NSF-EATC-6, p 304-316, January 1974. 3 fig, 2 tab, 11 ref.

Descriptors: Wastes, *Measurement, *Organic compounds, *Water pollution, Research and development, Assay, Absorption, Oxidation, *Chromatography, Evaporation, Ion exchange, Cation exchange, Toxicity, Public health, *Pollutant identification, *Organic wastes.

Trace organic compounds present in natural waters are being separated and identified with the aid of high-resolution liquid chromatography (HRLC). The chromatographic system currently being used is capable of separating and detecting as many as 150 ultra-violet-adsorbing compounds and/or compounds oxidizable with sulfatoceric acid in a single sample. Concentration factors as large as 10(4th) have been obtained with less than 10% loss of dissolved organic carbon using two-stage, low-temperature evaporation preceded by cation exchange to remove inorganic salts. Samples from six chosen sites have been collected, concentrated, and chromatographed. These sites were chosen so as to be representative of various types of natural waters; unpolluted and polluted; small streams, rivers, and lakes, etc. In addition to these, a sample of the sodium humate fraction of a soil extract was chromatographed. RAPID 15-N ISOTOPIC-RATIO ANALYTICAL SYSTEM FOR ENVIRONMENTAL SAMPLES,
Oak Ridge National Lab., Tenn.
J. A. Carter, D. R. Matthews, R. L. Walker, and J. R. Walton.
In: ORNL-NSF-EATC-6, p 317-329, January 1974. 4 fig, 5 tab, 11 ref.

Descriptors: *Nitrogen, Measurement, Environment, Sampling, Assay, *Analytical techniques, *Spectrometers, Gases, Chemistry, Chemical reactions, *Radioisotopes, *Pollutant identification.

An analytical system for measuring total nitrogen and its isotopic abundance in a variety of environmental samples has been developed. A reductive pyrolysis system and a directional focusing 6-in. gas mass spectrometer were combined into the analytical system. In the reductive part of the system, nitrogen species are converted to ammonia with an atmosphere of hydrogen in the presence of a heated nickel catalyst. Five percent of the gas stream is split for measuring total nitrogen by a conductivity detector. The ammonia is removed from the gas stream by employing a cold-finger reaction vessel. The hydrogen-free ammonia is decomposed thermally to nitrogen and hydrogen at 1000 C, by using a hot rhenium filament. The N-2 produced from the decomposition is used for measuring the abundance of masses 28 and 29 by mass spectrometry. From this ratio, the N-15 atom fraction is calculated. LEAK DETECTION IN UNDERWATER OIL PIPELINES,
National Maritime Research Center, Galveston, Tex. Cargo Handling and Terminals Program.
P. A. Jackson.
Available from NTIS, Springfield, Va 22161 as COM-73-11776 Price $3.00 printed copy; $2.25 microfiche. NOAA Report 272-23100-R2, September 1973: 32 p, 14 fig, 1 tab.

Descriptors: *Oil spills, *Monitoring, *Water pollution control, *Leakage, *Instrumentation, Acoustics, Telemetry.
Identifiers: *Leak detection.

Leak detection devices suitable for underwater oil pipelines are discussed. The review includes consideration of leak or crack detection by flow measurement, pressure, ultrasonics, acoustic emission, magnetic flux, visual examination, eddy current, radioactive slugs, electromechanical and electrochemical tapes, doublewalled pipes, coaxial cable, lasers, permeable membranes, and remote sensing. The review was performed to provide appropriate pollution control information prior to the construction of underwater oil pipelines from deep water tanker terminals to shore facilities. It is recommended that a stationary ultrasonic through-the-pipe-wall crack/flow detector be used with a coaxial cable and shroud positioned a short distance above the pipe. (Knapp-USGS)
W74-12065

BAILEY OIL CONTENT MONITOR,
Esso Research and Engineering Co., Floram Park, N.J.
J. O. Moreau, and J. J. Heigl.
Available from NTIS, Springfield, Va 22161 as COM-73-10940, Price $3.00 printed copy; $2.25 microfiche. Final Contract Report to Maritime Administration, April 1973. 88 p, 14 fig, 3 append. Contract No C-1-35049.

Descriptors: *Oil pollution, *Water pollution control, *Monitoring, *Ships, Oil water, Instrumentation, Fluorescence, Fluorometry.

A device to monitor oil in the overboard discharge of ballast water was evaluated. The unit and ancillary equipment items meet shipboard requirements for mechanical rigidity and intrinsic safety. The Bailey Monitor was tested aboard the Esso Scotia. The system is sufficiently sensitive to detect low concentrations of crude oil in water. As a quantitative measuring device, a number of factors affected the accuracy of the system. These included improper calibration and signal saturation effects which can introduce small to major errors in the readings. These errors can be greatly reduced. (Knapp-USGS)

ASPECTS OF MONITORING AND CONTROL OF WATER QUALITY,
Great Ouse River Authority (England).
R. H. Billington, N. Taylor, and D. C. Young.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 181-208, 25-27 September 1973. 9 fig, 4 tab, 15 equ.

Descriptors: *Water quality control, Computers, *River basins, *Systems analysis, *Data processing, Management, Monitoring, Sampling, Pollutants, Statistics, Simulation analysis, Projects, Mathematical models.
Identifiers: *Great Ouse River basin(England).

Outlined are some simple techniques used in electronic data processing that have been developed for use in the day-day management of water quality within the Great Ouse River Authority area. The routine surveillance scheme in operation there is described. Examples of computer usage are discussed. Considered are a sampling frequency, a pilot study, the processing of water quality, data presentation, management information service, and monitoring. Next, there is a discussion of the more advanced computer-based techniques being developed and used for a systems analysis study of water quality in the Bedford Ouse River basin. Considered are short- and long-term management and operational control of river water quality and the characteristics of existing analytical models, such as the Streeter-Phelps model and Monte Carlo simulation. The limitations of the computer in water resource system planning and management are mentioned briefly. (See also W74-12107) (Bell-Cornell)
W74-12117

COMPUTER ASSISTED QUANTITATIVE SPECTROGRAPHIC ANALYSIS,
Water Research Association, Marlow (England).
R. Crabbe.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 60-62, 25-27 September 1973.

Descriptors: *Water chemistry, Computers, *Water sampling, *Trace elements, Digital computers, Equations, *Water quality control, *Pollutant identification.
Identifiers: *Spectrographic analysis, Quantitative assessment.

Valuable savings have been achieved in time and expense at the Water Research Association by using a computer to perform calculations necessary in the quantitative assessment of trace elements in water samples. This short paper details the method of spectrographic analysis; computing considerations are accounted for. Use of a digital computer is the best and most convenient means of improving speed of calculation. (See also W74-12107) (Bell-Cornell)
W74-12137

BIOLOGICAL METHODS FOR THE ASSESSMENT OF WATER QUALITY (SYMPOSIUM PRESENTED AT THE 75TH ANNUAL MEETING, AMERICAN SOCIETY FOR TESTING AND MATERIALS, LOS ANGELES, CALIF., 26-29 JUNE 1972).
American Society for Testing and Materials, Philadelphia, Pa.
ASTM Special Technical Publication No 528, 1973, J. Cairns, Jr., and K. L. Dickson, editors. 256 p ($16.25).

Descriptors: *Conferences, *Water quality, *Water analysis, *Aquatic organisms, *Bioindicators, *Bioassay, *Analytical techniques, *Pollutant identification, Monitoring, Discharge(Water), Water pollution, Water pollution control, Pollution abatement, Aquatic life, Biochemical oxygen demand, Toxicity, Mixing, Mixolimnion, Effluents, Indicators, Path of pollutants, Quality control, Water management(Applied), Sampling, Laboratories.

The proceedings of an ASTM symposium on the biological assessment of water quality, held June 26-29, 1972 in Los Angeles, Calif., comprise 17 technical contributions by different authors. They deal with the following topics: Interaction of engineers and biologists in water quality management; pollutant bioassay and sampling techniques; internal and external rapid monitoring systems for effluent discharges and polluted receiving streams; mixing zone concepts; BOD tests; the use of fish, algae, diatoms, bacteria, aquatic invertebrates, and other aquatic organisms as pollution indicators; histological and histochemical diagnoses and prognoses of pollutant effects; toxicity tests; and mobile bioassay laboratories. THE ABC'S OF POLLUTANT BIOASSAY USING FISH,
Guelph Univ., (Ontario). Dept. of Zoology.
J. B. Sprague.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 6-30. 6 fig, 47 ref.

Descriptors: *Bioassay, *Toxicity, *Water pollution effects, *Analytical techniques, *Testing procedures, Fish, Aquatic organisms, Fishkill, Statistical methods, Mixing, Trout, Rainbow trout, Lethal limit, *Pollutant identification.
Identifiers: Sublethal effects, Chronic effects.

A recommended method for testing the acute toxicity of pollutants to fish is described. Among improved procedures advocated are mainly more frequent observations of mortality and use of simple statistical treatment. The four-day lethal concentration or the lethal threshold concentration should be used as final expression of test results. Toxicity curves should be constructed as the experiment progresses, for the information of the investigator. Tests, whether static or continuous-flow, should provide at least 2, preferably 3 liters of test water per gram of fish per day, and should not be aerated. Standard species, such as rainbow trout, are recommended. Effects of mixtures should be assessed by adding toxicant concentrations which have been expressed as fractions of the lethal concentration. Some suggestions are also made for using the standard bioassay technique in studies of sublethal and chronic effects. (See also W74-12174) (Brown-IPC)

BIOLOGICAL MONITORING OF THE AQUATIC ENVIRONMENT,
Environmental Protection Agency, Cincinnati, Ohio. Analytical Quality Control Lab.
C. I. Weber.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 46-60. 5 fig, 2 tab, 51 ref.

Descriptors: *Water quality control, Waste water(Pollution), *Pollutant identification, *Water pollution, Bioassay, Water analysis, Analytical techniques, Aquatic life, *Monitoring, Federal government, *Data collections, *Sampling, Standards, *Water quality standards, Computer programs, Laboratory tests, Ohio, United States, Aquatic microorganisms, Aquatic organisms, Coordination, Federal project policy.
Identifiers: STORET(Computer program).

A nation-wide water quality monitoring network operated from 1957 to 1968 in Cincinnati by a central Federal laboratory was decentralized in 1968, responsibility for its operation being transferred to regional offices of the Federal Water Quality Administration. An Office of Monitoring was established after creation of the Environmental Protection Agency to provide overall technical coordination of the monitoring program and to standardize methodology and maintain quality control of the data. Four types of monitoring have been identified: ambient trend, source, case preparation, and research monitoring. The monitoring network of the EPA will comprise 5000 to 10,000 EPA-funded stations plus 40,000 to 50,000 stations operated by state and local agencies. Data are to be stored in a central EPA computerized system called STORET. The Analytical Quality Control Laboratory (AQCL) in Cincinnati is charged with responsibility for quality control and for development, validation, and standardization of chemical, microbiological, and biological methods for water and waste water analyses. Biological methodology employed in the EPA's monitoring task deals mainly with sample collection and processing, counting and identification of aquatic organisms, biomass estimation, measurements of bioaccumulation and biomagnification of pollutants, and processing and interpretation of biological data. The QCL conducts research in all areas of biological methods for water quality monitoring, develops reference samples for quality control, and conducts agency-wide interlaboratory methods studies. A biological methods manual was to be prepared and made available in 1973. (See also W74-12174) (Brown-IPC)
W74-12178

BACTERIA AND THE ASSESSMENT OF WATER QUALITY,
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
T. L. Bott.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 61-75. 74 ref.

Descriptors: Aquatic bacteria, Aquatic microorganisms, *Bacteria, *Water quality control, *Monitoring, *Bioassay, *Metabolism, *Bioindicators, Indicators, Coliforms, Microorganisms, Biomass, Measurement, Analytical techniques, Testing procedures, Water quality, Sanitary engineering, Water treatment, Waste disposal, Water pollution, Pollution abatement, Water pollution control, Water analysis, Water pollution effects, *Pollutant identification.
Identifiers: Mineralization.

Bacteria are important to water quality evaluations, firstly because certain organisms may be used as pollution indicators, and secondly because bacteria have diverse metabolic capabilities causing the mineralization of substances which other organisms are unable to metabolize. Limitations of widely used coliform procedures are discussed. Some new approaches to the detection of fecal organisms are presented, along with methods for determining bacterial biomass. Measures of bacterial activity are more desirable than biomass estimates, because water quality is affected by the activity of microorganisms. Recent approaches to the direct assessment of bacterial growth and metabolism in natural habitats are outlined. (See also W74-12174) (Brown-IPC)
W74-12179

USE OF ALGAE, ESPECIALLY DIATOMS, IN THE ASSESSMENT OF WATER QUALITY,
Academy of Natural Sciences, Philadelphia, Pa. Dept. of Limnology.
R. Patrick.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 76-95. 7 fig, 1 tab, 41 ref.

Descriptors: Algae, *Bioindicators, Aquatic organisms, *Aquatic algae, *Diatoms, Water quality control, *Monitoring, *Bioassay, Testing procedures, Analytical techniques, Water analysis, *Pollutant identification, Water pollution effects, Laboratory tests, Water quality, Metabolism, Plant physiology, Ecology, Artificial substrates.
Identifiers: Environmental surveys.

Two different approaches to the evaluation of algae as reliable water quality indicators are discussed. One approach involves observation and analysis of natural communities, in which the effect of a pollutant can be estimated by shifts in species composition and structure of the community. The other approach is to study a single species or a few selected species in laboratory cultures under carefully regulated conditions. Such studies are valuable in determining the physiological and morphological changes in function rates and polymorphism due to concentration of a given chemical or physical factor. (See also W74-12174) (Brown-IPC)
W74-12180

USE OF AQUATIC INVERTEBRATES IN THE ASSESSMENT OF WATER QUALITY,
Utah Univ., Salt Lake City. Dept. of Zoology.
A. R. Gaufin.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 96-116, 9 fig, 27 ref.

Descriptors: Water pollution effects, Water pollution control, *Monitoring, *Bioindicators, *Aquatic insects, *Invertebrates, *Bioassay, Testing procedures, Water quality control, Insects, Water pollution, Dissolved oxygen, Biology, Water beetles, Ecological distribution, *Pollution identification, Ecosystems, Aquatic life, Water quality.
Identifiers: Macroinvertebrates, Septic zone.

Since pollution affects primarily living organisms, biological studies of polluted waters have advantages over chemical water analyses: They are less time-consuming and provide a record of prevailing conditions unaffected by temporary effluent alleviations. Earlier studies in Lytle Creek (Ohio) revealed that little reliance can be placed on the mere occurrence of a single species in a given locality as a pollution indicator. The nine most numerous macroinvertebrate species in the septic zone also occurred in the recovery and clean water zones, though in smaller numbers. The septic zone contained less than 20% as many species as the clean zone, but many times the total number of organisms per unit area, namely, species adapted to live in low dissolved oxygen concentrations or capable of securing their oxygen directly from the air. The clean zone contained a variety of organisms intolerant of polluted conditions, mostly gill-breathing immature stages of aquatic flies. As pollution indicators, different organisms must be considered not separately but as biocommunities, i.e., as associated groups with different morphological adaptations and physiological requirements. Several formal systems for biological assessment of pollution from communal compositions have been suggested. A reduction in community diversity has been noted in several rivers polluted by organic wastes. Diversity indices, based on information theory, are highly useful for comparing changes in the community composition of pollution-affected streams. (See also W74-12174) (Brown-IPC)

A TENTATIVE PROPOSAL FOR A RAPID IN-PLANT BIOLOGICAL MONITORING SYSTEM,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.; and Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
J. Cairns, Jr., R. E. Sparks, and W. T. Waller.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 127-147, 10 fig, 4 tab, 4 ref.

Descriptors: *Bioindicators, *Industrial wastes, *Chemical wastes, *Bioassay, *Monitoring, Toxicity, Fish, *Zinc, *Copper, Copper compounds, Laboratory animals, Water pollution effects, Pollutants, Indicators, Lethal limit, Control systems, Ecosystems, Waste water(Pollution), *Pollutant identification.
Identifiers: Sublethal effects, Zinc compounds.

Preliminary tests are reported for a rapid biological monitoring system which measures changes in the movement and breathing of fish as an early warning of developing toxicity in the waste discharges of an industrial factory. The system provides a continuous assessment of toxicity for comples mixtures varying with time. It was laboratory-tested with simulated spills of Cu and Zn. Fish can detect potentially lethal concentrations of Zn (8 mg/liter) rapidly enough to survive if the Zn is removed at the time of its detection, and also detect sublethal concentrations (2-3 mg/liter). (See also W74-12174) (Brown-IPC)
W74-12183

RAPID BIOLOGICAL MONITORING SYSTEM FOR DETERMINING AQUATIC COMMUNITY STRUCTURE IN RECEIVING SYSTEMS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.; and Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
J. Cairns, Jr., K. L. Dickson, and G. Lanza.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 148-163, 5 fig, 28 ref.

Descriptors: *Water pollution, *Water pollution effects, *Monitoring, *Bioassay, Ecosystems, *Control systems, *Data processing, Aquatic life, Pollutant identification, Water management(Applied), Analytical techniques, Streams.
Identifiers: Feedback, Sequential Comparison Index, Lasers, Holography, Saprobic system.

Biological monitoring of pollution provides information not available via conventional physical-chemical methods. The saprobic system and the use of structural and functional changes in aquatic communities are two approaches used in assessing the effects of pollutants on aquatic communities. The feedback of information from conventional biological in-stream monitoring has been too slow for the most effective management of an aquatic system. Two rapid biological monitoring systems have been developed to increase the speed of data collection and analysis, viz., the Sequential Comparison Index, and an automated community structure analysis using laser holography. These systems are described as illustrated. (See also W74-12174) (Brown-IPC)
W74-12184

USE OF TOXICITY TESTS WITH FISH IN WATER POLLUTION CONTROL,
Newtown Fish Toxicology Lab. National Water Quality Lab., Cincinnati, Ohio.
C. E. Stephan, and D. I. Mount.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 164-177, 14 ref.

Descriptors: *Bioassay, *Toxicity, Fish, *Water pollution control, *Water pollution effects, *Testing procedures, Lethal limit, Fish populations, Fish behavior, Fish physiology, Pathology, Toxins, Pollutants, Fish conservation, Fish toxins, Taste, Aquatic animals, *Pollutant identification.
Identifiers: Sublethal effects.

The three major functions of applied fish toxicology in water pollution control programs include: (1) to make the best possible decisions regarding the effects of pollution on fish, based on existing data; (2) to make available the additional data most needed for the protection of important fish species; and (3) to evaluate the usefulness of specific toxicity tests and ways of using them to fulfill identified needs and to suggest improved or new tests to be developed. The acute mortality test provides data that are useful in some situations. However, the chronic test (which studies the effects of a toxicant on survival, growth, and reproduction) is probably the most useful test for estimating long-term safe concentrations. Other important adverse effects that should be studied include avoidance, flavor impairment, and accumulation of toxic residues. (See also W74-12174) (Brown-IPC)
W74-12185

ASSESSMENT OF FISH FLESH TAINTING SUBSTANCES,
Environmental Protection Agency, Grosse Ile, Mich. Grosse Ile Lab.
N. A. Thomas.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 178-193, 2 fig, 2 tab, 26 ref.

Descriptors: Fish, *Taste, Fish diets, *Organoleptic properties, *Pollutant identification, *Water pollution effects, Effluents, *Industrial wastes, *Municipal wastes, Discharge(Water), *Ohio River, Ohio, United States, Nutrients, Foods, Testing procedures, Aquatic animals, Fishing, Rivers, Lakes, *Channel catfish.
Identifiers: Sublethal effects.

Increased use of lakes and rivers for sport and commerical fishing in the vicinity of large municipal and industrial effluent discharges has led to the realization that fish in many bodies of water are not palatable. The discharge of organic compounds has contaminated fish flesh to the extent that fishing is curtailed more because of poor eating quality than lack of fish populations. The magnitude of fish flesh tainting was studied, using channel catfish (Ictalurus punctatus Rafinesque) caught in the Ohio River from Pittsburgh, Pa., to Cairo, Ill. An organoleptic panell of fish tasters could differentiate between fish held upstream and downstream from a waste water discharge. Caged fish exposed for 3 days acquired a minimum of 70% of the off-flavor of native fish. (See also W74-12174) (Brown-IPC)
W74-12186

USE OF HISTOLOGIC AND HISTOCHEMICAL ASSESSMENTS IN THE PROGNOSIS OF THE EFFECTS OF AQUATIC POLLUTANTS,
Louisville Univ., Kentucky. School of Medicine.
D. E. Hinton, M. W. Kendall, and B. B. Silver.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 194-208, 23 fig, 30 ref.

Descriptors: Water pollution effects, Water quality, *Toxicity, Fish toxins, *Mercury, *Enzymes, *Bioassay, *Bioinidicators, Animal pathology, Pathology, Biology, Catfishes, *Channel catfish, Fish, Aquatic animals, Heavy metals, Microscopy, Electron microscopy, Analytical techniques, Testing procedures, Monitoring, Pollutants, Fish physiology, *Pollutant identification.
Identifiers: Histology, Histochemistry, Tissues, Sample preparation, Prognosis, *Methyl mercury chloride.

The effects of water pollutants on fish tissues can be evaluated and predicted by histologic and histochemical techniques. These techniques are reviewed and discussed, including sample preparation. Definitions of terms are included. The methodologies involved are illustrated by summarizing studies on the effect of methyl mercury chloride on channel catfish. Alterations in tissue structure and enzyme activity are evident as a result of exposure to low concentrations of heavy metal pollutants. Early alteration in response to aquatic toxins is detectable by electron microscopy in conjunction with enzyme histochemical analyses. The extent of alteration forms the basis for prognoses and thus for the development of reasonable water quality standards. (See also W74-12174) (Brown-IPC)
W74-12187

STABILIZATION OXYGEN DEMAND,
Weston and Stack, Inc., Malvern, Pa.
V. T. Stack, Jr.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 209-220, 7 fig, 3 ref.

Descriptors: *Biochemical oxygen demand, *Oxygen demand, *Bioassay, *Biodegradation, *Organic compounds, Water pollution, *Analytical techniques, *Testing procedures, Organic loading, *Pollutant identification, Microorganisms, Aquatic microorganisms, Standards, Chemical reactions.
Identifiers: Stabilization oxygen demand, Biosynthesis.

The oxygen required for biological stabilization of organic matter is a fundamental parameter in assaying the presence of such biodegradable materials. Comparative results present the status of biological stabilization reactions in natural systems and biological processes. The 5-day BOD test has been used as a limited measurement of the desired data. A stabilization oxygen demand (SOD) technique for more definitive examination of bio-stabilization is being developed by a task force of ASTM Committee D-19 on Water. The analytical technique is based on measurements of energy oxygen utilized in support of synthesis reactions and of the resulting synthesis of microorganisms. Completion of analysis in ca. 1 hr is an objective. The SOD is calculated as the sum of energy oxygen and autoxidation oxygen utilized in the stabilization of synthesized cell material. The synthesis may conceivably be measured by determining changes in ATP (adenosine triphosphate) concentrations. (See also W74-12174) (Brown-IPC)
W74-12188

MICROBIOLOGICAL INHIBITION TESTING PROCEDURE,
Weston (Roy F.), Inc., West Chester, Pa.
P. J. Marks.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 221-226, 2 fig, 1 tab, 2 ref.

Descriptors: *Inhibition, *Microorganisms, Activated sludge, Water pollution effects, *Testing procedures, Analytical techniques, Pollutants, Waste Water(Pollution), *Bioassay, *Waste water treatment, *Biological treatment, Biochemical oxygen demand, Biodegradation, Effluents, Industrial wastes, Inhibitors, Oxidation, Monitoring, Biomass, Metabolism, *Pollutant identification.
Identifiers: Microbiological Inhibition Testing Procedure.

A procedure for determining the potential adverse effects of specific compounds or waste waters on biological treatment processes is described. It involves the monitoring of the oxidation rate of a biological seed at various waste water dilutions in BOD bottles. The threshold inhibition level of a compound or specific effluent is defined as the lowest concentration which causes a reduction in the biological oxidation rate. (See also W74-12174) (Brown-IPC)
W74-12189

USE OF ARTIFICIAL SUBSTRATE SAMPLERS TO ASSESS WATER POLLUTION,
T. W. Beak, T. C. Griffing, and A. G. Appleby.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 227-241, 6 fig, 35 ref.

Descriptors: *Sampling, *Monitoring, Equipment, Benthic flora, Benthic fauna, Water pollution effects, *Artificial substrates, *Bioassay, Periphyton, Invertebrates, Aquatic organisms, Marine biology, Benthos, Marine animals, Marine plants, *Pollutant identification.

Benthic organisms (macro-invertebrates and micro- and macrophytic floral species) are important parts of aquatic ecosystems for measuring the impact of pollution. Artificial substrate samplers provide a means of sampling many locations where other samplers are ineffective. Their historic development and use, and the major types of available apparatus are discussed. Three macroinvertebrate samplers (the rock-filled basket, the multi-plate sampler, and the Beak steel tray) are evaluated critically and compared to results obtained using other methods (Surber sampler, dip net, and Petersen grab). Periphyton samplers usually consist of glass or plastic plates, with differing methods of suspension. Marine intertidal and subtidal communities may be sampled by fiberglass plates bolted to rocks or building blocks. Artificial substrate samplers can obtain an equally diverse fauna with less variability between samples. They are an effective method of biological monitoring and evaluation of water pollution. (See also W74-12174) (Brown-IPC)
W74-12190

MOBILE BIOASSAY LABORATORIES,
Industrial Bio-Test Labs., Inc., Northbrook, Ill.
R. M. Gerhold.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 242-256, 1 tab, 34 ref.

Descriptors: Equipment, *Laboratories, Research facilities, *Bioassay, *Water quality control, *Monitoring, Research and development, Facilities, Measurement, Pollution abatement, Water pollution effects, Aquatic organisms, Sampling, Organizations, Institutions, Organoleptic properties, Toxicity, Pollutants, Water quality standards, Regulation, Water pollution control, Analytical techniques, Testing procedures, Boats, Barges, Tracking techniques.
Identifiers: *Mobile laboratories, Directories, Trailers, Carts, Automotive equipment, Vehicles, Locomotive equipment.

Mobile laboratories with flow-through systems utilize actual receiving waters with their unique physical, chemical, and biological characteristics which are known to influence the toxicity of environmental contaminants. They offer definite advantages over stationary laboratories in collection of data for enforcement of water quality standards, for pest control studies, and for pollution engineering and research. They can also be used to investigate the tainting of edible aquatic organisms by organoleptic methods. A survey of mobile bioassay equipment and a list of organizations using them are provided. The table indicates the

facilities (tractor trailer, house trailer, hospital cart, van, barge, houseboat, two-wheel trailer, self-propelled cab, etc.), the kind of studies performed, the organisms studied, and persons to be contacted for further information. Increasing use for such mobile bioassay laboratories is both recommended and predicted in applied research on pollution monitoring and abatement. Semi-permanent streamside or floating laboratories can also help to gain fundamental knowledge on environmental factors affecting the growth, development, reproduction, and behavior of aquatic organisms which is needed for better understanding of long-term pollution effects. (See also W74-12174) (Brown-IPC)
W74-12191

DETERMINATION OF TRACE METAL POLLUTANTS IN WATER RESOURCES AND STREAM SEDIMENTS,
Dayton Univ., Ohio.
C. R. Cothern.
Available from the National Technical Information Service as PB-235 855 $5.50 in paper copy, $2.25 in microfiche. Ohio Water Resources Center, Columbus, Completion Report 424X, 1974. 182p, 2 append. OWRT B-044-OHIO(1).

Descriptors: *Analytical techniques, *Chemical analysis, Lake Sediments, Radioactive tracers, Organic compounds, *X-ray fluorence, *Trace elements, Surface waters, Plant physiology, *Pollutant identification, *Lake Erie, *Ohio, *Metals, Absorption, *Electron microscopy, *Calibrations, Zinc, Strontium, Cadnium.
Identifiers: Dayton(Ohio), *Great Miami River(Ohio).

Studies were conducted concerning development of the technique of X-ray fluorescence (XRF) and electron spectroscopy for chemical analysis (ESCA) for trace metal analysis. Four independent techniques for quantitatively calibrating an XRF spectrometer were compared showing the most reliable to be the semi-theoretical method. The minimum detectability limit for bremsstrahlung excitation was shown to be of the order of 10 ppm. A new method of peak spectra analysis was developed. It was shown that the K alpha/K beta ratio was constant for normal environmental samples. Also interelement effects were shown to be small for environmental samples. Electron excitation was shown to be a poor alternative to proton excitation. The technique of XRF was used to determine trace element concentration in Lake Erie sediments and water samples from the Great Miami River. This latter study revealed the importance of determining both the dissolved and suspended loads. A method was developed for energy calibrating an ESCA spectrometer for environmental samples. This method was applied to several zinc compounds and used to identify molecular species in sediments. It was shown that ESCA can be applied to both inorganic and organic environmental samples. An approach was developed to calculate the charge on an atom allowing systematic analysis of ESCA spectra. A radioactive isotope tracer technique was used to determine the uptake of Zn, Sr and Cd in buckwheat plants. This study showed synergistic effects between these elements.
W74-12194

EFFECTS OF CADMIUM SALTS ON THE REPRODUCTIVE POTENTIAL OF MALE RAINBOW TROUT AS DETERMINED BY IN-VIVO AND INVITRO TECHNIQUES,
Oklahoma State Univ., Stillwater. Dept. of Zoology.
W. C. Sanford.
Available from National Technical Information Service, Springfield, Va 22161 as PB-235 837 $3.00 in paper copy; $2.25 in microfiche. Oklahoma Water Resources Research Institute, Stillwater Completion Report, (1974). 16 p, 10 fig, 1 tab, 13 ref. OWRT A-042-OKLA(1), 14-31-0001-4036.

Descriptors: *Ultrasonics, *Cultures, *Rainbow trout, Cadmium, Chlorides, Gonads, *Fish reproduction, Growth rates, *Cytological studies, Pollutant identification, Water pollution effects.
Identifiers: *Trypsin, *EDTA, Liebovitz L-15, Adhesive cells, *Cadmium salts.

A new method for dispersing strongly adhesive cells which uses trypsin and EDTA and ultrasonic sound at non-destructive levels, has been applied to cultures of rainbow trout gonad (RTG-2) cells and has yielded monodisperse cells. Cells dispersed with combined chemical and sonic treatment exhibited the same settling and adhesion times as those transferred without ultrasonic treatment. As measured by trypan blue dye exclusion, viability of cells after this isolation technique was 93%. This new method allows 100% recovery of cells from dense cultures, yields monodisperse cells in suspension, and reduces trypsin contact time. Cadmium chloride was added to Liebovitz L-15 medium to give concentrations of 0, 1, 5 and 10 mg CdCl2/1 to determine the effect of Cd on the growth rate and morphology of Rainbow Trout gonad cells. One mg CdCl2/1 had very little effect on the cells with growth rates and morphology equivalent to control cells lacking CdCl2. After 6 days contact with 5 mg CdCl2/1, a depression in growth rate below control levels was observed as well as a morphologic change in cells characterized by decreased substrate adhesion and the formation of thin granular cellular projections. At 10 mg CdCl2/1 a rapid loss of cells occurred with a loss of cellular integrity.

PROCEEDINGS, SYMPOSIUM ON CONTROL OF FINE PARTICULATE EMISSIONS FROM INDUSTRIAL SOURCES.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 829, $13.00 in paper copy; $2.25 in microfiche. Held January 15-18, 1974, San Francisco, California, Sponsored by US/USSR Working Group, Stationary Source Air Pollution Control Technology. Environmental Protection Agency, Report EPA-600/2-74-008, (1974), 775 p.

Descriptors: *Air pollution, *Control, Technology, *Particle size, Particle shape, *Measurement, Filters, *Industrial wastes, *Conferences, Instrumentation, Coagulation, Condensation, *Pollutant identification, Electrophoresis, Waste treatment.
Identifiers: Fabric filters, *Fine particulates, Electrostatic precipitators, Wet scrubbers, Sonic agglomeration, Emissions, Air pollution sources.

Proceedings of the symposium contain papers from US and USSR on the application of conventional technologies for control of fine particles (3 microns and less), new concepts for fine particulate control, advances in measurement techniques, and chemical composition of fine particulates. The theory behind and the application of electrostatic precipitators, wet scrubbers, and fabric filters for removal of fine particulates from stationary sources are covered. New concepts covered include sonic agglomeration, electrically induced agglomeration, coagulation and condensation with utilization of electrophoresis, thermophoresis, and diffissiophoresis. The presently applied particulate mass measurement methods, plume opacity measurement, instruments measuring efficiency of particulate control equipmnet, sampling from high-temperature, reactive, and corrosive gases, measurement of particle size distribution at emission sources are covered in papers on measurement techniques. COMPARISON OF GERMANIUM DETECTORS FOR NEUTRON ACTIVATION ANALYSIS FOR MERCURY,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
R. V. Moore, and O. W. Propheter.
Copy Available from GPO Sup Doc as EP1.23:660/2-74-045, $0.55; microfiche from NTIS, Springfield, Va 22161 as PB-235 944 $2.25. Environmental Protection Agency, Technology Series, Report EPA-660/2-74-045, June 1974. 12 p, 3 tab, 2 ref. EPA Project 16ADN 42, Program Element 1BA027.

Descriptors: *Neutron activation analysis, *Mercury, Analytical techniques, *Pollutant identification, Chemical analysis.
Identifiers: *Gamma ray detectors, *Germanium detectors, Low energy photon detectors.

Two types of lithium-drifted, solid-state, germanium detectors were compared for their ability to detect and measure mercury in matrices of different complexity. Compared were (1) a large, coaxial detector with relatively high efficiency and a good peak-to-Compton ratio, and (2) a thin wafer detector, called alow energy photon detector (LEPD), which has a good resolution for low energy photons. In samples with relatively few elements primarily of low atomic number, the large detector is preferred because of its greater counting efficiency. In complex samples containing many elements that interfere with the mercury peak, e.g., samarium, thorium, barium, and tungsten, the detector of choice is the LEPD because of its ability to resolve the gamma photons. The choice of detector for intermediate samples would depend on the quantity of interfering elements present. (EPA)

SORPTION OF ORTHOPHOSPHATE ON THE SURFACE OF WATER SAMPLE CONTAINERS,
Agricultural Research Service, Morris, Minn.
J. J. Latterell, D. R. Timmons, R. F. Holt, and E. M. Sherstad.
Water Resources Research, Vol 10, No 4, p 865-869, August 1974. 6 tab, 3 ref.

Descriptors: *Sorption, *Adsorption, *Phosphates, *Phosphorus, Chemical analysis, Phosphorus compounds, Inorganic compounds, Surfaces, Anion adsorption, Phosphorous radioisotopes, Analytical techniques, Spectrophotometry, *Pollutant identification.
Identifiers: *Orthophosphate, Ascorbic acid method, Borosilicate glass containers, Polyethylene containers, Coated galvanized metals, Uncoated galvanized metals, Desorption, Cubitainer, Plicote, Contact time, Radioactive 32P.

Orthophosphate sorption studies on borosilicate glass, polyethylene, and coated and uncoated galvanized metal were reported. The concentration range of orthophosphate in the solutions studied was 0.0075-1.00 ppm P, and the pH range was 5.8-8.8. The exposure of solution to surface ranged up to 14 days, ratios of surface area to milliliters of solution being in the range 0.04-1.14 sq cm/m.l. The percent of the original orthophosphate sorbed was determined by the use of radioactive 32P and by orthophosphate analysis using the ascorbic acid method. Studies indicated that aqueous solutions containing 0.03-0.112 ppm orthophosphate may be stored in either borosilicate or polyethylene bottles with less than 0.5% adsorption during the initial 24-hour storage period. The amount of sorption for a given sample was observed to increase as the contact time and/or the ratio of surface area to solution volume increased. Measurable quantities of orthophosphate were sorbed on galvanized sheet metal in all the studies made, indicating that sample-collecting equipment made of this material should be coated to minimize orthophosphate sorption. Various coatings were tested, and their effectiveness was minimizing sorption is reported. (Henley-ISWS)

DATA ON SELECTED LAKES IN WASHINGTON, PART II,
Geological Survey, Tacoma, Wash.
G. C. Bortleson, G. T. Higgins, and G. W. Hill.
Available from Washington State Dept. of Ecology, Olympia, Price $3.00 per copy. Washington State Department of Ecology, Olympia, Water-Supply Bulletin 42, June 1974. 145 p, 69 fig, 7 tab, 52 ref, append.

Descriptors: *Lakes, *Washington, *Limnology, Eutrophication, *Surveys, *Data collections, *Hydrologic data, Nutrients, Algae, Thermal stratification, Dissolved oxygen.

Twenty-three lakes in Washington were investigated to determine their present trophic status and evaluate their potential for nutrient enrichment from cultural and natural sources. The lake basins vary from relatively undisturbed forest land to urban and suburban land, with lakeshore homes numbering from none to more than 50 homes per mile of shoreline. The mean depth--probably the most significant morphometric parameter affecting lake productivity--was rather shallow (12-25 ft) in about two-thirds of the lakes investigated. The midsummer dissolved-oxygen profiles of most lakes show saturation or slight supersaturation in the epilimnion, and low oxygen content (often depleted) in the hypolimnion. The observed specific-conductance values during winter mixing ranged from 10 to 145 micromhos per centimeter. The specific conductance for about 40% of the lakes was fairly low (10-50 micromhos per centimeter). The mean total phosphorus concentration in the photic zone throughout the year ranged from 3 to 108 micrograms per liter; the median value was 16 micrograms per liter. The mean inorganic nitrogen (ammonia plus nitrate) concentration in the photic zone throughout the year ranged from 50 to 980 micrograms per liter; the median value was 180 micrograms per liter. Algal blooms were observed at least once on 9 lakes; persistent algal blooms were observed on 3 lakes. The bottom area occupied by submergent rooted aquatic plants ranged from 0.2% to 34% of the total bottom area, and the water surface occupied by emergent and (or) floating rotted aquatic plants ranged from less than 0.01% to 9.4% of the lake surface area. The lakes with the more abundant macrophyte growth contained a higher percentage of muck in the littoral zone, while lakes with less abundant macrophyte growth contained a higher percentage of coarse sand, gravel and cobbles in the littoral zone. FREEZE CONCENTRATION OF TOXIC POLLUTANTS FOR BIOASSAY,
Oregon State Univ., Corvallis. Water Resources Research Inst.
F. D. Schaumburg.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 911, $3.25 in paper copy, $2.25 in microfiche. Completion Report, July 1974. 24 p, 1 fig, 1 tab, 19 ref. OWRT A-018-ORE(1).

Descriptors: Chlorides, *Dieldrin, *Bioassay, Freezing, Toxicity, Toxins, Pulp wastes, Chemical analysis, *Pollutant identification, Water pollution effects.
Identifiers: *Methylmercuric chloride, *Freeze concentration process.

A freeze concentration process was investigated as a possible method whereby sub-lethal concentrations of toxic substances in aqueous solution could be quantitatively concentrated for analysis by standard acute toxicity tests. Excellent chemical recoveries were obtained for a sodium chloride control sample; however, two toxic substances, methylmercuric chloride and dieldrin were not concentrated quantitatively. A dilute sample of kraft pulp mill effluent was also freeze-concentrated and evaluated by chemical analysis. Bioassays using newborn guppies were undertaken on unconcentrated and freeze-concentrated solutions of dieldrin. These experiments revealed that the freezing process did not alter the toxic nature of the compound. In general, the results showed that the freeze concentration method is not a feasible approach for concentrating dilute samples for acute toxicity analysis.

ATOMIC ABSORPTION DETERMINATION OF NANOGRAM QUANTITIES OF ARSENIC IN BIOLOGICAL MEDIA,
Washington Univ., Seattle. Dept. of Environmental Health.
R. M. Orheim, and H. H. Bovee.
Analytical Chemistry, Vol 46, No 7, p 921-922, June, 1974. 4 fig, 1 tab, 13 ref.

Descriptors: *Arsenic, *Spectroscopy, *Analytical techniques, *Organic matter, Laboratory tests, Testing procedures, Instrumentation, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy.

An improved method is described for the preparation of organic samples and a sensitive procedure for arsenic analysis using a single-beam atomic absorption spectrophotometer. An arsine generator and collection train was assembled from standard laboratory glassware. The sample was digested with HCl, KI, $SnCl_2$, and zinc and arsenic generated was trapped in tubing immersed in liquid nitrogen. Aqueous standards containing 0 to 500 ng of arsenic were analyzed by the arsine generation procedure. The precision of nine replicate runs of 100 ng of arsenic was within 5%. Quantitative recovery of namogram amounts of added arsenic from whole blood has been demonstrated with accuracy varying from 95 to 105%. The single beam atomic absorption spectrometric procedure is essentially linear to 100 ng of arsenic with a useable curve to 500 ng. (Jernigan-Vanderbilt)

ANALYSIS OF BACKGROUND COPPER CONCENTRATION IN SEAWATER BY ELECTRON SPIN RESONANCE,
Kansas State Highway Commission, Topeka. Planning and Development Dept.
Y. P. Virmani, and E. J. Zeller.
Analytical Chemistry, Vol 46, No 2, p 324-325, February, 1974. 2 fig, 11 ref.

Descriptors: *Copper, *Sea water, *Analytical techniques, Testing procedures, Separation techniques, Solvents, *Pollutant identification.
Identifiers: *Electron spin resonance.

A technique was tested which makes possible the rapid analysis of the copper concentration in seawater in ranges as low as 0.1 ppb. The system makes use of Electron Spin Resonance (ESR) combined with concentration enhancement by chelation and solvent extraction. Copper can be observed as ESR in the aqueous phase. A concentration of 0.1% 8-hydroxyquinoline was tested in various organic solvents such as ethyl propionate, 3-propanone, ethyl acetate, butyl ether, methyl isobutyl ketone, and cyclophexene. Ethyl propionate was the most satisfactory solvent for the seawater extractions. A plot of samples of seawater spiked with copper indicates a background value of 2.6 ppb Cu in the seawater. The total error of plus or minus 0.2 ppb arose from error in the spectrometer itself and error in the extraction system. (Jernigan-Vanderbilt)

OCCUPATIONAL EXPOSURE TO INORGANIC COMPOUNDS OF LEAD,
Institute of Occupational Health, Zabrze (Poland). Dept. of Industrial Toxicology.
H. Urbanowicz.
Archives of Environmental Health, Vol 23, No 4, p 286-288, October, 1971. 1 fig, 3 tab, 12 ref.

Descriptors: *Inorganic compounds, *Urine, Lead, Human physiology, Distribution, Analytical techniques, Average, *Industrial wastes, Correlation analysis, Adaptation, Lethal limit, *Air pollution effects.

Identifiers: Sub-lethal effects.

A group, initially of 60 persons, was subjected to mild occupational exposure to lead during a period of two years' work in a new smelter. These men, under medical surveillance in an area in which the concentrations of lead in the air were determined at multiple sites on a bimonthly schedule, provided specimens of urine, also bimonthly, at the end of four hours of work on a morning shift. Urine was analyzed for content of lead, delta-aminolevulinic acid, and coproporphyrin. The data, are not sufficiently revealing to provide suitable criteria for the appraisal of the severity of the exposure in relation to the danger of its continuance. (Rowe-Vanderbilt)

DETERMINATION OF ZINC AND NICKEL BY CHARGED PARTICLE ACTIVATION ANALYSIS,
Texas A and M Univ., College Station. Dept. of Chemistry.
D. L. Swindle, and E. A. Schweikert.
Analytical Chemistry, Vol 45, No 12, p 2111-2115, October, 1973. 4 fig, 4 tab, 21 ref. NSF (GP-34877X).

Descriptors: *Zinc, *Nickel, *Analytical techniques, Chemical reactions, Heavy metals, Copper, Cobalt, *Testing procedures, Irradiation, Trace elements.
Identifiers: *Activation analysis.

Procedures for the sub-ppm determination of zinc and nickel have been developed using charged particle activation analysis. Reactions with protons, deuterons, helium-3, and helium-4 beams on thick Zn and Ni targets have been investigated. The most favorable reactions for Zn and Ni analysis were the Zn-66(p,n)Ga-66 and the Ni-58(p,pn)Ni-57 reactions, respectively. A series of samples was analyzed with zinc or nickel contents ranging from 500 to less than 1 ppm, utilizing a post-irradiation chemical separation of the product nuclides. Results from thick target experiments indicate that both Zn and Ni determinations can be made at the ppb level. Activation curves (relative excitation functions) for the reactions used for analysis, as well as possible interfering reactions, are presented and discussed. (Jernigan-Vanderbilt)
W74-12484

DETERMINATION OF MERCURY AND SELENIUM IN COAL BY NEUTRON ACTIVATION ANALYSIS,
North Carolina State Univ., Raleigh. Dept. of Nuclear Engineering.
J. N. Weaver.
Analytical Chemistry, Vol 45, No 11, p 1950-1952, September, 1973. 4 fig, 1 tab, 6 ref.

Descriptors: *Mercury, *Selenium, *Coal, *Analytical techniques, *Neutron activation analysis, X-rays, Research and development, Trace elements, Heavy metals, Tracers, Testing procedures, Equipment.

The procedure described was an optimization of the technique of neutron activation analysis (NAA) and the utilization of a newly developed nuclear detector known as the Low Energy Photon Detector (LEPD). Although originally intended for charged particle analysis, research has shown (LEPD) to be quite promising as a partner with instrumental NAA based on X-ray identification of certain trace metals in irradiated materials. The identification of mercury was especially attractive because of the high cross section for production of the Hg-197 isotope, its 65-hr half-life and the strong intensity of several X-rays and a low energy gamma associated with its decay. Selenium (Se-75), with a 120-day half-life, was easy to identify using two low-energy gamma-rays. The method described for the determination of mercury and selenium in a variety of matrices including coal and fly ash achieves three significant improvements over currently used procedures. The procedure has no chemical manipulations, thereby eliminating technique-related errors. The procedure is based on the direct measurement of the X-rays from irradiated matrices, thus allowing the same technique to be used on a wide variety of matrices. (Jernigan-Vanderbilt)
W74-12485

METALLIC POLLUTANTS MONITORED BY ATOMIC ABSORPTION.
Water and Sewage Works, Vol 119, No 6, p 56-57, June, 1972. 1 tab.

Descriptors: *Heavy metals, Trace elements, Pollutants, *Analytical techniques, *Spectroscopy, Sewage treatment, Monitoring, Copper, Chromium, Calcium, Nickel, Zinc, Lead, Arsenic, Toxicity, Public health, *North Carolina, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy, Charlotte(NC).

The implementation of an atomic absorption monitoring operation in Charlotte, North Carolina to determine the concentrations of heavy metals in the water supply is discussed. Daily analyses of samples taken from three waste treatment plants were used to establish 'normal' levels of copper, chromium, calcium, nickel, zinc, and lead in the sewer system. The program included sampling industrial wastes from about 450 companies issued permits to use the city sewage system. (Jernigan-Vanderbilt)
W74-12486

BERYLLIUM.
Environment, Vol 16, No 3, p 35-36, April, 1974, 2 ref.

Descriptors: *Beryllium, *Toxicity, *Human pathology, Public health, Industrial plants, Metals, Standards, Research priorities, *Air pollution effects, Pollutant identification.
Identifiers: Occupational health.

Beryllium can have both acute and chronic effects. On the acute side it can produce skin ulcers, ocular ulcers, and respiratory tract inflammation, all of which are reversible if exposure is ended in time. The chronic effects of beryllium, frequently separated by years from the time of exposure, usually include pneumonitis with a cough, chest pain and general weakness. Heart, spleen and kidney problems may also appear. The safe exposure level for workers is not known. In 1949, working with a minimum of data, an Atomic Energy Commission panel set the limit of 2 micrograms/cu m of air. Since that time little research has been done and the level remains the same, although it is not and has never been met by industry. Still it has had some effectiveness because since the 1949 AEC standard was instituted, there has been a decline in the incidence of beryllium disease. Research is now oriented toward discovering a possible immunological basis of beryllium disease, which would indicate that some people are much more susceptible than others and showing evidence of beryllium's carcinogenicity. (Jernigan-Vanderbilt)
W74-12487

TRACE METALS IN ASBESTOS CARCINOGENESIS,
Wayne State Univ., Detroit, Mich. Dept. of Occupational and Environmental Health.
A. K. Roy-Chowdhury, T. F. Mooney, Jr., and A. L. Reeves.
Archives of Environmental Health, Vol 26, No 5, p 253-255, May, 1973. 5 tab, 14 ref. 2-RO-1-EC-00240-6.

Descriptors: *Metals, *Asbestos, *Analytical techniques, Spectroscopy, Methodology, Laboratory tests, Public health, Industrial wastes, *Trace elements, *Pollutant identification, *Air pollution.
Identifiers: Carcinogenic.

Concentrations of trace metals judged potentially carcinogenic were determined in samples of amosite, crocidolite, and chrysotile. The samples included commercial material as shipped, milled and processed material as collected in animal exposure chambers, and International Union Against Cancer (UICC) reference samples. The metals determined were cobalt, nickel, chromium, manganese, and iron. The samples were treated with hydrofluoric acid, the residue taken up with hydrochloric acid, and the determination made by atomic absorption spectrometry. Substantial enrichment of the dusts in nickel and chromium during milling and dissemination was found. Cobalt and nickel content was different from that in UICC samples. (Rowe-Vanderbilt)
W74-12488

RESPONSE OF CYANIDE ION SELECTIVE MEMBRANE ELECTRODES IN THE PRESENCE OF METAL IONS,
Rome Univ., (Italy). Instituto di Chemica Analitica.
M. Mascini, and A. Napoli.
Analytical Chemistry, Vol 46, No 3, p 447-449, March, 1974. 4 fig, 9 ref.

Descriptors: Measurement, *Cyanide, *Metals, Chemical reactions, *Analytical techniques, Testing procedures, Cadmium, Zinc, Nickel, Aqueous solutions, *Ions, *Pollutant identification.

The presence of cations was studied and general equations were derived, taking into account the influence of any cyanide complexes on the response of selective membrane electrodes. The measurements were carried out by using iodide, bromide, and chloride electrodes Sens-ion AMEL, made of a heterogenous membrane of silver halide and polythene molded to a polythene; the reference electrode was a double junction SCE filled with KN03 M. The solutions of the metal ions were added to the cyanide solutions. The value of pH was measured with a glass electrode and was regulated between 6 and 8 with NH03 or NaOH. The properties of these electrodes are discussed. (Jernigan-Vanderbilt)
W74-12489

DETERMINATION OF CHROMIUM IN BIOLOGICAL SAMPLES USING CHEMILUMINESCENCE,
Georgia Univ., Athens. Dept. of Chemistry.
R. T. Li, and D. M. Hercules.
Analytical Chemistry, Vol 46, No 7, p 916-919, June, 1974. 2 fig, 6 tab, 21 ref. NIH (GM-17913).

Descriptors: *Chromium, *Analytical techniques, *Organic matter, Chemical reactions, Standards, Testing procedures, Laboratory tests, Human physiology, Spectroscopy, Colorimetry, Distribution, *Pollutant identification.
Identifiers: *Chemiluminescence.

The application of chemiluminescence to the determination of chromium in biological samples as part of a larger program of applying chemiluminescence methods to biological systems was reported. NBS standard reference materials, orchard leaves and bovine liver were used to check the validity of the method. Neither material had a 'certified' value reported for Cr; orchard leaves have an uncertified value of 2.3 ppm. Chromium analyses were done on human serum samples and compared with literature data. Pooled serum samples were analyzed by chemiluminescence, atomic absorption and colorimetric methods to compare the three methods. The three methods showed good agreement generally. The results demonstrated that the chemiluminescence method, based on light emission catalyzed by Cr (III) in the luminol-hydrogen peroxide reaction, is applicable to the analysis of chromium in biological media with greater selectivity and using smaller samples. (Jernigan-Vanderbilt)

X-RAY PHOTOELECTRON SPECTRA OF LEAD OXIDES,
Purdue Univ., Lafayette, Ind. Dept. of Chemistry.
K. S. Kim, T. J. O'Leary, and N. Winograd.
Analytical Chemistry, Vol 45, No 13, p 2214-2218, November, 1973. 3 fig, 1 tab, 29 ref. NAS (GP-37017X) AFOSR (AFOSR-72-2238).

Descriptors: *Lead, *Oxides, *X-ray spectroscopy, *Analytical techniques, Inorganic compounds, Oxygen, Crystals, Electrochemistry, *Pollutant identification.

X-ray photoelectron spectroscopy (ESCA) spectra of seven different lead-oxygen species were examined including adsorbed oxygen on lead, two crystal forms of PbO, Pb304, Pb02, and two forms of adsorbed water on Pb02. The spectrum of Pb304 exhibited the behavior of two PbO molecules and one PbO2 molecule although specific characterization of the crystal structure of PbO in Pb304 could not be made. The binding energies of the Pb 4f electrons in Pb02 were found to be lower than those of the Pb 4f electrons in PbO. The apparent reversal was rationalized in terms of a relaxation effect. Two kinds of adsorbed water were also found on PbO2. These were explained in terms of a surface adsorbed water species and a water or hydroxyl species which occupied lattice vacancies near the surface. These spectra were then used to characterize electrochemically generated PbO2. (Jernigan-Vanderbilt)
W74-12498

ELECTRON SPECTROSCOPY (ESCA): USE FOR TRACE ANALYSIS,
Georgia Univ., Athens. Dept. of Chemistry.
D. M. Hercules, L. E. Cox, S. Onisick, G. D. Nichols, and J. C. Carver.
Analytical Chemistry, Vol 45, No 11, p 1973-1975, September, 1973. 2 fig, 12 ref. NSF (GP-32484).

Descriptors: *Spectroscopy, *Trace elements, *Analytical techniques, Heavy metals, Laboratory tests, Testing procedures, Filters, *Pollutant identification.
Identifiers: *Electron spectroscopy.

Glass surfaces coated with the dithiocarbamate group were used to analyze for trace quantities of heavy metals. This type of surface was produced by treating glass fiber with an amino functional silylizing reagent and subsequently with carbon disulfide and sodium hydroxide to form the dithiocarbomate which is capable of reacting with heavy metals as a chelating agent. Application of various chelating functional groups to glass fiber surfaces can be accomplished by conventional synthetic organic techniques once the initial silylising function has been attached. Electron spectroscopy sensitivities are comparable for most elements. Therefore, combining the scope of conventional chelate chemistry, the ease of synthesis of chelating functional groups and the wide applicability of ESCA as a measuring device, the electron spectroscopy-glass fiber disk technique appears to be one of very general utility. (Jernigan-Vanderbilt)
W74-12499

DETERMINATION OF TRACE ELEMENTS IN COAL, FLY ASH, FUEL OIL, AND GASOLINE-A PRELIMINARY COMPARISON OF SELECTED ANALYTICAL TECHNIQUES,
National Environmental Research Center, Research Triangle Park, N.C. Quality Assurance and Environmental Monitoring Lab.
D. J. Von Lehmden, R. H. Jungers, and R. E. Lee, Jr.
Analytical Chemistry, Vol 46, No 2, p 239-245, February, 1974. 6 tab, 8 ref.

Descriptors: *Analytical techniques, *Trace elements, *Spectroscopy, *Mass spectrometry, Mercury, Beryllium, Lead, Cadmium, Arsenic, Manganese, Chromium, Statistical analysis, *Pollutant identification, *Air pollution.
Identifiers: Laboratory comparisons.

The Environmental Protection Agency has initiated a program to monitor trace elements in fuels and related emissions to the atmosphere. As part of this program, nine laboratories using similar analytical methods were asked to determine the concentration of 28 elements in the same fuel and fly ash matrices. Among the elements investigated were mercury, beryllium, lead, cadmium, arsenic, vanadium, manganese, chromium, and fluorine. The analytical methods used included neutron activation analysis, atomic absorption, spark source mass spectrometry, optical emission spectrometry, anodic stripping voltammetry, and X-ray fluorescence. The results from the inter-laboratory comparison were evaluated to assess the comparability of various methods as applied to these matrices. The wide range in reported concentrations indicates that different sample preparation and analytical techniques can lead to erroneous results and points out the need for developing standard reference materials certified in trace elements which can be used for analytical methods evaluation and quality control. (Jernigan-Vanderbilt)

DETERMINATION OF SOLUBLE CADMIUM, LEAD, SILVER, AND INDIUM IN RAINWATER AND STREAM WATER WITH THE USE OF FLAMELESS ATOMIC ABSORPTION,
Illinois State Water Survey, Urbana.
A. Rattonetti.
Analytical Chemistry, Vol 46, No 6, p 739-742, May, 1974. 2 fig, 4 tab, 12 ref. AEC-1199 and USBR 14-06-D-7197.

Descriptors: Rain water, Streams, *Analytical techniques, *Spectroscopy, *Heavy metals, *Cadmium, *Lead, *Silver, Laboratory tests, Testing procedures, Toxicity, Instrumentation, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy, *Indium.

Using stream water and rainwater, this study found interferences in the direct determination of: (1) the environmentally hazardous metals, cadmium and lead, and (2) silver and indium, metals which are used in meteorological research. How the interferences were eliminated in flameless atomic absorption tests is described. The precision of triplicate determinations was plus or minus 5% when the amount of analyte dispensed on the heater ribbon was ten times the absolute detection limit. Argon purging, temperature for drying the sample and volatilization, solvent extraction and additives to keep ions in solution were investigated to cut down on interferences. (Jernigan-Vanderbilt)

LOSSES OF TRACE CONCENTRATIONS OF CADMIUM FROM AQUEOUS SOLUTION DURING STORAGE IN GLASS CONTAINERS,
Idaho Univ., Moscow. Dept. of Chemistry.
W. G. King, J. M. Rodriguez, and C. M. Wai.
Analytical Chemistry, Vol 46, No 6, p 771-773, May, 1974. 3 fig, 8 ref.

Descriptors: *Cadmium, *Aqueous solutions, Storage, *Adsorption, Pollutants, Tracers, Laboratory tests, Testing procedures, *Trace elements, *Pollutant identification.

This study was undertaken to determine the magnitude of as well as the mechanism for the loss of cadmium from water samples stored in various containers. Losses of cadmium in solutions of different concentration and pH were measured with respect to time. Radioactive Cd-109 (half-life 470 days) was employed as a tracer for this study. Losses of cadmium from aqueous solution during storage appeared to depend upon at least three parameters: container material, pH of solution, and concentration of cadmium. (Jernigan-Vanderbilt)

ATOMIC ABSORPTION PROCEDURE FOR ANALYSIS OF METALS IN ATMOSPHERIC PARTICULATE MATTER,
Arizona Univ., Tucson. Dept. of Chemistry.
L. E. Ranweiler, and J. L. Moyers.
Environmental Science and Technology, Vol 8, No 2, p 152-156, February, 1974. 1 fig, 4 tab, 14 ref.

Descriptors: *Analytical techniques, *Spectroscopy, *Metals, Sampling, Trace elements, *Testing procedures, *Air pollution, Filters, *Pollutant identification.

A procedure has been developed for the multielement analysis of atmospheric particulate matter by atomic absorption spectrometry. Atmospheric particulate samples are collected on polystyrene filters using hi-vol samplers. The filters are dry ashed at 400-425C and the residue is dissolved with a mixture of HF, HCl, and HNO3 in Teflon acid digestion bombs. With the appropriate dilutions and matrix corrections, it is possible quantitatively to measure 22 metals in atmospheric particulate matter. The elements measured by this procedure are Si, Al, Ca, Fe, K, Na, Mg, Pb, Cu, Ti, Zn, Sr, Ni, V, Mn, Cr, Rb, Li, Bi, Co, Cs, and Be. Although it is possible to observe Cd in samples collected and prepared by this technique, it is probable that Cd is partially volatilized during ashing of the sample. Recovery data for the ashing and dissolution of synthetic samples added to the filter material are presented. Data are also presented for the atmospheric concentration of elements in particulate samples analyzed by this procedure. (Jernigan-Vanderbilt)

INDICATOR SPECIES IN THE DESMID STAURASTRUM,
Connecticut Univ., Storrs. Inst. of Water Resources.
F. R. Trainor.

Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 059; $3.00 in paper copy, $2.25 in microfiche. Completion Report, 1974. 10 p, 5 tab. OWRT A-047-CONN(1). OWRR 14-31-0001-3807.

Descriptors: *Bioindicators, Aquatic algae, *Cultures, *Growth rates, Phosphorus, Carbon dioxide, Pollutant identification.
Identifiers: *Staurastrum, *Desmid, *Axenic culture, Defined inorganic medium, Buffers.

A Staurastrum sp. has been cultured for the first time in uni-algal, bacteria-free culture in a defined, low salts, inorganic medium. Carbon dioxide was found to be a limiting factor for the organism's growth in axenic laboratory culture. Glycylglycine (80 mg/100 ml) was found to be an effective buffer, counteracting the acid pH levels created by carbon dioxide bubbling. The lack of sensitivity of Staurastrum growth rates to small changes in phosphate concentration made this organism a poor indicator of the nutrient condition of natural waters. (deLara-Connecticut)

OIL/WATER INTERFACE DETECTOR LABORATORY EVALUATION,
Esso Research and Engineering Co., Florham, N.J.
J. J. Heigl.
Available from NTIS, Springfield, Va 22161 as COM-74-10120, Price $4.00 printed copy; $2.25 microfiche. Final Contract Report EE.11TRM.73, Maritime Administration, 1973. 90 p, 18 fig, 3 tab, 26 ref, 2 append. C-1-35049.

Descriptors: *Pollutant identification, *Oily water, *Instrumentation, *Oil spills, Conductivity, Resistivity, Acoustics, Water pollution, Ships, Pollution abatement.

For measuring oil-in-water in tanker operation, three devices were tested. The devices were based on acoustic attenuation, sonic velocity, and electrical conductivity. None of the devices, as supplied by the manufacturers, could meet the desired performance. The electrical conductivity device was insensitive to changes in oil concentration in the 0 to 1% oil range. The sonic attenuation device gave outputs which increased with oil content in the 0 to 1% range but sensitivity varied widely and it was not possible to get reproducible results. The sonic velocity device was more sensitive but was affected by variations in specific gravity, salinity and impurities and required control of temperature and pressure. (Knapp-USGS)

THE DETERMINATION OF OIL SLICK THICKNESS BY MEANS OF MULTIFREQUENCY PASSIVE MICROWAVE TECHNIQUES,
Naval Research Lab., Washington, D.C.
J. P. Hollinger.
Available from NTIS, Springfield, Va. 22161 as AD-771 376, Price $3.50 printed copy, $2.25 microfiche. Interim Report No 7110-1 to US Coast Guard, June 15, 1973. 68 p, 38 fig, 1 tab, 21 ref. USCG Contract Z-70099-2-21881.

Descriptors: *Oil spills, *Oily water, *Remote sensing, *Microwaves, *Pollutant identification, Radar.

The thickness and volume of sea surface oil spills was studied using multifrequency microwave radiometry. Aircraftborne measurements were made at 19.3 and at 31.0 or 69.8 GHz of eight controlled marine oil spills. The spills consisted of from 200 to 630 gallons of either No. 2 fuel oil or No. 4 or No. 6 crude oil. The microwave measurements of all of the oil spills of each oil type showed very similar results. The slicks always formed an identifiable region with film thicknesses of a millimeter or more and containing the majority of oil which was surrounded by a very much larger and thinner slick which contained very little of the oil. In general the thick region contained more than 90% of the oil in less than 10% of the area of the visible slick. It was always possible to locate and delineate the thick region solely from the microwave observations. The total volume of oil present derived from the microwave measurements was within about 25% of the volume of oil spilled. Microwave radiometry should prove a useful tool in the confinement, control, and clean up of marine oil spills. (Knapp-USGS)

BIOGEOCHEMISTRY OF THE RARE-EARTH ELEMENTS IN AQUATIC MACROPHYTES OF LINSLEY POND, NORTH BRANDFORD, CONNECTICUT,
Pittsburgh Univ., Pa. Dept. of Biology.
U. M. Cowgill.
Geochim Cosmochim Acta. Vol 37, No 10, p 2329-2345. 1973. Illus.

Descriptors: Trace elements, Aquatic plants, Effects, Vegetation effects, Environmental effects, *Connecticut, X rays.
Identifiers: Aluminum, Ceratophyllum-demersum, Cesium, Decodon-verticillatus, Dysprosium, Erbium, Lanthanum, Macrophytes, Nuphar-advena, Nymphaea-odorata, Pontederia-cordata, Potamogeton-crispus, Potamogeton-praelongus, Praseodymium, Rare-earth, Samarium, Spectroscopy, Ytterbium, Yttrium, Neodymium.

Aquatic plants (Nymphaea odorata, Nuphar advena, Potamogeton praelongus, P. crispus, Ceratophyllum demersum, Pontederia cordata, Decodon verticillatus), water, lake mud, soils and rocks from Linsley Pond (Connecticut) were analyzed for all the naturally occurring elements of the periodic table which could be detected by optical and X-ray emission spectroscopy. In the course of this study, it was noted that all the rare earths of even atomic number were detected; of the odd-numbered members of the group only La and Pr were found. The others were presumably present in amounts below detection. These elements relative to their concentration in the soils and rocks of the basin are absorbed by plants, giving an enrichment of about 100-fold relative to Al on a dry weight basis. Samarium is present in excess of Nd in the rooted emergent plants but not in the submerged rooted or rootless ones. There is some suggestion of a fractionation of the rare earths in different parts of the plants. A comparison of the relative accumulation of trace elements with their content in the sediment suggests that Y, La, Ce, Pr, Sm, Dy, Er and Yb may be essential trace elements.--Copyright 1974, Biological Abstracts, Inc.

AUTOMATED GAS CHROMATOGRAPHIC ANALYSIS OF SULFUR POLLUTANTS,
Varian Aerography, Walnut Creek, Calif.
R. E. Pecsar, and C. H. Hartmann.
J Chromatogr Sci. Vol 11, No 9, p 492-502. 1973. Illus.

Descriptors: *California, *Pollutant identification, Analytical techniques, *Flame photometry, Pulp and paper industry, Oil industry, Electric power industry, Fossil fuels, *Gas chromatography, Chromatography, Chemical analysis, *Air pollution, *Sulfur.
Identifiers: *San-Francisco Bay.

The analysis of sulfur-containing pollutants is becoming mandatory in operations such as kraft paper mills, fossil burning power generation and the petrochemical refining industry. Gas chromatography is a versatile tool for accomplishing this analysis in the normal ppb to ppm concentration range. Typically an all-Teflon flow system is employed with detection by flame photometry. Results are presented showing individual component as well as total system optimization. This includes consideration of column technology, detector gas flow rates and electrical operating parameters. The best column fabrication means are discussed with methods for achieving optimum column and detector operation. For the low level analysis of sulfur pollutants the importance of design attention to the entire system is stressed. The practical application of all these considerations is demonstrated with monitoring data obtained on industrial stationary sources in the San Francisco Bay Area. An analyzer embodying the desired characteristics can be mated with an automated sequence programmer to provide continuous analysis and intermittent calibration completely unattended.--Copyright 1974, Biological Abstracts, Inc.

COXSACKIEVIRUS B EPIDEMIC AT A BOYS' SUMMER CAMP: ISOLATION OF VIRUS FROM SWIMMING WATER,
Vermont Univ., Burlington.
H. B. Hawley, D. P. Morin, M. E. Geraghty, J. Tomkow, and C. A. Phillips.
Jama J Am Med Assoc. Vol 226, No 1, p 33-36. 1973. Illus.

Descriptors: Lakes, Water sports, *Recreation facilities, Camping, *Viruses, Diseases, Swimming, *Vermont.
Identifiers: *Lake Champlain, Coxsackievirus, Enteroviruses, Picornavirus, Polyelectrolyte 60.

During an outbreak of coxsackievirus B5 at a boys' summer camp located on Lake Champlain,

virus was successfully isolated for the 1st time from a large body of recreational water. This was accomplished by using polyelectrolyte 60 to concentrate the virus. Polyelectrolyte 60 was also used in the isolation of viruses from clinical specimens obtained from campers and staff who had a wide variety of clinical syndromes. Virus present in lake swimming water may play in important role in some enterovirus outbreaks.--Copyright 1974, Biological Abstracts, Inc.

APPLICATION OF THE FISSION-TRACK TECHNIQUE TO THE DETERMINATION OF URANIUM IN NATURAL WATERS,
Kyushu Univ., Fukuoka (Japan). Dept. of Chemistry.
T. Takebayashi, H. Matsuda, and S. Umemoto.
Talanta. Vol 20, No 9, p 892-895. 1973.

Descriptors: *Analytical techniques, *Uranium radioisotopes, *Radiochemical analysis, Evaporation, Rivers, *Natural streams, *Pollutant identification.
Identifiers: Fission-track analysis, *Japan, Uranium.

A procedure for the determination of the U content of natural waters is presented. To 100 ml of natural water, 200 ml of concentrated HCl are added and this solution passed through a 6-ml column of Dowex 1-X8. The U is eluted with 60 ml of 0.1 M HCl and the eluate is evaporated to dryness. The residue is subjected to the fission-track technique described previously. The U content of the river waters in Fukuoka City, Japan was determined.--Copyright 1974, Biological Abstracts, Inc.

CLASSIFICATION AND COMMUNITY STRUCTURE OF MACROBENTHOS IN THE HAMPTON ROADS AREA, VIRGINIA,
Virginia Inst. of Marine Science, Gloucester Point.
D. F. Boesch.
Mar Biol (Berl). Vol 21, No 3, p 226-244, 1973. Illus.

Descriptors: *Benthos, *Virginia, *Aquatic plants, Benthic fauna, Water pollution, Mud, Sands, *Classification.
Identifiers: Macrobenthus.

Benthic macrofauna was sampled by grab at 16 stations in Hampton Roads and the adjacent Elizabeth River, Virginia, USA. Samples were taken in Feb., May and Aug. Sampling sizes and species were grouped by a classification strategy which basically consisted of the Canberra metric dissimilarity measure and flexible and group average clustering. Following reallocations, 8 site groups and 16 spp. groups instructively classified the 47 sites and 93 spp. considered in the analysis. The sites were grouped into 'associations' on mud, muddy-sand and sand-bottoms and those in the Elizabeth River. Species groupings distinguished a few species most frequent at Elizabeth River or mud and muddy-sand sites, larger numbers of species restricted to muddy-sand and sand or solely to sand sites, ubiquitous species, epifaunal species which were microhabitat-restricted and seasonal species. An analysis of numerically dominant species in the different associations indicated the relative importance of ubiquitous species and seasonally abundant species. Community structure statistics (species diversity, species richness and evenness) showed difinite spatial and temporal patterns. Diversity was high at sand and muddy-Sand sites and low at mud and Elizabeth River sites. This spatial pattern was predominantly one of species richness. At Elizabeth River and mud stations, diversity increased from Feb.-Aug. because of increased evenness, while at sand and muddy-sand stations, diversity peaked in May in response to both high species richness and high evenness. The applicability of community concepts, the causes of substrate specificity, seasonality and species diversity and the effects of pollution on community structure are discussed.--Copyright 1974, Biological Abstracts, Inc.

ECOLOGY AND ANALYSIS OF TRACE CONTAMINANTS - PROGRESS REPORT, JANUARY 1973-SEPTEMBER 1973.
Oak Ridge National Lab., Tenn.
Available from NTIS, Springfield, Va 22161 as Rept No ORNL-NSF-EATC-6, $10.60/copy, $2.25/microfiche. Report No ORNL-NSF-EATC-6, January 1974. W. Fulkerson, W. D. Shults, and R. I. Van Hook, editors. 450 p, 84 fig, 70 tab, 246 ref. NSF AG 389.

Descriptors: Toxicity, *Assessment, *Trace elements, *Environmental effects, *Effluents, *Measurement, *Abatement, *Water pollution control, Transport depletion, Ion transport, Model studies, Radiation, Environment, Ecology, Ecosystems, Analytical techniques, Information exchange, Data collections, Management.

This is the second progress report of the Oak Ridge National Laboratory Ecology and Analysis of Trace Contaminants Project sponsored by the Environmental Aspects of Trace Contaminants Program of NSF/RANN. The objective is to develop techniques and information which will be useful in assessing the environmental impact of toxic trace substances and in reducing discharges of these materials. The work is not specific to any one trace contaminant, but much of the effort to date has been focused on toxic elements. The research involves five areas: (1) development of a Unified Transport Model for trace contaminants, (2) ecological research to characterize the translocation and accumulation of trace elements in the environment, (3) measurements research to improve analytical efficiency and capability, (4) development of aqueous abatement technology, and (5) information flow and management. (See W74-12022 thru W74-12036) (Houser-ORNL)

Descriptors: *Model studies, *Hydrologic models, *Sediment transport, *Settling, Velocity, *Deposition(Sediments), *Ion exchange, Movement, *Path of pollutants, Soils, Soil moisture, Absorption, Transpiration, Chemical reactions, Streams, Air pollution, Fallout, Infiltration, Transfer precipitation(Atmospheric), Environmental effects, Public health, Watershed management, Ecosystems, Simulation analysis, Missouri, Tennessee.
Identifiers: Walker Branch Watershed(Tenn), Bear Creek Watershed(Tenn), Crooked Creek Watershed(Mo).

The purpose of the Unified Transport Model (UTM) is to simulate the movement of a trace contaminant in a watershed ecosystem. Such simulation should be useful in interpolating monitoring data throughout the watershed and in extrapolating behavior over time. The model calculates the input of contaminants from atmospheric sources and the subsequent movement of these with water (and with water-transported solids) in the watershed. During this reporting period the air model was merged with a modified version of the Wisconsin Hydrological Transport Model. Work is in progress to properly account for chemical exchange and to biological translocation. The UTM (or components thereof) is being tested at the ORNL Walker Branch Watershed, at the TVA Bear Creek Watershed, and in collaboration with the University of Missouri at Rolla at the Crooked Creek Watershed in the New Lead Belt of southeastern Missouri. ENVIRONMENTAL MONITORING OF TOXIC MATERIALS IN ECOSYSTEMS,
Oak Ridge National Lab., Tenn.
S. H. Anderson, A. W. Andren, C. F. Baes, III, G. J. Dodson, and W. F. Harris.
In: ORNL-NSF-EATC-6, p 95-139, January 1974. 9 fig, 17 tab, 39 ref.

Descriptors: *Monitoring, Environment, Toxicity, *Toxins, *Trace elements, *Water pollution, *Radioisotopes, Ecosystems, Litter, Rain, Groundwater, Groundwater pollution, Ion exchange, Food chains, Cadmium, Chromium, Copper, Nickel, Lead, Zinc, *Tennessee.
Identifiers: *Walker Branch Watershed(Tenn).

Preliminary trace-element budgets have been developed for the terrestrial components of Walker Branch Watershed. Of all ecosystem components, the litter layer is most important in accumulating trace elements in this system. A preliminary input/output budget for trace elements through Walker Branch has been constructed and includes trace elements in rainfall, dryfall, throughfall, groundwater, and stream flow. Of the trace metals brought in through rainfall, 8% Cd, 26% Cr, 3.7% Cu, 6.6% Ni, 20.8% Pb, and Zn are removed in dissolved form by stream flow. The input/output measurements required development of some new analytical techniques because of the very low levels of trace elements in rainfall. Because of experience with high molecular weight amines as solvent extractants, these materials were tried and successfully used in concentrating trace elements in the various aqueous samples. (See also W74-12021) (Houser-ORNL)
W74-12023

ECOLOGY OF TOXIC METALS,
Oak Ridge National Lab., Tenn.
B. G. Blaylock, E. H. Curtis, R. A. Goldstein, J. W. Huckabee, and C. S. Matti.
In: ORNL-NSF-EATC-6, p 140-175, January 1974. 9 fig, 5 tab, 20 ref.

Descriptors: *Toxicity, *Toxins, *Trace elements, Ecology, *Mercury, *Cadmium, Movement, *Path of pollutants, Ecosystems, Absorption, Transfer, Soils, Fish, Vegetation, Litter, Food chains.
Identifiers: *Methylmercury.

The objective was to determine the fate of toxic metals in the environment and to provide data for predicting their movement and concentration in different ecosystems. Fish from the Great Smoky Mountain National Park were analyzed for methylmercury and total mercury in order to obtain background levels of mercury for comparison with polluted areas. Approximately 93% of the mercury in these fish was methylmercury. Terrestrial studies compared the movement of cadmium and mercury in an old-field ecosystem. These studies showed that mercury or cadmium entering

a terrestrial ecosystem from the atmosphere would be transferred rapidly to the soil. The transfer of these elements from vegetation and litter to soil is linear through time. Radiotracer techniques and stable chemical analyses were used in food-chain studies and to determine the influence of temperature and concentration on the methylmercury uptake in fish. HYDROLYTIC BEHAVIOR OF TOXIC METALS,
Oak Ridge National Lab., Tenn.
R. E. Mesmer, and C. F. Baes, Jr.
In: ORNL-NSF-EATC-6, p 222-239, January 1974. 2 fig, 3 tab, 33 ref.

Descriptors: *Metals, *Ion exchange, Behavior, *Equilibrium, *Hydrolysis, Research and development, Zinc, Mercury, Copper, Beryllium, Lead, Cadmium, Tin, Arsenic, Antimony, Bismuth, Boron, Scandium, Aluminum, *Chemical reaction.

The sequence of equilibrium reactions of a metal ion with water to form hydroxy complexes is referred to as its hydrolysis behavior. The chemical literature on such behavior for the ions of ten originally selected elements (Zn, Hg, Cu, Be, Pb, Cd, Sn, As, Sb, and Bi) has been critically reviewed. The scope of the project has now been broadened to cover all the metals of the Periodic Table to make available this essential information for all the metallic contaminants encountered from the many diverse industries and sources. Brief summaries of the conclusions drawn for the last five of the above list and also some expressions describing equilibrium behavior for the Group III elements--B, Sc, and Al, are presented. THE FLOW OF MERCURY IN SOCIETY,
Oak Ridge National Lab., Tenn.
W. E. Clark.
In: ORNL-NSF-EATC-6, p 407-409, January 1974. 2 tab, 1 ref.

Descriptors: *Surveys, *Data collections, *Mercury, *Census, Waste disposal, Sites, Wastes, Toxins, Environment, Federal government.
Identifiers: *Usages.

The information from questionnaires sent to various government agencies covering mercury usage during 1971 was compiled and a final report has been prepared. The conclusions are as follows: Twenty-three major agencies of the U.S. Government were questioned relative to the quantities of mercury used, usage patterns, amounts recovered and recycled, and final disposal practices. Of these major agencies eight reported negligible usage, twelve submitted essentially complete questionnaires, two submitted limited response, and one promised a limited response which has not been received. Six hundred and seventy-nine responses were obtained from individual sites or subagencies. A breakdown of usage per agency is given. (See also W74-12021) (Houser-ORNL)
W74-12036

RADIOACTIVE EFFLUENTS FROM NUCLEAR POWER STATIONS IN THE COMMUNITY; DISCHARGE DATA - RADIOLOGICAL ASPECTS.
European Communities, Luxembourg. Commission.
Available from NTIS, Springfield, Va 22161 as NP-19910; $4/copy, $2.25/microfiche. Rept No NP-19910, November 1972. 38 p, 12 tab, 20 ref.

Descriptors: *Monitoring, *Radioactivity, *Effluents, *Nuclear powerplants, *Data collections, *Discharge measurement, Gases, Aerosols, Iodine, Liquids, Tritium, Water, Potable water, Surface waters, *Europe.

Literature data for 1969, 1970, 1971 on radioactive waste discharges from the nuclear power stations in the European Community are presented. In the case of gaseous effluents a distinction is drawn between noble gases, aerosols and iodine-131, and in the case of liquid effluents between the total activity (excluding tritium) and tritium alone. The discharge data are compared with the discharge limits for the various power stations. In addition, for the liquid effluents the average yearly concentrations reached in the receiving waterbodies are shown, expressed as a percentage of the maximum permissible concentration in drinking water. An evaluation of maximum exposure around each plant site is made and a ratio of activity discharged to energy produced is given. (Houser-ORNL)
W74-12037

DISTRIBUTION, BIOLOGICAL EFFECTS, AND MIGRATION OF RADIOACTIVE ISOTOPES.
Available from NTIS, Springfield, Va 22161 as AEC-tr-7512; $10.60/copy, $2.25/microfiche. Atomic Energy Commission Report AEC-tr-7512, April 1974. 412 p, 116 fig, 186 tab, 1 biblio. Trans of Raspredelenie, Biologich eskoe Deistvie i Migratsiya, Radioaktivnykh Izotopov, Moscow 1961.

Descriptors: *Radioactivity, *Nuclear energy, *Air pollution, *Water pollution, *Soil contamination, *Water pollution sources, Nuclear explosions, Nuclear powerplants, Effluents, Bio-control, Radioactivity effects, Environmental effects, Human populations, Strontium, Cesium, Barium, Lanthanum, Ruthenium, Plutonium, Yttrium.

The scientific community of the world is becoming increasingly concerned with the problems of distribution, increased excretion, biological effects, and migration in the biosphere of radioactive nuclides. This is due to the fact not only of the possibility of broad use of atomic energy in industry, agriculture, medicine, and scientific research, discovered in the last decade, but chiefly to the progressive increase in radioactive background of earth as a result of nuclear arms testing, which is closely related to the problem of chronic exposure of man to small doses of ionizing radiation and possible appearance of long-term consequences of such exposure. This collection of reports submits data on distribution, accelerated excretion, biological effects, and migration in the biosphere of radioactive isotopes, including such practically important nuclides as cesium-137, strontium-89, strontium-90, barium-140, cerium-144, lanthanum-140, ruthenium-106, plutonium-239, and yttrium-91. (See W74-12039 thru W74-12043) (Houser-ORNL)
W74-12038

MIGRATION OF RADIOACTIVE STRONTIUM IN THE BIOSPHERE - SOME DATA ON RADIOSTRONTIUM AS A FACTOR IN ENVIRONMENTAL CONTAMINATION,
A. N. Marei.
In: AEC-tr-7512, p 349-358, April 1974. 1 diagram, 1 bibliography.

Descriptors: *Strontium, *Environmental effects, Aquatic environment, Reservoirs, *Potable water, *Fish, Food, Irrigation, *Food chains, Freshwater, Water pollution sources, Path of pollutants, Nuclear explosions, Fallout, Nuclear powerplants, Effluents, Nuclear wastes, Waste disposal, Meteorology.

The chief cause of increased radioactive background is the gradual accumulation on the earth's surface of products of uranium fission, chiefly as a result of nuclear arms tests. In addition, there are local contaminations due to radioactive waste. A chief component of the man-made radioactivity on the earth's surface is strontium. At the present time, the quantity of radioactive strontium that has settled from the atmosphere per unit of earth's surface varies. The behavior of long-lived radioactive contaminants that reach the environment is determined chiefly by two processes; dissipation and concentration, and the latter is closely related to biological phenomena, and is important to man. Radioactive fallout from the enormous volume of atmospheric air on the earth's surface could be viewed as a distinctive process of concentration of the entire mixture of radioactive elements in it. The great hygienic significance of this problem makes it imperative to continue investigation of the patterns of behavior

of strontium under diverse environmental conditions and to conduct precise quantitative estimation of its effects on man. (See also W74-12038) (Houser-ORNL)
W74-12039

SOME DATA ON MOVEMENT OF RADIOSTRONTIUM WITH GROUNDWATER CURRENT,
A. S. Belitskii, E. I. Orlova, and A. I. Ryzhov.
In: AEC-tr-7512, p 359-367, April 1974. 4 fig, 4 tab, 1 bibliography.

Descriptors: *Strontium, *Groundwater movement, *Migration, Migration patterns, Distribution, Water flow, Absorption, Desorption, Sands, *Path of pollutants, *Radioisotopes.

Migration of radiostrontium in ground water is a rather complex process related to factors mentioned below. These factors must be taken into consideration when defining the size of the sanitary safety area around sources of radioactive contamination. To date, processes of migration of radioactive substances in underground water have not been sufficiently investigated, so that there must be significant expansion in the future of field and laboratory experimental investigations in this area. The more important factors to consider in the movement of radiostrontium with groundwater currents are: (1) It is distributed chiefly in the direction of water flow. (2) Most of the radioactive strontium contained in groundwater is sorbed by sand near the contamination site. (3) Radioactive strontium absorbed by sand may re-enter groundwater as a result of desorption. (See also W74-12038) (Houser-ORNL)

ACCUMULATION OF STRONTIUM-90 IN YOUNG CARP,
G. D. Lebedeva.
In: AEC-tr-7512, p 375-378, April 1974. 3 tab, 1 biblio.

Descriptors: *Strontium, *Radioisotopes, Oceans, Sea water, Bodies of water, *Fish, *Aquatic life, *Radioactivity, *Absorption, Digestion, Speciation, Assessment, Assay, *Carp.

The use of radioactive isotopes in the national economy and in scientific research could, in spite of precautionary measures, lead to contamination of bodies of water. In view of this, many works have been published in recent times dealing with accumulation of radioisotopes in fresh and salt water organisms. Aquatic organisms have the capacity of accumulating radioactive substances with varying intensity. The rate of accumulation depends on the type of radioactive element, as well as species and physiological state of the organism. The objective of this work was to determine the rate of accumulation of radioisotopes by very young, 2-week-old fish, as well as to compare the intensity of radioisotopes accumulation in young fish of different species. DISTRIBUTION, ELIMINATION, AND COEFFICIENTS OF ACCUMULATION OF STRONTIUM-90, CESIUM-137, AND PHOSPHORUS-32 IN FISH,
D. I. Il'in, and Yu. I. Moskalev.
In: AEC-tr-7512, p 379-387, April 1974. 6 tab, 1 biblio.

Descriptors: *Reservoirs, *Public health, *Radioactivity, *Fish, *Food chains, *Human population, Bio-control, Assay, *Radioisotopes, Rates, Strontium, Cesium, Phosphorus, Aquatic environment, Transfer, Ion exchange, *Path of pollutants, Distribution, Transmissivity.

In response to the need to make a hygienic evaluation of the harmfulness of radioactive radiations, investigation of migration of radioactive elements of different biological chains, particularly those ending with man, is gaining much importance. Fish are an important element in one of these biological chains. Like numerous other living organisms, they have the capacity to concentrate radioactive substances, and for this reason they can be involved in transfer activity from the environment into the human body. Data are submitted on distribution, elimination, and coefficients of accumulation of strontium-90, cesium-137, and phosphorus-32 in organs of fish inhabiting a natural reservoir. ENVIRONMENTAL SURVEILLANCE AT HANFORD FOR CY-1973,
Battelle-Pacific Northwest Lab., Richland, Wash. Occupational and Environmental Safety Dept.
W. L. Nees, and J. P. Corley.
Available from NTIS, Springfield, Va 22161 as Rept No BNWL-1811; $5.45/copy, $2.25/microfiche. Report No BNWL-1811, April 1974. 78 p, 14 fig, 22 tab, 21 ref, 5 append.

Descriptors: *Radioactivity, *Monitoring, Environment, *Sites, *Sampling, Analysis, Surface water, Groundwater, Air, Foods, Soils, Vegetation, Columbia River, Nuclear powerplants, Effluents, Safety, Evaluation, *Washington.
Identifiers: *Hanford Site(Wash).

The 1973 Hanford Environmental Surveillance Program showed continued compliance of the Hanford contractors and their operations with applicable environmental standards. Samples of surface water, groundwater, air, foodstuffs, soil, and vegetation were collected and analyzed for radioactivity. Columbia River water also received chemical and biological analysis. Additionally, measurements were made of river immersion exposure rate, surface exposure rate (1 meter above soil surface), and radionuclide deposition on soil surfaces and highways open to public access. The shutdown of the last of the single-pass cooled production reactors (KE) in January of 1971 eliminated the major remaining source of population exposure from Hanford operations. In 1973, the average river radionuclide concentrations were less than 0.5% of the Concentration Guides for all identified radionuclides. Detail data are given. (Houser-ORNL)

ENVIRONMENTAL MONITORING REPORT FOR SANDIA LABORATORIES FOR 1973,
Sandia Lab., Albuquerque, N. Mex.
L. W. Brewer.
Available from NTIS, Springfield, Va 22161 as Rept No SLA-74-0167; $4/copy, $2.25/microfiche. Report No SLA-74-0167, April 1974. 26 p, 1 fig, 2 append.

Descriptors: *Monitoring, Environment, *Air pollution, *Water pollution, *Radioactivity, Water pollution sources, Soil contamination, Environmental effects, Environmental control, Sampling, Data collections, Regulation, Vegetation, Potable water, *New Mexico.
Identifiers: *Sandia Laboratories(N Mex).

Water, soil, and vegetation are regularly monitored by several different methods and the results analyzed to assure that Sandia Laboratories operations are not adversely affecting the surrounding environment. The radiation levels are presented for the year 1973. Based upon the environmental sampling data presented, Sandia Laboratories has not released any significant amount of radioactive contaminants to the environment during the period from January 1, 1973, through December 31, 1973. The 1973 data on soil radioactivity by comparison with previous years activity levels (obtained before the start of the two reactor facilities) and the vegetation data on the average have remained relatively constant. Water-sampling data show activity of less than the 1 x 10(minus 7) microCi Beta/ml of drinking water, which is the standard recommended for identified radionuclides according to AEC Manual Chapter 0524. (Houser-ORNL)

INDICATORS OF ORGANIC CONTAMINATION IN PLANTATION CANAL, BROWARD COUNTY, FLORIDA, 1971-72,
Geological Survey, Tallahassee, Fla.
T. N. Russo.
Florida Bureau of Geology, Tallahassee Report of Investigations No 70, 1974. 38 p, 18 fig, 8 tab, 20 ref.

Descriptors: *Water pollution, *Canals, *Florida, Water pollution sources, Municipal wastes, Water pollution effects, Biochemical oxygen demand, Dissolved oxygen, Eutrophication, *Bioindicators.
Identifiers: *Ft. Lauderdale(Fla).

The principal source of the organic materials in Plantation Canal, Fort Lauderdale, Florida, is effluent from sewage treatment plants. The waters of Plantation Canal contain large quantities of oxygen-demanding wastes and plant nutrients. Dissolved oxygen probably reaches zero just above the bottom sediments. When conditions are anoxic, anaerobic decomposition produced objectionable odors. The high concentrations of nutrients result in luxuriant growth of algae and floating

aquatic plants. These plants may discolor the water, inhibit flow and exert an oxygen demand when respiring and undergoing decomposition. Human wastes and, possibly, pathogenic bacteria are present. The bottom sediments in both Plantation Canal and South New River Canal exert an oxygen demand upon the overlying waters. They also contain high levels of plant nutrients, metals and pesticides that may be released into the overlying waters. The bottom sediments in Plantation Canal are composed of highly decomposed and stabilized sludges. The composition of the benthic communities reflects the quality of the bottom sediments and overlying waters. (Knapp-USGS)

WATER QUALITY AND RELATED STUDIES, JACKSONVILLE AREA, FLORIDA,
Geological Survey, Tallahassee, Fla.
R. W. Fairchild, and G. W. Leve.
Open-file report (Florida 73035), 1973. 34 p 11 fig, 5 tab, 10 ref.

Descriptors: *Water quality, *Urban hydrology, *Florida, Sampling, Stream gages, Streamflow, Landfills, Water pollution sources, Path of pollutants, *Hydrologic data, Basic data collections.
Identifiers: *Jacksonville(Fla), Duval County(Fla).

The water resources in the Jacksonville area, Florida, have been studied since 1960. Several studies have dealt with the water quality of streams. The U.S. Geological Survey operates 10 streamflow and sampling stations at various places on the St. Johns River. A water-quality monitor on the St. Johns River at the Main Street Bridge records hourly temperature, dissolved oxygen, pH and specific electrical conductance of the water in the river. The hourly and daily maximum, minimum and mean values of each parameter are tabulated on a computer printout. Studies are being made that will be useful for selecting and monitoring sanitary landfill sites. Geohydrologic data are presented on maps that will be useful in determining the suitability of a site for sanitary landfills or septic tanks. A comprehensive water-quality management plan is underway to identify the quality of existing receiving waters before pollution. Headwaters of eight streams in Duval County are sampled to obtain water-quality information for the city of Jacksonville in its pollution abatement program. (Knapp-USGS)

CIRCULAR TURBULENT JET IN AN OPPOSING INFINITE STREAM,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
S. Beltaos, and N. Rajaratnam.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 220-237, 1973. 8 fig, 1 tab, 11 ref.

Descriptors: *Jets, *Mixing, *Dispersion, *Waste dilution, Path of pollutants, Waste disposal, Waste water disposal.
Identifiers: Counterflow jets.

Jets in counterflow spread rapidly and can be used to obtain rapid dilution of effluent discharges. The propagation of a turbulent round jet in an infinite opposing stream was studied utilizing data available in literature and new experimental data. It is possible to predict the flow field in a simple manner, using a semiempirical approach. Preliminary comparisons show that a jet issuing against a stream is an efficient means for obtaining rapid dilution of effluent discharges. (See also W74-12087) (Knapp-USGS)

LATERAL MIXING CHARACTERISTICS OF THE HYDRAULIC JUMP IN A SPATIALLY-VARIED FLOW,
Ottawa Univ. (Ontario). Dept. of Civil Engineering.
R. Townsend, and D. L. Egar.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 238-256, 1973. 13 fig, 5 ref.

Descriptors: *Mixing, *Hydraulic jump, *Heated water, Waste water disposal, Thermal pollution, Open channel flow, Water pollution sources.

Hydraulic jump can be used to effect rapid lateral mixing of a tempering flow introduced on one side of a model effluent discharge channel. The problem of predicting the location of jumps, with spatially varied upstream flows, was considered. Tests indicated that a jump could be used effectively to accelerate the mixing process, and that standard methods for the prediction of location are inadequate when the jump forms near the confluence of the two streams. FORECASTING POLLUTION IN RIVERS, ESTUARIES AND THE SEA,
Water Pollution Research Lab., Stevenage (England).
I. C. Hart, M. J. Barrett, and A. L. H. Gameson.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 129-180, 25-27 September, 1973. 17 fig, 4 tab, 23 equ, 26 ref.

Descriptors: *Water pollution control, *Forecasting, *River systems, *Estuaries, *Oceans, *Computers, *Model studies, Sewage, Effluents, Simulation analysis, Coliforms, Data collections, Discharge(Water), Pollutants, Dissolved oxygen, Systems analysis.
Identifiers: Offshore areas, Trent River(England), Inorganic nitrogen.

The Water Pollution Research Laboratory examines the effects produced by the discharge of polluting liquids into natural waters. Studying existing situations in sufficient detail facilitates forcasting pollution in other circumstances and other systems. These effects are generally very complex and frequent use is made of computers to deal with the large number of interrelated factors and to expedite the numerical work. This paper illustrates the utilization of computers to tackle three separate problems of pollution forecasting: in rivers, estuaries, and the sea. In each case, details are given of the methods of data analysis. The first section shows how the examination of mass budgets in rivers and the determination of the sources of pollutants enable the construction of forecasting models for water quality. A model developed for predicting concentrations of inorganic nitrogen is described. In section 2, methods for predicting the effect of changes in quantity or quality of effluents in estuaries are reviewed: mixed-segment model; quantized mixing model; time-dependent models; and a two-dimensional steady-state model. Considered also is the calculation of distribution of dissolved oxygen. Section 3 presents a simple simulation model of the processes occurring in the sea, accounting for the rate of addition of coliform bacteria, the initial dispersion, vertical mixing, topography, tidal movement, eddy diffusion, and coliform mortality. Input data are considered and the results examined. (See also W74-12107) (Bell-Cornell)

COMPUTER APPLICATIONS IN WATER QUALITY MODELLING: PREDICTION OF AMMONIACAL NITROGEN IN THE RIVER THAMES,
EASAMS, Camberley (England).
N. C. Oxley.

In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 71-74, 25-27 September 1973. 1 fig, 1 tab.

Descriptors: *Water quality control, *Computer models, *River systems, *Statistical models, *Monitoring, Effluents, Standards, Equations, Hydrologic data, Stochastic processes, Catchments, Reach(Streams), Management, Systems analysis.
Identifiers: *River Thames(England), *Ammoniacal nitrogen, Concentration, Sewage works.

Due to the current concern over the effects of increasing discharges of sewage effluent, a computer model has been developed to predict the concentration of Ammoniacal Nitrogen at defined points in the Thames River. High ammonia concentrations inhibit the disinfection of water for supply and raise the costs of chlorination. Water quality relationships have been developed from a statistical basis, using data routinely collected by the Thames Conservancy from 1967 through 1973. The situation for each discrete element, into which the River may be divided, is amenable to multiple regression analysis, the final concentration being the dependent variable. The whole complex system of inputs and abstractions is broken down into a series of rational systems, each amenable to computer analysis. Individual regression equations have been built into the final model to predict ammonia concentrations at 12 monitoring points in the main river. Statistical modelling recognizes the stochastic nature of those parameters affecting quality levels, while obviating the necessity for long-term research into causal interactive relationships. The short computer time required to generate a series of predictions of concentration, and the accuracy of the predictions, suggests that this may be a useful technique in water quality management. ECOLOGICAL STUDY OF SALMONELLA IN WASTE WATER, STAGNANT WATER, RUNNING STREAMS AND DOMESTIC WELLS OF ANJOU, (IN FRENCH),
Faculte de Medecine et Pharmacie, Angers (France). Laboratoire de Bacteriologie.
F. Parvery, J. P. Becaud, G. Chambreuil, and B. Carbonnelle.
Rev Epidemiol Med Soc Sante Publique. Vol 20, No 7, p 603-618, 1972. English summary.
Identifiers: *Ecological studies, *Salmonella, Salmonellosis, Stagnant water, Streams, Wastes, Water wells, *France(Anjou), Water pollution sources.

In the framework of an ecological survey carried out on Salmonella in Anjou, France, 2372 samples were analyzed. Strains (109) of Salmonella were isolated. The great diversity of the serotypes found is underlined. When a sufficient number of these serotypes are isolated, they appear to be the same ones as those isolated in patients. The chronological and topographical concordance is also reported. The isolation of a serotype in water at a given season often procedes the finding of corresponding clinical cases. In another connection, the distribution of the cases of human salmonellosis, especially along rivers, is obvious. The climatologic factors eventually linked to the contamination of water by Salmonella were analyzed: temperature, rain, river, flow, etc. The water purification stations are helpless in the treatment of bacterial pollution. These stations sometimes even introduce pathogenic bacteria. Such stations could be the ideal way to control endemics, if a serious effort were made to ensure bacteriological purification.--Copyright 1973, Biological Abstracts, Inc.

PHOTOIONIZATION OF PHENOLS IN WATER: EFFECTS OF LIGHT INTENSITY, OXYGEN, PH, AND TEMPERATURE,
Hebrew Univ., Jerusalem (Israel). Dept. of Physical Chemistry.
J. Feitelson, E. Hayon, and A. Treinin.
J Am Chem Soc. Vol 95, No 4, p 1025-1029, 1973, Illus.
Identifiers: *Cresol, Ionization, Light intensity, Oxygen, *Phenols, *Photoionization, Temperature, *Tyrosine, Hydrogen ion concentration.

The effects of flash intensity, oxygen, pH, and temperature on the photoionization of p-cresol and tyrosine were investigated by measuring the yields of the phenoxyl radicals generated in aqueous solutions. Photoionization of the phenols and their anions in alkaline solution occur via biphotonic and monophotonic processes, respectively. The (phenoxyl) is proportional to I sup n, where n changes from 2 to 1 over a relatively narrow pH range. In air-saturated solutions of the phenols, the transient absorption spectra of the phenoxyl radicals are observed but their initial yields are somewhat lower and are proportional to approximately I1.5. There is no distinct difference between the effects of 1 atm of air and 1 atm of O2. In alkaline solutions (pH approximately 12) the effect of oxygen is relatively small. On the other hand, the anions display much higher sensitivity toward temperature; in alkaline solutions the yield of photoionization is hardly affected over the same temperature range. These results are interpreted on the basis of a mechanism involving ionization of triplet excited-state molecules. In neutral solutions the triplets exist in their acidic form and their ionization is induced by light, whereas in alkaline solutions the basic forms of the triplets, which are shorter lived, undergo thermal ionization with higher activation energy. A possible explanation of the oxygen effect is the formation of longer lived triplet-oxygen complexes which are then photoionized. Under all conditions employed the lifetimes of the precursors of phenoxyl radicals and e sub aq appear to be short compared to the duration of the flash employed (approximately 10 microsec).--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Thermal pollution, *Discharge(Water), Water quality, Water quality control, Water pollution, Water pollution control, Surface waters, *Forecasting.
Identifiers: *Surface discharge, *Thermal plumes.

In a continuing effort to present current knowledge on heated plume prediction, nomograms are presented that describe the behavior of surface jets for a wide range of ambient and initial discharge conditions encountered in practice. An attempt is made to present the material in a concise manner and in a format that is clear and accessible to a nonspecialist user. Many fundamental derivations are retained for further reading in the appendix; these undoubtedly would be of use to the specialist researcher. The nomograms provide qualitative results describing the surface plume trajectory, width, temperature, depth, surface area and time of travel along the plume centerline. The nomograms are not intended to be used as exclusive design tools for surface discharge problems for use in a precise prediction of any specific surface plume condition. The nomograms are generated predominately from an idealized mathematical model of a plume. Some field and laboratory data have been used to adjust the performance of the model so that more realistic predictions are obtained. However, the class of problems that can be handled this way are limited due to the limitations in the model itself. The main restrictions included in the model are described both in a special chapter and in example problems. (See also W74-05111) (EPA)

Descriptors: Water quality, Water pollution control, *Nitrogen, *Phosphorus, Seasonal, Fertilizers, Sediments, *Alabama, Silts, Loam, Nutrients, *Cooper, Ureas, Nitrates, Cotton, Corn(Field), Soybeans, Path of pollutants.
Identifiers: *Nutrient loss reduction, *Decatur silt loam, Seasonal-Cropping-Fertilizer effects, Sediment loss interactions, Millet, Ammonium nitrate, Sulfur-coated urea.

A study of nitrogen and phosphorus losses from Decatur silt loam soil was conducted over three cropping periods from 1969-1972. Experimental agronomy plots were seeded to cotton, corn, soybeans, and millet and compared with uncropped and unfertilized check plots. The effects of these crops on nitrogen losses--total nitrogen, nitrate-nitrogen, and ammonium-nitrogen (for 1971-1972 only) and phosphorus losses were evaluated. Average total rainfall and losses of sediment and runoff were also determined. Losses of total nitrogen and nitrate-nitrogen were generally positively correlated with the amounts of rainfall, runoff, and sediment. Phosphorus losses were positively correlated with sediment losses. More than 95% of phosphorus losses were associated with sediment loss. The effect of crops on loss of all nutrients was considerably smaller than seasonal effects and sediment losses. The effect of two fertilizers, ammonium nitrate and sulfur-coated urea, upon nutrient losses showed no evidence of superiority for sulfur-coated urea in reducing the total nitrogen or nitrate-nitrogen losses. THE COMMON MUSSEL MYTILUS EDULIS AS INDICATOR FOR THE LEAD CONCENTRATION IN THE WESER ESTUARY AND THE GERMAN BIGHT, (DIE MIESMUSCHEL MYTILUS EDULIS ALS INDIKATOR FUR DIE BLEIKONZENTRATION IM WESERASTUAR UND IN DER DEUTSCHEN BUCHT),
Institut fuer Meeresforschung, Bremerhaven (West Germany).
J. Schulz-Baldes.
Marine Biology, Vol 21, No 2, p 98-102, 1973. 4 fig, 1 tab, 16 ref.

Descriptors: *Mussels, *Bioindicators, *Lead, Mollusks, Heavy metals, Metals, Pollutants, Spectrophotometry, Analytical techniques, Size, Bioassay, Gradation, Absorption, Estuaries, Water pollution sources, Heavy metals, Metals, Animal physiology.
Identifiers: *Mytilus edulis, Concentration, Kidney, *Germany(Weser Estuary), *Germany(German Bight).

Common mussels were collected at 13 stations of the Weser Estuary, and the German Bight in 3 size categories. Equal numbers of the 3 groups from each station were analyzed separately for lead concentration by flameless atomic-absorption spectrophotometry. The lead concentration of the soft parts decreases from 6.4 microgram/g dry weight 15 km northwest of Bremerhaven to 1.9 microgram/g at Helgoland. At the same station, the concentration in small mussels is higher than in larger mussels. The lead concentration is exceptionally high in the kidney, quite high in the intestine (with the digestive glands) and in the adductor muscle, and rather low in the foot, gills, and mantle with gonads. Laboratory experiments reveal that mussels directly reflect the actual lead concentration of their environment. The observed gradient in lead contents of M. edulis in the Weser Estuary can thus be explained by the dilution of the highly lead-polluted river water by the sea water of the German Bight. With this physiological property, M. edulis is, therefore, highly suitable as an indicator organism for lead, and possibly other heavy metal pollutants. (Katz)

CHARACTERISTICS AND COMPARATIVE MAGNITUDE OF NON-POINT SOURCES,
Cornell Univ., Ithaca, N.Y. Coll. of Agricultural Engineering.
R. C. Loehr.
Journal Water Pollution Control Federation, Vol 46, No 8, p 1849-1872, August 1974. 2 fig, 17 tab, 59 ref.

Descriptors: *Water pollution sources, *Phosphates, *Nitrogen, *Drainage, Fallout, Farm wastes, Storm runoff, Urban runoff, Tile drainage, Seepage, Runoff, Surface runoff, Agricultural runoff, Small watersheds, Forests, Surface waters, Return flow, Water quality, Feed lots.
Identifiers: *Non-point sources, Potential area yield rate.

Data from investigations reported in the literature of potential pollution sources were used in a comparison of the characteristics and relative magnitude of non-point sources discharged to surface waters. The comparisons were made in terms of concentration (mg/l) and potential area yield rate (kg/yr/ha). The non-point sources included precipitation, forest land runoff, range land runoff, cropland runoff, runoff from land receiving manure, cropland tile drainage, irrigation return flows, urban land runoff, manure seepage, and feedlot runoff. The feasibility of controlling the various non-point sources was discussed. Non-point sources of nitrogen and phosphorus were compared with point sources in a small number of watersheds. (Humphreys-ISWS)

METAL DISTRIBUTION ALONG A PROFILE OF AN INTER-TIDAL AREA,
Stockholm Univ. (Sweden). Geological Inst.
R. O. Hallberg.

Estuarine and Coastal Marine Science, Vol 2, No 2, p 153-170, 1974. 8 fig, 6 tab, 43 ref.

Descriptors: *Metals, *On-site investigations, *Sediments, *Tidal marshes, *Path of pollutants, Evaluation, Geologic investigations, Coastal marshes, Sampling, Sediment distribution, Shallow water, Marine geology, Chemical analysis, Sodium, Potassium, Magnesium, Calcium, Iron, Cobalt, Nickel, Copper, Lead, Profiles.
Identifiers: Silver, Netherlands(Ameland Island).

The sediment from an intertidal area was investigated with regard to the vertical and areal distribution of the acid-soluble metals: Na, K, Mg, Ca, Fe, Co, Ni, Cu, Ag and Pb. In addition to the metals, granulometric properties, content of organic matter, carbonate concentrations and Eh were measured. The metals were accumulated along the margins of the area and showed a high correlation with organic matter and the finest sediment fraction. The interstitial water was diluted with infiltratable rain water. The higher level of this water, of the marsh area compared with that of the tidal flat area, gives rise to an upward percolation in the sediment of the tidal flat area. The metal interrelationships and concentrations were determined by processes in the uppermost oxidized layer and only to a minor extent by reducing processes in the lower hydrogen sulphide-rich layers. THE EMISSION OF BIOGENIC HYDROGEN SULFIDE FROM AMAZONIAN FLOODPLAIN LAKES,
Instituto Nacional de Pesquisas da Amazonia, Manaus (Brazil).
W. L. F. Brinkmann, and U. De. M. Santos.
Tellus, Vol 26, No 1-2, p 261-267, 1974. 6 fig, 5 ref.

Descriptors: *Lakes, *Hydrogen sulfide, *On-site investigations, *Dissolved oxygen, Flood plains, Hypolimnion, Limnology, Sulfides, Oxygen, Water pollution, Sampling, Chemical analysis, Fronts(Atmospheric), Floods, Fallout, Rain forests, Distribution patterns, Profiles.
Identifiers: *Amazon River, *Brazil(Lago do Castanho), Biogenic hydrogen sulfide, Cold front.

The emission of hydrogen sulfide from Amazonian floodplain lakes was detected mainly during the period of falling water of the Amazon river, which peaks out in September and October. Hydrogen sulfide was present even in some surface water samples (up to 0.40 mg at. H2S as S/1). A part of the emitted hydrogen sulfide was recycled on a regional or local scale by means of biospheric trap mechanisms and eventual rainout, sustaining the tight sulfur cycle of the Amazonian tropics. But a certain amount of the emitted hydrogen sulfide contributed to the atmospheric sulfur budget. Under cold front conditions, however, the emitted hydrogen sulfide was rapidly recycled into the tropical forest stands. (Humphreys-ISWS)

ADSORPTION OF PHOSPHATE BY RIVER PARTICULATE MATTER,
Illinois State Water Survey, Peoria. Water Quality Section.
W-C. Wang.
Water Resources Bulletin, American Water Resources Association, Vol 10, No 4, p 662-671, August 1974. 6 fig, 1 tab, 13 ref.

Descriptors: *Adsorption, *Sediments, *Phosphates, Water pollution sources, Isotherms, Montmorillonite, Bentonite, Laboratory tests, Suspended solids, Illinois.
Identifiers: *Illinois River(Ill), *Spoon River(Ill), Particulate water, Phosphate adsorption, Adsorption kinetics.

Adsorption of orthophosphate on samples of particulate matter taken from the Illinois and Spoon Rivers was investigated under laboratory conditions. Adsorption equilibria were reached in four to six days. Average adsorption rates between 0.0239 and 0.0366 were found during equilibration periods. Adsorption isotherms were computer, both for constant and for varying amounts of particulate matter in the two rivers. During investigation of the effects of pH on phosphate adsorption, the highest adsorptive capacities were found at natural pH values of 8.3-8.4. Reductions in pH dropped this capacity to a minimum at pH6. Some slight recovery of capacity was observed at pH5 and 4. Rates of adsorption were influenced by the equilibrium concentration of phosphate-P and were essentially the same for the Illinois and Spoon Rivers. However, based upon the quantity of phosphate-P adsorbed per unit weight of particulate matter present, the capacity of the Illinois was seven times that of the Spoon River. Adsorption isotherms for both streams were essentially linear, suggesting a functional relation between unit adsorption and particulate matter content. A concurrent study of samples collected daily from the Illinois River failed to show a similar correlation of particulate matter and phosphate adsorption. (Harmeson-ISWS)

PERSISTENCE AND MOVEMENT OF DBCP IN THREE TYPES OF SOIL,
California Univ., Davis. Dept. of Nematology.
L. R. Hodges, and B. Lear.
Soil Science, Vol 118, No 2, p 127-130, August 1974. 2 tab, 4 ref.

Descriptors: *Persistence, Movement, *Soil types, *Fumigants, *Injection, Irrigation water, Soil water, Gas chromatography, *Path of pollutants, Pollutant identification.
Identifiers: *Dibromochloropropane, Volatile chemicals, Sandy clay loam, Silt loam, Loamy sand.

The rates of distribution of dibromochloropropane (DBCP) and its persistence in three types of soil were compared after application by injection and flood irrigation. Measurement of DBCP by gas chromatography showed that an injection DBCP at a depth of 20 cm resulted in higher concentrations and deeper penetration in sandy clay loam and silt loam than when it was applied to irrigation water. Application of the same amount to the soil surface in 15 cm of water showed DBCP is trapped near the surface in these soils. Persistence is longer in these two soils and in loamy sand after injection. The most rapid penetration after application in water occurred in loamy sand where the rate and depth of penetration were greater than those measured after injection. This study indicates that type of soil is one of the most important aspects in deciding what method to use for applying DBCP. (Visocky-ISWS)

THE ABSORPTION OF LOW CONCENTRATIONS OF SULPHUR DIOXIDE INTO AQUEOUS SOLUTIONS,
Auckland Univ. (New Zealand). Dept. of Chemistry.
P. Brimblecombe, and D. J. Spedding.
Tellus, Vol 26, No 1-2, p 272-276, 1974. 4 fig, 2 tab, 11 ref.

Descriptors: Sulfur, *Sulfur compounds, *Absorption, *Aqueous solutions, Analytical techniques, Radiochemical analysis, Physical properties, Chemical properties, Sorption, Equilibrium, Solubility, Water vapor, Phase diagrams, Humidity, Water properties, Water pollution, Diffusion, Sulfates.
Identifiers: *Gas-phase diffusion, *Soultion phase diffusion, *Sulfur dioxide, Desorption, Beta-spectrometers, Liquid scintillation spectrometers, Oceanic absorption, Ionic strength.

The rate of deposition of gas-phase SO2 to a variety of aqueous solutions was measured. The deposition rate was unaffected by relative humidity. Some salts may cause a 3-fold decrease in deposition rate as the ionic strength changes from 0.1 M to 0.8 M. Solution pH has the greatest influence causing a change from gas-phase diffusion control to solution phase diffusion control of deposition between pH 4 and pH 2. Indirect evidence suggested that the catalysis of SO2 oxidation in solution by Mn (II) ions is slow with respect to SO2 diffusion into solution. The practical implications of these results were discussed. (Henley-ISWS)

WATER QUALITY AND POLLUTION--SOUTH FORK OF LONG ISLAND, NEW YORK,
Wisconsin Univ., Oshkosh. Dept. of Geology.
C. W. Fetter, Jr.
Water Resources Bulletin, American Water Resources Association, Vol 10, No 4, p779-788, August 1974. 3 fig, 5 tab, 5 ref.

Descriptors: *Water pollution, *Saline water intrusion, *Nitrates, Groundwater, Groundwater recharge, Water quality, *New York.
Identifiers: *Long Island(NY), Magothy aquifer, Glacial aquifer, Cesspools, Agricultural fertilizers.

The South Fork of Long Island is an area totally dependent on ground water for domestic and municipal water supply. Groundwater is contained in two geohydrologic units; the Glacial aquifer and the Magothy aquifer. The study evaluated water quality in both these aquifers as well as in several lakes and ponds. Listed as the principal sources of groundwater contamination were saline water encroachment, agricultural fertilizers, and the underground discharge of numerous cesspools. Less than ten percent of the population is served by sewers and sewage treatment. The nitrate content of 651 domestic wells was shown in a statistical tabulation. Some data on the presence of detergents and chlorides were given. Comparisons were made between ground and surface water quality. (Harmeson-ISWS)

THE SOLUBILITY OF VERY LOW CONCENTRATIONS OF CARBON MONOXIDE IN AQUEOUS SOLUTION,
Auckland Univ. (New Zealand). Dept. of Chemistry.
R. W. Meadows, and D. J. Spedding.
Tellus, Vol 26, No 1-2, p 143-150, 1974. 2 fig, 6 tab, 13 ref.

Descriptors: Carbon, *Oxides, *Aqueous solutions, *Solubility, Gases, Physical properties, Phase diagrams, Saturation, Pressure, Atmospheric pressure, Saline water, Sea water, Fresh water, Absorption.

Identifiers: *Carbon monoxide, Solubility coefficient, *Absorption coefficient, Partial pressure, Henry's law, Exchange constants, Boundary layer, Radiochemical technique, Desorption, Supersaturation, Gas phase, Marine water.

The solubility of carbon monixide in natural waters was determined when the partial pressure of carbon monoxide in the gas phase approaches atmospheric concentrations. For both pure water and seawater the solubilities were found to be more than eight times the values which have previously been observed with an atmosphere of pure carbon monoxide present. Carbon monoxide therefore does not obey Henry's law over the pressure range from approximately 0.00005 atmospheres to greater than one atmosphere. The exchange constant for the exchange of carbon monoxide across the boundary layer of aqueous solutions was also determined. Values for seawater range from 1.5 times 10 to the minus 7th power m/s under calm conditions to 1 times 0.000006 m/s under the most turbulent conditions studied. The data obtained was used to re-evaluate the existence and size of the proposed oceanic source of carbon monoxide. A value of 10 to the 11th power g of carbon monoxide was calculated for the amount of carbon monoxide produced annually by the world's oceans, and this represents only 0.05% of the estimated carbon monoxide produced by man, and less than 0.002% of the largest natural source of carbon monoxide, which is the atmospheric oxidation of methane. Available from NTIS, Springfield, Va 22161 as PB-227 032, Price $18.50 printed copy; $2.25 microfiche. Technical Report 54, March 1973. 301 p.

Descriptors: *Water quality, *Path of pollutants, *Mathematical models, *Computer programs, Dissolved oxygen, Simulation analysis, Streamflow, Oxygen demand.

Two mathematical models were designed to meet needs of Federal, State or local agencies for water quality planning. The models are designed specifically for water bodies in which widths are small relative to their length. Most freshwater streams and tidal tributaries to estuarine bays fit that description. These are waters whose net hydraulic circulation patterns are essentially undirectional. (Knapp-USGS)

EFFECTS OF CLEAR CUTTING ON WATER DISCHARGE AND NUTRIENT LOSS, BITTERROOT NATIONAL FOREST, MONTANA,
Montana Univ., Missoula. Dept. of Geology.
T. Bateridge.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 038, $3.75 in paper copy, $2.25 in microfiche. Montana University Joint Water Resources Research Center, Bozeman, Completion Report No 52, July, 1974. 68 p, 15 fig, 15 tab, 59 ref. OWRT A-071MONT(1). 14-31-0001-4026.

Descriptors: *Clear-cutting, *Water pollution sources, *Montana, Water yield improvement, Water quality, Water chemistry, Nutrients, Streamflow, Discharge(Water), *Roads, *Conductivity, *Ions, Path of pollutants.
Identifiers: *Bitterroot National Forest(Mont).

The effects of clearcutting and road-building on the hydrology and water-chemistry of three pairs of small watersheds in the Bitterroot National Forest in Western Montana were studied for one year (1973). The watersheds were all steep, 6,000 to 7,000 feet in elevation, and ranged from 103 to 866 acres in area. 1973 was an abnormally dry year. Streamflow discharge was monitored throughout the snowmelt runoff period on each watershed. Water samples were collected from which field measurements of electrical conductivity were made, and laboratory tests were made for five specifications. pH was measured in the field. For two of the three pairs of watersheds, streamflow throughout the season was greater on the clearcut basin. For the smallest pair the same trend was observed, but flow ceased after June 26th. Conductivity varied inversely with discharge, and in most cases was higher on the control (forested) watersheds. Concentrations of ions (nitrates, chlorides, divalent cations, sodium and potassium) were relatively low, but tended to increase as streamflow diminished, and were generally higher on clearcut watersheds. (Williams-Montana State)

EFFECTS OF SUSPENDED SILT ON DISSOLVED PHOSPHORUS LEVEL IN THE GALLATIN RIVER,
Montana State Univ., Bozeman. Dept. of Plant and Soil Science.
F. J. Adamsen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 048, $4.00 in paper copy, $2.25 in microfiche. Montana University Joint Water Resources Research Center, Bozeman, Completion Report No. 56, August 1974. 79 p, 10 fig, 13 tab, 61 ref, (M.S. Thesis). OWRT A-060 MONT(1). 14-31-0001-3826.

Descriptors: Water pollution sources, *Phosphorus, *Montana, *Suspended load, Dissolved solids, Phosphates, Soil erosion, *Sediment transport, Calcium, *Path of pollutants, Carbonates, Sulfates.
Identifiers: *Gallatin River(Mont).

A two-year study of suspended sediments in the Gallatin River of southwestern Montana and its tributaries reveals that the predominations in the water were Ca+2 and HC0-3. During May and June, the concentration of dissolved solids was lower than in other periods (attributed to increased runoff from melting snow). During these months concentrations of suspended solids and dissolved phosphorus and the phosphorus content of the sediments were highest (probably due to increased amounts of surface soil erosion). The East Gallatin River (a major tributary draining significant areas of irrigated farmland as well as serving as receptor for Bozeman's sewage effluent) was supersaturated in phosphorus with respect to hydroxyapatite, while sites on the main stem Gallatin above the East Gallatin were below saturation. Extraction of sediments with NaHCO3 showed sediments from the East Gallatin to be higher in extractable phosphorus than upstream sites. Extraction of phorphorus from the sediments by fungus indicated that 20 to 70 percent of the phorphorus content of the sediments may be biologically available. (Williams-Montana State)

EVOLUTION OF ANOXIC CONDITIONS IN BLACK SEA DURING HOLOCENE,
Woods Hole Oceanographic Institution, Mass.
W. G. Deuser.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E.T., and Ross, D.A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 133-136, 1974. 3 fig, 14 ref. NSF Grant GA-1659.

Descriptors: *Density stratification, *Dissolved oxygen, *Water circulation, Salinity, Hydrogen sulfide, Water chemistry, Sea water.
Identifiers: *Black Sea, *Anoxic conditions.

The condition for oxygen depletion in the Black Sea was established 9,000 years ago, when significant influx of Mediterranean water through the Bosporous began to develop density stratification in the basin. If a logarithmically decreasing rate of oxygen consumption is assumed, a 'decay' constant for the oxygen reservoir can be calculated, corresponding to a half life of 1,800 years. With the aid of this constant and curves of the distribution of volume and area versus depth, the rise of the 02-H2S interface and the growth of the anoxic water in terms of occupied volume and bottom area can be calculated. In agreement with observations, the calculations show that anoxic conditions began in the deepest part of the basin about 7,300 years ago and that the interface has continued to rise slowly in the recent past. (Knapp-USGS)
W74-12375

DISTRIBUTION OF SOME TRACE ELEMENTS IN BLACK SEA AND THEIR FLUX BETWEEN DISSOLVED AND PARTICULATE PHASES,
Woods Hole Oceanographic Institution, Mass.
P. G. Brewer, and D. W. Spencer.
In: The Black Sea--Geology, Chemistry, and Biology; Degens, E.T., and Ross, D.A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 137-143, 1974. 12 fig, 3 tab, 16 ref. USAEC Contract AT (30-1)-4150 and NSF Grants GA-13574 and GA-1659.

Descriptors: *Water chemistry, *Density stratification, *Sulfides, *Dissolved oxygen, *Trace elements, Bottom sediments, Suspended load, Geochemistry, Advection.
Identifiers: *Black Sea, *Pycnocline.

The trace-element geochemistry of the Black Sea is dominated by the strong pycnocline separating the oxygenated and reducing environments. Using values of the vertical advective velocity and vertical eddy-diffusion coefficient derived from a model, the flux of dissolved sulfide, manganese, iron, copper, and zinc through this interface was estimated. The calculated sulfide flux is smaller than estimates of sulfide production in the sediments by a factor of four, but is consistent with estimates of chemosynthesis, suggesting that a sulfide-removal mechanism must operate. From the manganese data, it was estimated that about 78 percent of the detrital load of rivers entering the Black Sea is deposited near the mouths of the rivers and only 22 percent is spread over the surface of the Black Sea. If the mean sinking rate is 1,000 m/year, the data on the distribution and elemental composition of particulate matter in the

Black Sea are in agreement with estimates of river input. (KnappnUSGS)

PHOSPHORUS IN BLACK SEA,
Fishery Board of Sweden, Gotenburg. Hydrographic Dept.
S. H. Fonselius.
In: The Black-Sea--Geology, Chemistry, and Biology; Degens, E.T., and Ross, D.A., editors: American Association of Petroleum Geologists, Tulsa, Oklahoma, Memoir 20, p 144-150, 1974. 7 fig, 3 tab, 15 ref.

Descriptors: *Phosphorus, *Water chemistry, Dissolved oxygen, Density stratification, Water balance, Nutrients, Water analysis, Sampling.
Identifiers: *Black Sea.

The concentrations of inorganic phosphorus and total phosphorus in the Black Sea were measured during the cruise of the R/V Atlantis II. organic phosphorus was determined from the difference between total and inorganic phosphorus. Detailed studies were made of the distribution of phosphorus through the halocline and close to the bottom of the central deep-sea basin. By use of a model of the water balance of the Black Sea, a crude phosphorus balance model was constructed. About 6,7000 tons/year of phosphorus must be added to the Black Sea sediments in order for the phosphorus concentration to remain at a constant level. (Knapp-USGS)

METHYLMERCURY COMPLEXES IN AQUATIC SYSTEMS,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
R. G. Zepp, G. L. Baughman, N. L. Wolfe, and D. M. Cline.
Environmental Letters, Vol 6, No 2, p 117-127, 1974. 4 fig, 3 tab, 20 ref.

Descriptors: *Mercury, *Organic compounds, *Aquatic environment, Proteins, Amino acids, Sulfur compounds, Sorption, Water pollution sources.
Identifiers: *Methylmercury.

Equilibrium calculations indicated that methylmurcuric ion is almost completely complexed under conditions that exist in fresh waters, and the sulfur bonded complexes are likely to be the predominant forms of methylmercury in fresh natural waters. Calculations are presented concerned with the extent and nature of such complexations. The following conclusions were derived: (1) methylmercury ion makes up only an extremely small fraction of the total dissolved methylmercury in the aquatic environment. Essentially all of the methylmercury exists as various complexes, whose nature strongly depends upon pH and the concentrations of the complexing species; (2) common chemical species such as orthophosphate, ammonia, phenolic groups, and protein amino groups have little effect upon complexation of methylmercury; (3) calculations indicate that methylmercury can be freed from sulfur-bonded complexes by strong acidification or addition of high concentrations of halide ions; (4) sulfur-bonded methylmercuric complexes are likely to be very important in the aquatic environment. Trace concentrations of reduced sulfur species or thiols are sufficient to quantitatively complex methylmercury even with much higher concentrations of other chemical species present. Environmental Research, Vol 6, No 4, p 479-484, December, 1973. 2 fig, 4 tab, 6 ref. NSF (GI-30015) USAEC(AT-(40-1)-2401).

Descriptors: Transfer, *Mercury, *Rodents, *Tracers, *Milk, Animal physiology, Organic compounds, Inorganic compounds, Laboratory tests, Laboratory animals, Testing procedures, Analytical techniques, Distribution, Path of pollutants.
Identifiers: *Methylmercury.

The maternal-fetal transfer or organic and inorganic mercury across the placenta and through mother's milk has been investigated in the rat. Organic mercury is more readily transferable across the placenta than inorganic mercury. However, both forms of mercury were transferred through milk with approximately the same efficiency. The mercury concentrations in the placenta and the infant hair are directly related to the infant's body burden of mercury. (Jernigan-Vanderbilt)

RETENTION OF TWO MERCURIALS BY STRIPED MULLET, MUGIL CEPHALUS,
National Marine Water Quality Lab., Johns Island, S.C.
D. P. Middaugh, and C. L. Rose.
Water Research, Vol 8, No 3, p 173-177, March, 1974. 5 tab, 13 ref.

Descriptors: *Mercury, *Mullets, *Organic compounds, *Inorganic compounds, *Path of pollutants, Toxicity, Seawater, Laboratory tests, Laboratory animals, Testing procedures, Analytical techniques, Animal physiology.

The uptake and retention of phenyl mercuric nitrate (PMN) and mercuric chloride (HgCl2) were studied in Mugil cephalus, the common saltwater mullet. Fish were exposed to calculated doses of 10, 50, 100 and 500 parts per billion (ppb) mercury of each toxicant in seawater for three hours. Thereafter, they were held in tanks with flowing seawater for 216h. Fish were sacrificed at 72-h intervals during holding period to determine levels of mercury in gill, liver and muscle tissues. Higher mercury levels were found in mullet exposed to PMN than in those exposed to equivalent concentrations of HgCl2. No deaths occurred among mullet dosed with HgCl2 whereas 58 per cent of those exposed to the highest level of PMN died within 21h of exposure. Mercury levels detected in tissues appeared to be related to the toxicant used, dose levels, and time of sampling after exposure. (Jernigan-Vanderbilt)

COMPARISON OF CADMIUM 115M RETENTION IN RATS FOLLOWING DIFFERENT ROUTES OF ADMINISTRATION,
National Water Quality Lab., Cincinnati, Ohio. Newtown Fish Toxicology Lab.
W. Moore, Jr., J. F. Stara, W. C. Crocker, M. Malanchuk, and R. Iltis.
Environmental Research, Vol 6, No 4, p 473-478, December, 1973. 1 fig, 1 tab, 11 ref.

Descriptors: *Cadmium, *Rodents, *Absorption, *Animal physiology, Retention, Trace elements, Laboratory tests, Laboratory animals, Testing procedures, Analytical techniques, Spectroscopy, *Radioisotopes, Path of pollutants.

Whole body retention studies of Cd 115m were carried out on rates following four different routes of administration: oral, inhalation, intraperitoneal, and intravenous. The retention curve for each route of administration was divided into two components. The first component reflected the initial rapid clearance of Cd 115m primarily by the gastrointestinal tract and the second component indicated the absorption and turnover of Cd 115m. Extrapolation of the second component to the intercept gave initial absorption values of 93%, 91%, 41% and 2.3% for intraperitoneal, intravenous, inhalation, and oral routes, respectively. Immediately after inhalation exposure, 9.7% of the total inhaled Cd was present in the lungs. The route of administration did not significantly influence the rate of elimination and biological half-life of the second component of the whole body retention curve. (Jernigan-Vanderbilt)

METAL CONTAMINATION OF URBAN WOODY PLANTS,
Yale Univ., New Haven, Conn. School of Forestry and Environmental Studies.
W. H. Smith.
Environmental Science and Technology, Vol 7, No 7, p 631-636, July, 1973. 4 tab, 46 ref. RSA-71-20.

Descriptors: *Plant tissues, *Heavy metals, *Connecticut, *Spectrophotometry, Distribution, Cities, Rural areas, Trace elements, Statistical analysis, *Path of pollutants, Pollutant identification, *Air pollution effects, *Lead.
Identifiers: Atomic absorption spectrophotometry.

During the fall, 1970, leaf and twig tissue representing the growth of the previous growing season was collected from six woody plant species throughout the city of New Haven. Sugar maple was also sampled from remote northern New Hampshire and Vermont. These tissues were analyzed for Al, Cd, Cr, Co, Cu, Fe, Pb, Mn, Ni, Na, Sn, Zn, and V by atomic absorption spectrophotometry. Co and Sn were not detected. V was present in only a few samples from two city species. All other metals were found in all New Haven woody plants and in the sugar maples from remote areas. Cd, Cu, and Mn were present in 'normal' amounts. Al, Cr, and Ni were present in 'slightly above' normal amounts. Fe, Pb, Na, and Zn were present in 'above normal' amounts. The mean Pb concentrations exceeded most Pb concentrations determined for trees in areas with geologic Pb deposits or adjacent to primary highways. Washing and analysis with an electron microprobe failed to provide conclusive evidence with regard to the specific location of the Pb on or in the tissue sampled. (Rowe-Vanderbilt)
W74-12506

MERCURY CONCENTRATION IN THE WATER, SEDIMENTS AND FAUNA OF AN AREA OF THE TYRRHENIAN COAST,
Siena Univ. (Italy). Inst. of Comparative Anatomy.
A. Renzoni, E. Bacci, and L. Falciai.
Revue Internationale d'Oceanographie Medicale Vol 31-32, p 17-45, 1973. 6 fig, 8 tab, 43 ref.

Descriptors: *Mercury, *Water pollution sources, *Sediments, *Marine animals, Aquatic life, Distribution, Analytical techniques, *Spectroscopy, Sea water, Industrial wastes, Benthic fauna, Pollutant identification.
Identifiers: *Italy(Tyrrhenian coast), Atomic absorption spectrometry.

Mercury concentrations found in the bodies of 21 of the most common species of 4 Phyla off the Tuscan coast were studied by atomic absorption spectroscopy. The study was made in 1972-73 near the site where a chloralkali factory dumps wastes which contain mercury. Samples of water and sediments were also collected and tested for mercury concentrations. Findings were as follows: the presence of high concentrations of mercury in the water of a larger area than had been thought, reaching values as high as 204 ng/l in the most polluted station; evidence of a relationship between the mercury concentration and the size of the sediment granules; great differences in mercury content between animals and different phyla, and, within the same phylum, between groups and species; great variations in mercury concentration in different tissues of the same specimen, with consistently higher values in the visceral organs than in the muscles in all specimens of all studied species; an evident mercury accumulation in the white muscle of the small-scaled sea-scorpion; no evident mercury accumulation in the foot muscle of the limpet. (Rowe-Vanderbilt)

ZINC, COPPER, MANGANESE IN THE RAZOR CLAM, SILIQUA PATULA,
Oregon State Univ., Corvallis. Dept. of Oceanography.
J. D. Gile.
Available from the National Technical Information Service, Springfield, Va 22161 as RLO-2227-T12-34, $3.00 in paper copy, $2.25 in microfiche. M Sc Thesis, June, 1972, 52 p. 25 fig, 11 tab, 35 ref, append. (Report RLO-2227-T-12-34).

Descriptors: *Trace metals, *Clams, *Zinc, *Copper, *Manganese, Variability, Aquatic life, Analytical techniques, Spectroscopy, On-site data collections, Animal physiology, Animal metabolism, *Washington, *Oregon.
Identifiers: Siliqua patula.

Zinc, copper and manganese concentrations were measured by atomic absorption spectroscopy in Siliqua patula collected during May, 1970 through May, 1971. Individual clams were analyzed to determine the degree of variation among individuals. Statistical analysis proved the variation to be highly significant. Monthly composite samples of 18 clams were collected from three sites along the Washington-Oregon coast. The samples were analyzed to examine differences in concentration among two general groups of tissue, collection sites and monthly concentrations within a site. Copper and manganese were consistently higher in portion B (gills, liver, digestive system and reproductive tissue) and zinc was generally higher in portion A (foot, neck, mantle, adductor muscle and reproductive tissue). Variation among the three sites appears to reflect only the high degree of variability among individuals. There appeared to be a general trend of increasing concentration in Spring and Summer for all three elements. The increased concentration in Spring and Summer may be a response to increased requirements due to changes in metabolic rate brought about by increased growth and reproductive activity. Monthly variation also could be reflecting the variation among individuals. (Jernigan-Vanderbilt)
W74-12511

METALS COORDINATED BY LIGANDS NORMALLY FOUND IN NATURAL WATERS,
Haile Sellassie I Univ., Addis Abba (Ethiopia).
L. R. Pittwell.
Journal of Hydrology, Vol 21, No 3, p 301-304, March, 1974. 1 tab, 3 ref.

Descriptors: *Heavy metals, Rivers, *Carbonates, *Chlorides, *Fluorides, Solubility, Hydrogen ion concentration, Water pollution sources.
Identifiers: *Ligands.

Water, carbonate, chloride and fluoride are the main ligands responsible for keeping metals in solution in natural waters. Metals are listed by ligands and the conditions under which they are likely to be kept in solution are presented. The question of specific organic ligands is dealt with very briefly. (Jernigan-Vanderbilt)

HOW TO TROUBLESHOOT FOR COPPER LOSS IN WATER-COOLED GENERATORS,
Florida Power Corp., St. Petersburg.
R. E. Carr.
Power, Vol 117, p 53-55, June, 1973. 2 fig.

Descriptors: *Copper, *Leakage, *Powerplants, *Water cooling, Testing procedures, On-site tests, Inspection, Measurement, Industrial plants, *Florida, Thermal pollution.
Identifiers: *Crystal River(Fla).

Copper loss from stators of generators at a power plant is monitored at the deionizer through which cooling water is routed, allowing simultaneous measurement of system copper concentration and dionizer performance. The three troubleshooting techniques used to study copper loss were: (1) plotting on annual graph paper the weekly copper test results along with other important values; (2) placing a manometer on the stator cooler vent system to monitor operation of the vent systems vacuum-break and pressure relief valves with hourly readings for 6 days; and (3) researching the possible corrosion reactions for copper. Parameters deemed important for weekly measurement besides copper were pH, water-system makeup, operating service pump, and resin material. Oxygen was believed to be a main contributor to copper loss in the stator cooler system. That conclusion was based on manometer readings taken on the water storage tank vent system. Based on the results of the troubleshooting techniques, it was proposed that the vent system pressure-relief

and vacuum break valves have independent piping, with the vacuum break done through a water-seal tank. (Jernigan-Vanderbilt)

LEAD CONCENTRATIONS IN THE WOOLY SCULPIN CLINOCOTTUS ANALIS, COLLECTED FROM TIDEPOOLS OF CALIFORNIA,
California Univ., Los Angeles. Dept. of Biology.
W. P. Alley, H. R. Brown, and L. Y. Kawasaki.
California Department of Fish and Game, Fisheries Bulletin, Vol 60, No 1, p 50-51, January, 1974. 4 ref.

Descriptors: *Lead, Aquatic life, *Fish, *Tidal waters, Analytical techniques, Spectroscopy, Air pollution, *California, *Sculpins, *Path of pollutants.

The lead concentration in the muscle tissue of the wooly sculpin, Clinocottus analis, was examined for 30 fishes collected in tidepools in Southern California. The average lead values of the sculpins taken at Pt. Fermin was 4.9 ppm while the average lead level of sculpins collected at the isthmus of Santa Catalina Island was 2.7 ppm. The average lead concentrations for sculpins removed from north of San Simeon was only 0.6 ppm. The geographical variations (4.9 ppm in one area, 2.7 in another and 0.6 in a third) in lead levels undoubtedly reflect the contamination of the intertidal zone by atmospheric lead pollution. The least contaminated region easily qualifies as a rural area in that it is removed from any major metropolitan area and has not major highways passing through it. The other two areas lie close enough to Los Angeles to receive some of its atmospheric pollution. This conclusion is supported by the fact that the lead concentrations of the tidepool fishes of the area farther away are about half as great as those nearest Los Angeles but more than four times greater than the rural area. (Jernigan-Vanderbilt)

UNIVERSITY OF TORONTO STUDIES REVEAL TOXIC METALS IN SLUDGES USED FOR SOILS.
Water and Sewage Works, Vol 120, No 7, p 50-52, July, 1973. 3 tab.

Descriptors: *Cadmium, *Lead, *Sewage sludge, *Fertilizers, *Toxicity, Public health, Laboratory tests, Analytical techniques, Spectroscopy, Heavy metals, *Canada, Soil contamination, Path of pollutants, Runoff.

Recent findings at the University of Toronto indicate alarming amounts of cadmium and lead present in sewage sludge used as fertilizers for food crops. These metals may be assimilated by crops in amounts harmful to human and animal health. Jon Van Loon, an analytical chemist and professor of geology and chemistry at the university, has been examining the metallic contents of sewage sludges from treatment plants in Toronto and surrounding Ontario provinces. Van Loon and his associates examined plant life that has been grown on fields, with and without the addition of sludges. They were especially interested in cadmium and lead. Samples (measured by atomic absorption spectroscopy) were taken from three plants representing vastly different sewage influents: sewage from heavy industry region showed heavy metal values for all the elements studied; metals were low in the sewage from the residential community; high chromium content was found in the third region which contained industries which made extensive use of chrome. Van Loon sees the ground water runoff threat to water supplies as a potentially great one, in view of the fact that metals contents in fields will increase over the years. (Jernigan-Vanderbilt)

COMPARTMENTAL ANALYSIS FOR THE EVALUATION OF BIOLOGICAL HALF-LIVES OF CADMIUM AND MERCURY IN MOUSE ORGANS,
Tokyo Univ. (Japan). School of Health Sciences.
J. Matsubara-Khan.
Environmental Research, Vol 7, No 1, p 54-67, February, 1974. 5 fig, 3 tab, 32 ref.

Descriptors: *Cadmium, *Mercury, *Rodents, Distribution, *Mathematical models, Biology, Analytical techniques, Laboratory tests, Inorganic compounds, *Radioisotopes.

Repeated observations on the quantitative behavior of Cd109 and Hg203 in various mouse organs after a single injection of these tracers revealed that a clear difference of turnover characteristics exists between these nuclides, as was quantitatively determined by the compartmental analysis using electronic computer HITAC 5020. Loss patterns of Cd109 in liver, kidney, and salivary gland fitted the two-compartment model. In each organ fast and slow biological half-lives were obtained from the two observed rate constants. Data from gastrointestinal tissues or contents conformed with the one-compartment model. Loss patterns of Hg203 in most mouse organs, except brain, fitted the one-compartment model with larger rate constants which were more than 10-fold those of Cd109. By comparing the parameters obtained in the fitted exponential functions for various organs, it was possible to define the interrelationship of the metabolic flow of the elements in the different organs. In the cadmium study data from kidneys, livers, and salivary glands of subcutaneously injected animals were obtained which gave a common value for the parameter reflecting the pool size. Rate constants in kidneys and salivary glands were very small thus giving extremely long biological half-lives. Decay pattern of Cd109 for the whole body was also examined in detail. WHAT EXPLORATION GEOLOGISTS SHOULD KNOW ABOUT POLLUTION,
Texas Univ., Austin. Center for Research in Water Resources.
E. F. Gloyna.
In: Oil and Water--A Symposium, Bureau of Economic Geology, Texas University, Austin, Texas, January 29, 1965. p 25-32, (1965). 4 fig, 2 ref.

Descriptors: *Groundwater, Potable water, Economics, Public health, Water pollution, Pollution abatement, Wastes, Water pollution control, Water pollution effects, Water pollution treatment, Water quality, *Recycling, Effluents, Waste water(Pollution), Waste water disposal, Sewage disposal, Sewage bacteria, Bacteria, Coliforms, Conservation, Biochemical oxygen demand.
Identifiers: Effluent quality, *Exploration geologists.

When measured in terms of weight, water is by far the greatest resource used by man. Use per capita in the United States is greater by a large factor than all other resource uses combined. The dependency of the Southwest upon production processes and the use of great quantities of water is especially important. From now on water needs can best be met by controlling pollution. Water resources management must permit and even direct repeated reuse of the same water. This water may be diluted with relatively pure water as it flows from city to city, from industry to industry, from surface streams to underground formations, from agricultural lands to streams, from wastewater treatment plants to recreational facilities. In essence, water, the vital raw material, must be available in sufficient quantity and usable quality for purposes of furthering the state's affluent society. (Campbell-NWWA)

SIMULATION OF THE DIFFUSION OF DISSOLVED SALTS IN AQUIFERS,
California Univ., Los Angeles. School of Engineering and Applied Science.
J. A. Dracup, and W. J. Karplus.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 076; $3.00 in paper copy, $2.25 in microfiche. Completion Report, (February, 1974). 7 p, 15 ref, (California Water Resources Center Project UCAL-WRC-W-340). OWRT-B-150-CAL(14).

Descriptors: *Programming languages, *Simulation analysis, Waste water treatment, Mathematical models, Model studies, *California, *Diffusion, *Dissolved solids, Salts, Aquifers, Waste assimilative capacity, *Path of pollutants, Optimal development plans.
Identifiers: Whittier Narrows(Calif), Santee Water Reclamation Projects(Calif).

Digital simulation tools for the study of hydrologic surface water and groundwater systems have been developed. The partial differential equation language PDEL was expanded and extended to facilitate the treatment of these problem areas. PDEL is a higher-level language permitting a user untrained in computer programming to formulate and express his mathematical model in easy-to-learn formal statements. The PDEL translator then converts this program into P1/1 for further manipulation and eventual execution. A mathematical model to optimize the assimilative waste capacity of unconfined aquifers was formulated. The aquifer is used conjunctively with surface water supply sources. The waste waters are introduced into the ground water aquifer system by either well injection or by basin spreading. The model was applied to a ground water basin using data from the Whittier Narrows and Santee Water Reclamation Projects. Optimal decisions are made regarding the capacity of the waste treatment plant, the unit processes of the treatment plant, and the volume of the dilution water. (Snyder-California, Davis)

THE QUANTITY AND MOVEMENT OF NITRATES IN SOIL WATER IN TWO CONNECTICUT SOILS TREATED WITH HIGH AND LOW LEVELS OF INORGANIC NITROGEN FERTILIZER,
Connecticut Univ., Storrs. Inst. of Water Resources.
G. F. Griffin, and R. W. Wengel.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 072; $3.00 in paper copy, $2.25 in microfiche. Completion Report, 1974. 17 p, 2 fig, 6 tab. OWRT A-029-CONN(2). OWRR 14-31-0001-3807.

Descriptors: *Nitrates, *Soil water movement, Soil types, *Soil-water-plant relationships, Groundwater, *Fertilizers, Hardpan, Leaching, Sampling, *Path of pollutants, Corn(Field).
Identifiers: *Fragipan soils, Non-fragipan soils, Nitrate movement, Nitrate accumulation, Inor-

ganic nitrogen fertilizer, Potential groundwater pollution.

The quantity and movement of soil water nitrates in both a fragipan and non-fragipan soil were studied on corn land with and without added nitrogen fertilization. Particular attention was directed to determining nitrate movement along the fragipan surface, which occurs at a depth of two feet in this soil. In the three years of study no lateral movement of nitrate was detected, but movement into the fragipan was shown. Soil water nitrates attributable to field fertilization prior to the start of this study were detected at depths of two and four feet in the fragipan soil and influenced the first year results. Corn, grown for silage, reduced soil nitrate levels by the end of the growing season to levels considered safe for drinking water. (deLara-Connecticut)

OIL SPILLS: HOW SERIOUS A PROBLEM.
Journal Water Pollution Control Federation, Vol 45, No 4, p 583-585, April, 1973. 3 p.

Descriptors: *Oil wastes, *Oily water, *Water pollution control, *Water pollution effects, *Water pollution sources, Oil, Chemical wastes, Ships, Water law, Water quality control, Water Quality Act, Gasoline, Pollutants, Legislation, Administrative agencies, Project planning, Water policy, Project purposes, Adoption of practices, Administration, Oil pollution, Pollution treatment, Federal government.

The Conference on the Prevention and Control of Oil Spills contrasts the opposing views on the seriousness of the problem of oil spills. One side asserts that the danger of the spills has been grossly exaggerated. Environmentalists caution that over 80 percent of oil spilled at sea remains in the marine environment for an indefinite period even after cleanup efforts are complete. Most information about the adverse effects of oil spills is based on major reported pollution spill incidents. About 200,000 tons of oil are spilled a year from seagoing tankers. Most oil spill incidents are the result of groundings not collisions. Groundings accounted for three and one-half times more oil spilled than collisions. There is no clear correlation between tanker size and oil spill frequency. Because of its worldwide impact, the problem of tanker spills is receiving international attention. The United Nations Maritime Safety Committee has drafted proposed preventive measures against spills. A national program for oil spill control will be launched and will include regulations setting requirements for spill reporting and contingency planning with penalties and liabilities set out for infringers of the regulations. GROUNDWATER POLLUTION IN THE VICINITY OF TOLEDO BEND RESERVOIR, TEXAS,
Geological Survey, Austin, Tex.
E. T. Baker, Jr., and J. Rawson.
Open-file report, March 1974. 54 p, 12 fig, 5 tab, 6 ref.

Descriptors: *Water pollution sources, *Reservoirs, *Groundwater, *Septic tanks, *Texas, Soil disposal fields, Coliforms, Bacteria, Water quality, Path of pollutants, *Louisiana.
Identifiers: *Toledo Bend Reservoir(Tex-La).

Pollution of water in the Toledo Bend reservoir, Texas and Louisiana, by the infiltration of sewage effluent into the shallow groundwater and then into the reservoir was studied by determining the bacteriological and chemical quality of the shallow groundwater and the general direction of groundwater movement in the area bordering the Texas side of the reservoir. During the period from March 1972 to March 1973, at least 1 sample from 19 of the 22 test wells contained coliforms, and at least 1 sample from 16 wells contained more than 1,000 coliform colonies per 100 milliliters. At least 1 sample from 8 of the 22 test wells contained fecal coliforms. Samples from 2 wells contained more than 100 fecal-coliform colonies per 100 milliliters. At least 1 sample from 12 of the 22 wells contained streptococci. Samples from six wells contained both streptococci and fecal coliforms. Most of the monitoring sites where fecal coliforms were detected in the groundwater are at commercial developments. The probable source of the pollution is effluent from the septic tanks. The low densities of fecal coliforms and streptococci in water from most of the wells indicate that the pollutants contributed to the shallow groundwater and thence to Toledo Bend Reservoir by effluent from the septic-tank systems are also low. However, if development in the reservoir area continues at a rapid pace and septic tanks are used for the disposal of wastes, the pollution level can be expected to increase rapidly in some areas. (Knapp-USGS)

RELATION OF CLIMATE TO LEACHING OF SOLUTES AND POLLUTANTS THROUGH SOILS,
Wisconsin Univ., Madison. Dept. of Soil Science.
C. B. Tanner, and W. R. Gardner.
Available from NTIS, Springfield, Va. 22161 as COM-73-11225, Price $4.25 printed copy, $2.25 microfiche. Report to National Oceanic and Atmospheric Administration, Environmental Data Service, June 5, 1973. 48 p, 12 fig, 12 tab, 26 ref. NOAA Grant NG-34-72.

Descriptors: *Leaching, *Path of pollutants, *Irrigation effects, *Nitrates, Soil water movement, Translocation, Climatology, Weather data, Evapotranspiration, *Climates.

For subhumid and semiarid regions a simple model of nitrate leaching was combined with an analysis of weather records to give a construction of annual nitrate peaks in deep soil profiles and the rate at which the nitrate moves to the water table. The model is applicable to humid as well as arid regions. However, the annual nitrate peaks are so widely spaced in humid regions and groundwater tables often are so close to the surface that soil coring would not be definitive. Therefore lysimeter data are required in humid regions. (Knapp-USGS)

HEALTH HAZARDS OF THE HUMAN ENVIRONMENT.
World Health Organization: Geneva, Switzerland, 1972. 387 p. Illus. Paper. Pr. $11.00.

Descriptors: *Public health, Air pollution, Water pollution, *Diseases, Ecology, Soil contamination, Pesticides, Radiation, *Environment, Hazards.
Identifiers: Carcinogens, Teratogens.

A summary is presented of current knowledge of health hazards in the human environment. In part 1, environmental hazards are considered in relation to such environmental aspects as air, water, food, soil, land, home and place of work. Part 2, discusses specific chemical contaminants and physical hazards in the environment. Mutagens, carcinogens, teratogens and pesticides are included. The problems involved in interpreting laboratory tests are described. In part 3, the development of a world system of surveillance and monitoring of environmental factors affecting health is discussed. Environmental parameters, environmental radiation, communicable diseases, indices of nutritional status, congenital malformations, chromosome aberrations, biochemical profiles, adverse reactions to drugs, cancer, domestic and wild animals, and systems analysis and control are included. In part 4, measures for dealing with environmental health hazards are described. The development of general criteria and standards is important. The role of basic sanitation in solving many problems in the control of communicable diseases and some indications of the ways in which advanced technology could be used for controlling certain pollutants and nuisances are discussed. The book will interest environmentalists, ecologists and anyone interested in environmental problems.--Copyright 1973, Biological Abstracts, Inc.

LOSSES OF NITROGEN AND OTHER PLANT NUTRIENTS TO DRAINAGE FROM SOIL UNDER GRASS,
Grassland Research Inst., Hurley (England).
E. A. Garwood, and K. C. Tyson.
J Agric Sci. Vol 80, No 2, p 303-312, 1973.

Descriptors: *Transpiration, Lysimeters, Nitrates, Runoff, *Grasses, *Perennial ryegrass, Drainage, Leaching, *Nitrogen, Nutrients.
Identifiers: Grass, Plant, Potential, Soil.

Drainage lysimeters were used to estimate actual transpiration of a perennial ryegrass sward; this is compared with the calculated values for potential transpiration. Losses to drainage of NO3-N under differing levels of application of N fertilizer were examined. When 250 kh N/ha were applied annually, losses of NO3-N were negligible; when 500 kg N/ha were applied, up to 142.9 kg N/ha were lost to drainage. Concentration of NO3-N in the leachate with an application of 250 kg N/ha was low (1-5 ppm); with 500 kg N/ha the concentration ranged 10-109 ppm. Losses of NO3-N were particularly severe during winter following a dry autumn. When drainage occurred during the growing season losses were minimal. Concentrations and quantities of K, Ca, Mg, Na, P, Cl and S (as sulfate) leached were also examined.--Copyright 1973, Biological Abstracts, Inc.

NITRATES, NITRITES; THEIR RELATIONSHIP TO ANIMALS, MAN: IV. FACTORS CAUSING A CONCENTRATION IN FODDER CROPS OF NITRATES, NITRITES: THEIR DEPENDENCE UPON ECOLOGICAL FACTORS; TIME OF STORAGE, (IN GERMAN),
Institut fuer Immunobiologie, Berlin (East Germany).
H. Liebenow.
Arch Tierernaehr. Vol 21, No 8/9, p 635-648. 1971. Illus. (English summary).
Identifiers: Beans, Beets, Cocksfoot, Crops, Ecological studies, Fodder, Grass, Maize, Meadow, *Nitrates, *Nitrites, Oats, Rye, Sunflower, Time, Vetches.

Over the experimental period from 1962-1967 the content of nitrates in the dry matter of irrigated grasses averaged 1.2% while that of non-irrigated grasses averaged 0.8%. The average values obtained for each of the 6 yr varied between 0.6% and 1.7% in the case of irrigated grass and ranged from 0.2%-1.4% in the case of non-irrigated grass. In the years 1964-1965 when high concentrations of nitrates were observed the percentage content of nitrates in irrigated grass obtained from a number of irrigation plots was found to be as high as 5.4% that of non-irrigated grass 3.1%. Ten different species of fodder crops which were grown in the years 1965-1967 on the average contained from 0.09%-1.2% of nitrates if the crops were under irrigation and from 0.09%-0.89% if the crops were not irrigated. The largest stores of nitrates were found in oats, sun-flower and fodder beets; smaller concentrations were contained in ryegrass, cocksfoot and stalked meadow grass while the smallest amounts of nitrates were found in maize, lucerne, vetches and fodder beans. Nitrites were found sporadically; the content of nitrites varied between 0.09 mg% and 11.6 mg% in irrigated grass and between 19.4 mg% and 301 mg% in sunflower. The following factors increased the nitrate content: cold weather, storage in stacks, drying between 80C and 120C resulting in a 11-24% increase.--Copyright 1973, Biological Abstracts, Inc.

A SURVEY OF UNIQUE TECHNICAL FEATURES OF THE FLOATING NUCLEAR POWER PLANT CONCEPT.
Directorate of Licensing (AEC), Washington, D.C.
Available from NTIS, Springfield, Va 22161 as Rept No WASH-1304; $5.45/copy, $2.25/microfiche. Report No WASH-1304, March 1974. 111 p, 2 fig, 4 tab, 13 ref.

Descriptors: *Nuclear powerplants, Floating, *Oceans, *Sites, *Safety, Evaluation, *Surveys, Offshore platforms, Environmental effects, Accidents, Hazards, Transportation.
Identifiers: *Floating nuclear powerplants.

The manufacture, installation, operation, and decommissioning of floating nuclear power plants at offshore sites are examined with respect to the major technical differences between such plants and land-based nuclear power plants. Anticipated environmental effects of activities associated with offshore nuclear plants are discussed. Possible accidents, both inplant and during the transport of radioactive materials to and from an offshore plant, are described and an initial estimate of their relative significance presented. (Houser-ORNL)

TEMPERATURE EFFECTS ON THE SORPTION OF RADIONUCLIDES BY AQUATIC ORGANISMS,
Du Pont de Nemours (E.I.) and Co., Aiken, S.C. Savannah River Lab.
R. S. Harvey.
Available from NTIS, Springfield, Va 22161 as DP-MS-73-8; $4/copy, $2.25/microfiche. Report No DP-MS-73-8, (May 1973). 20 p, 7 fig, 4 tab, 6 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Radioactivity, *Thermal pollution, *Thermal radiation, *Temperature, *Aquatic environment, *Environmental effects, Aquatic plants, Aquatic animals, Radioecology, Biota, Streams, Aquatic algae, Shrimp, Larvae, Sorption, Cesium, Strontium, Zinc, *South Carolina.
Identifiers: *Savannah River Plant(So Car).

The warm waters of the reactor effluent streams within the Savannah River Plant are sufficiently cooled to support diverse populations of aquatic organisms prior to their confluence with the river. Indigenous species of plants and animals are being studied in the laboratory to determine their role in the fate of radionuclides discharged to the freshwater environment. The effects of water temperature changes on the growth of algae, midge larvae and freshwater shrimp, and their ability to sorb radioactive materials are reported. (Houser-ORNL)

RADIOACTIVITY AND HUMAN DIET.
Pergamon Press, Oxford, Great Britain, 1966. R. S. Russell, editor. 552 p, $15.00.

Descriptors: *Radioactivity, *Diets, *Foods, *Toxicity, *Food chains, Biology, Biological degradation, Biological treatment, Strontium, Cesium, Iodine, Air pollution, Fallout, Water pollution, Soil contamination, Path of pollutants, Transfer.

When radioactive materials are deposited from the atmosphere so that both the land and water are contaminated, agricultural crops or animal produce are the principal sources of radioactivity in human diet; by comparison the contribution of fish and other foods produced in water is small. Thus the major emphasis in this book is given to the mechanisms by which radioactive materials enter man's diet after they have been deposited on growing plants or have entered the soil. These subjects are introduced in Part II, which describes the relevant aspects of soil chemistry and of the physiology of plants and animals. Subsequently, in Parts III and IV the behavior of individual nuclides in each step of the food chain is considered. The relative contributions of different foods to the total dietary intake under different circumstances are discussed, and when possible quantitative relationships are suggested. The greatest attention is given to strontium-90, both because of the complexity of the factors which control its entry into diet and magnitude of the radiation doses which it may deliver. In Part V the general nature of food chains in fresh water and the sea are described. This information is relevant to assessing the effects of liquid radioactive effluent which is discharged from nuclear establishments, but the types of situation which may then arise cannot be predicted in the detailed manner which is often possible when fission products are deposited on the surface of land. The local circumstances at the point where effluent is discharged may vary so widely that an independent evaluation may be necessary in each case. (See W74-12050-12051) (Houser-ORNL)

FOOD CHAINS IN FRESH WATER,
Battelle-Pacific Northwest Lab., Richland, Wash. Biology Dept.
H. A. Kornberg, and J. J. Davis.
In: Radioactivity and Human Diet, p 385-418, 1966. 4 fig, 8 tab, 87 ref.

Descriptors: *Radioactivity, *Potable water, Aquatic environment, *Path of pollutants, *Adsorption, *Absorption, Transfer, *Ion exchange, *Food chains, *Diets, Toxicity, Human population, Water users, Public health, Surface waters, Aquatic life.

The introduction of radioactive materials into inland waters may create special problems due to the unique characteristics of aquatic environments. Because of rapid and selective adsorption and assimilation of radioactivity, surface waters containing levels of nuclides permissible for drinking purposes may support aquatic organisms containing concentrations of radionuclides that would not be tolerable for human consumption. However, no radiation effect on aquatic organisms resulting from radioactive materials present in natural bodies of fresh water has been demonstrated. It is usually assumed that if the water is safe for drinking and producing food, no significant effects will accrue to biological communities living in it. The primary problems that arise when radionuclides are introduced into populated surface waters are those caused by their transfer among members of aquatic communities and eventually to man. Aquatic environments and the factors that affect them are discussed. The fate of radioactive substances in aquatic communities is outlined, and examples are cited of field surveys done where artificial nuclides have been introduced into natural bodies of water. (See also W74-12049) (Houser-ORNL)
W74-12050

FOOD CHAINS IN THE SEA,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco).
W. A. Chipman.
In: Radioactivity and Human Diet, p 419-453, 1966. 2 fig, 6 tab, 67 ref.

Descriptors: *Oceans, *Seas, *Sea water, *Radioactivity, *Food chains, *Toxicity, *Public health, *Human population, Water users, Diets, Marine life, Fish, Foods, Sorption, Adsorption, Absorption, Transfer, Ion exchange, Aquatic environment, Environmental effects, Radioactivity effects.

The oceans and seas furnish sites for recreation, and are an important source of food, marine products for agriculture and industry, salts and minerals. The extensive sea fisheries of various nations give significant amounts of protein foods to the diet of man. Naturally occurring radioactive isotopes have always been present in the sea but the exploitation of atomic energy for military and peaceful uses has led to appreciable increases in its radioactivity. It has therefore become necessary to consider the effects of man-made radioactive substances both on marine organisms and on marine foods which man consumes. A description is presented of the oceans as an environment for marine life, the addition of radioactive materials to the sea from the use of atomic energy, uptake of radionuclides by organisms in the marine environment, and possible exposure of the population from radioactive contamination of fish and seafoods. ECOLOGY OF THE EULITTORAL ZONE OF LAKES,
Warsaw Univ. (Poland). Zoological Inst.
E. Pieczynska.
Ekol Pol. Vol 20, No 44, p 637-732, Illus, 1972.
Identifiers: Allochthonous matter, Autochthonous production, Ecology, Environmental effects, Erosion, Lakes, *Littoral, *Poland(Masurian lakes), *Eulittoral zone.

Environmental conditions and biological processes in the eulittoral--intermediate zone between the lake and the surrounding land were analyzed. Investigations were carried out on 16 lakes (eutrophic, mesotrophic and dystrophic) of the Masurian Lakeland in northern Poland. The range of eulittoral, depending on the water level fluctuation and configuration of the shore terrace, is to a considerable extent modified by the erosion and accumulation processes. Allochthonous matter (of lake and terrestrial origin) and autochthonous production are the sources of organic matter in the eulittoral. The decomposition rate of this kind of matter was analyzed. The role of the eulittoral in the functioning of the lake system was discussed.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF GRANULATED DDT USED IN MOSQUITO CONTROL ON WATER ORGANISMS, (IN RUSSIAN),
Institute of Medical Parasitology and Tropical Medicine, Moscow (USSR).
M. G. Trofimova, and A. M. Mitrofanov.
Med Parazitol Parazit Bolezn. Vol 41, No 5, p 620-622, Illus, 1972. English summary.
Identifiers: Aedes-spp, *Chironomidae, Cladocera, Copepods, *DDT, Ecology, Environmental effects, *Mosquito control, Organisms, Water pollution effects, *Toxicity.

DDT (10% granulated) was used for control of larvae of mosquitoes of the genus Aedes. After aerial treatment of water reservoirs 100% death of larvae occurred in 24 h. Specimens for determination of DDT content in the water (surface and bottom layers), vegetation and soil were taken before and after treatment several times during 1 mo. According to chemical analyses, DDT was not found either in the superficial layer of water or in the water vegetation. The content of DDT in the bottom layer and silt varied from 0.001-0.007 mg/l and from 0.5-1.1 ml/kg, respectively. Observations of the population densities of hydrobionts in treated water reservoirs showed the organisms distributed in the thickness of water (Copepods and Cladocera) to be beyond the zone of toxic effect of granulated DDT, whereas the bottom Chironomidae died after introduction of the drug into the water reservoir.--Copyright 1974, Biological Abstracts, Inc.

SEASONAL AND ANNUAL PHYTOPLANKTON CHANGES IN CHIVYRKUISKII BAY, LAKE BAIKAL, (IN RUSSIAN),
Limnologicheskii Institut, Irkutsk (USSR).
G. I. Popovskaya.
Gidrobiol Zh. Vol 9, No 5, p 5-11, 1973. English summary.
Identifiers: *Algae, Annual, Biomass, *Diatoms, Lakes, *Phytoplankton, *Seasonal, *USSR(Lake Baikal), *Cyanophyta.

Data are presented on the species composition, seasonal and interannual dynamics of phytoplankton; 125 forms of algae were found. Their annual distribution is characterized by 3 maxima, spring and autumn being formed by diatoms, the summer one (the highest) by blue-green algae. The biomass oscillations from year to year are much smaller in the bay than in the Baikal (USSR) pelagic zone.--Copyright 1974, Biological Abstracts, Inc.

DETRIMENTAL EFFECTS OF TOXICAL CHARGE BY HEAVY METALS OR PHENOL ON SUBMERGED MACROPHYTES (FONTINALIS ANTIPYRETICA L.), (IN GERMAN),
Technische Universitaet, Dresden (East Germany). Bereich Hydrobiologie.
S. Auerbach, P. Pruefer, and G. Weise.
Int Rev Gesamten Hydrobiol. Vol 58, No 1, p 19-32, Illus, 1973. English summary.
Identifiers: Cadmium, *Carbon dioxide exchange, Copper, *Fontinalis-antipyretica, *Heavy metals, *Macrophytes(Submerged), Mercury, *Phenols, Productivity, *Toxicity, Water pollution effects, Infrared analysis, Water moss.

The water moss F. antipyretica L. is well suited for measuring CO_2 exchange by IR gas analysis (IRGA), as only CO_2 is used for assimilation. Both in a state of full activity and of reduced activity in the course of a toxic charge the ratio of net primary productivity to respiration related to intermittent illumination is used as a bioassay. Three types regarding the proportion of net assimilation (AN) to respiration (RD) are referred to the toxic charge (phenol, $HgCl_2$, $CuSO_4$, $CdCl_2$). In the case of displacing the balance of AN/RD in the diurnal cycle to the side of respiration, photosynthetic oxygenation in the water ecosystem decreases. The combination of measuring CO_2 exchange by IRGA with a cyto-physiological investigation by determining the time of deplasmolysis of leaves is used for the prediction of vitality long before damage including lethal effects are recognized morphologically.--Copyright 1974, Biological Abstracts, Inc.

MICROBIOLOGICAL OXIDATION OF HYDROGEN SULFIDE IN THE REPNOE LAKE (SLAVONIC LAKES), (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Mikrobiologii.

V. M. Gorlenko, E. N. Chebotarev, and V. I. Kachalkin.
Mikrobiologiya. Vol 42, No 4, p 723-728, Illus, 1973. English summary.
Identifiers: Chlorobium-phaeovibrioides, Growth rate, *Hydrogen sulfide, Lakes, *Light intensity, Microbiological studies, *Oxidation, Photosynthesis, *Sulfur bacteria, *USSR(Repnoe Lake), Phototrophic.

Oxidation of H2S in the water of the Repnoe lake, USSR, was mainly due to the activity of phototrophic sulfur bacteria. Chlorobium phaeovibrioides dominated (33.1,000,000 cells/ml). The maximal rate of the bacterial photosynthesis (160 microgram/C/l/day) was registered at a depth of 5.5 m at the boundary of the H2S zone. Low light intensity was the main factor limiting growth of the phototrophic sulfur bacteria.--Copyright 1974, Biological Abstracts, Inc.

THERMAL EFFECTS OF A NUCLEAR POWER PLANT ON THE MISSISSIPPI RIVER AT MONTICELLO, MINNESOTA,
Saint Cloud State Coll., Minn. Dept. of Biology.
A. J. Hopwood.
Available form the National Technical Information Service, Springfield, Va 22161 as PB-235 833, $4.75 in paper copy, $2.25 in microfiche. Minnesota Water Resources Research Center, St. Paul, July 1974. Bulletin 19. 134 p, 53 fig, 30 tab, 23 ref. OWRT B-032-MINN(3). 14-31-0001-3097.

Descriptors: *Thermal pollution, *Lotic environment, *Fish populations, Benthos, *Minnesota, *Mississippi River, *Nuclear powerplant, Mayflies, Diptera, Invertebrates, *Aquatic insects, Water pollution effects.
Identifiers: Monticello(Minn), Trichoptera.

The thermal effects of the nuclear power plant at Monticello, Minnesota were assessed by comparing postoperational (1971-1972) data to baseline data (1968-1971) on the Mississippi River. Macroinvertebrate samples from artificial substrates placed upstream were compared to those from the heated zone downstream. Trichopteran biomass increased, ephemeropterans and dipterans decreased in the heated zone. Significant responses to heated water were observed for Trichoptera in the July-October period, Ephemeroptera were most affected in the May-August period, Dipterans declined significantly during September through November. The number of species was not affected by the heat. Growth rates of macroinvertebrate groups in upstream and downstream areas were not significantly different in four of seven 35-day cycles observed. A comparison of the number of fish caught by electrofishing along the oposite sides of the river showed that black crappies, smallmouth bass, and walleyes were more numerous on the heated side, and were often attracted to the discharge canal from adjacent areas of the river. Rough fish were generally indifferent to the heated water in most areas, but carp were more attracted by the discharge canal than other species. Normal movements of minnows and other population characteristics seemed unaffected by the temperature rise. Effects of the power plant upon other organisms, such as birds have been minor. (Walton-Minnesota)

STUDIES ON THE EFFECTS OF SEWAGE EFFLUENT ON SELECTED GROUPS OF ARTHROPODS AND PHYTOPATHIC NEMATODES.
Michigan State Univ., East Lansing. Dept. of Entomology.
Available from National Technical Information Service, Springfield, Va 22161 as PB-235 823, $3.00 in paper copy; $2.25 in microfiche. Completion Report (September 1974). 14 p, 5 tab, 5 ref. OWRT A-074-MICH(1), 14-31-0001-4022.

Descriptors: *Nematodes, *Sewage effluents, Cores, Water pollution effects, *Michigan, Mosquitoes, Irrigation, Water quality, *Insects.
Identifiers: *Water quality management projects, Sewage effluent irrigation, Biting flies, Small mammals, *Arthropods, Seriological surveys, Haematrophagous insects, Phytopathic nematodes.

Results are presented of a one year study conducted at the Michigan State University Water Quality Management Project in East Lansing, Michigan. The primary objective of the study was to obtain pre-operational baseline data that could be used as points of reference in planned studies to determine the long term effects of this sewage irrigation project on the maematophagous insects, soil microarthropods and phytopathic nematodes in the project site. This included specific efforts to identify the haematrophagous insects that were indigenous to the project area, to assess their potential as human or animal pests and/or disease vectors, and to identify and categorize the soil microarthropods and phytopathic nematodes that now are present in the proposed irrigation plots and the areas adjacent to the water impoundments constructed for the project.

CULTURING AND ECOLOGY OF DIAPTOMUS CLAVIPES AND CYCLOPS VERNALIS,
Univ. of Oklahoma, Norman. Dept. of Zoology.
A. Robertson, C. W. Gehrs, B. D. Hardin, and G. W. Hunt.
Copy Available from GPO Sup Doc as EP1.23:660/3-74-006, $2.55; microfiche from NTIS, Springfield, Va 22161 as PB-234 613, $2.25. Environmental Protection Agency Ecological Research Series Report, EPA-660/3-74-006, April 1974. 226 p, 18 fig, 5 tab, 70 ref, 8 append. EPA Program Element 1BA021, 18050 ELT.

Descriptors: *Copepods, *Water temperature, Aquatic populations, *Bioassay, Crustaceans, Animal ecology, Zooplankton, Food abundance, Laboratory animals, Environmental effects, Reproduction, *Temperature resistance, Thermal pollution, Water pollution effects.
Identifiers: *Diaptomus clavipes, *Cyclops vernalis, Laboratory culturing, Temperature relations, Food relations, Population dynamics, Life tables.

Results are presented of studies undertaken to develop a method maintaining healthy self-propagating, laboratory cultures of the freshwater calanoid copepod, Diatomus clavipes. Recommendations are given as to container size, type of culture medium, light conditions, temperature conditions, food type and quantity, frequency of replacement medium, and amount of disturbance suggested for culturing. The results of a study dealing with effects of temperature on certain reproductive attributes of this species are presented. Temperature is shown to affect the longevity of the adult females as well as the size, carrying time, and probably total lifetime production of clutches. The results indicate that certain of the reproductive attributes of the females are affected by the temperature of early life as well as the acclimation temperature. Results are included of a study on the dynamics of a field population of D. clavipes. The durations of the various life history stages were estimated both from laboratory and field data. Life tables were constructed for the spring generation of this population as well as all generations in a reproductive year combined. The states of greatest relative mortality were identified. Recommendations are presented for culturing the cyclopoid copepod, Cyclops vernalis, and the results of studies concerning effects of temperature on certain reproductive attributes of this species are included. Descriptors: *Phytoplankton, *Nutrients, *Lake Ontario, *Zooplankton, Phosphorus, Mathematical models, Environment, Great Lakes, Data collections, Cladophora, *Eutrophication, Remote Sensing, Algae.
Identifiers: Genesee River(N.Y.), Near shore environment, *Hazardous materials.

The field data collection phase of an intensive multidisciplinary study of Lake Ontario was conducted in 1972-73 by agencies of the United States and Canada. The scientific program was designed to further the basic scientific knowledge of the Great Lakes, to provide the basis for improved water quality and quantity management, and to comprehend the broad impact of the lake on the environment of the Great Lakes Basin. The Chemistry-Biology Program had three major objectives--material balance studies, evaluation of the current ecologic status of the lake, and the development of predictive mathematical models. The chemistry program was conducted at the Rochester Field Office of Region II. The biologically related studies were mainly performed through ten grants administered by the Grosse Ile Laboratory. This document brings together the annual reports prepared by the Grantees. It is hoped that distribution of these annual reports will provide for a more complete analysis of the data collected during International Field Year for the Great Lakes (IFYGL). (Thomas-EPA)

PHYTOPLANKTON NUTRITION AND PHOTOSYNTHESIS IN LAKE MINNETONKA AND LAKES AT FAIRMONT, MINNESOTA,
Minnesota Univ., Minneapolis. Dept. of Ecology and Behavioral Biology.
R. O. Megard.
Available from the National Technical Information Service, as PB-235 906, $3.75 in paper copy, $2.25 in microfiche. Minnesota Water Resources Research Center, Univ. of Minn., St. Paul, Mimeographed Rept. 64 p, 29 fig, 16 tab, 27 ref. OWRT A-026-MINN(3).

Descriptors: *Phytoplankton, *Photosynthesis, *Lakes, *Minnesota, Dissolved solids, Chlorophyll, Phosphorus, Water pollution effects, Water quality control.
Identifiers: *Lake Minnetonka(Minn), Lake pollution, Lake rehabilitation, Organic carbon.

Abundance of phytoplankton, rates of photosynthesis, concentrations of dissolved substances and other limnological features of Lake Minnetonka, near Minneapolis, and of five lakes near Fairmont, Minnesota, were studied. Lake Minnetonka is a large lake with many basins located in suburban Minneapolis, whereas the lakes at Fairmont are in an agricultural watershed near the Minnesota-Iowa border. Fluctuations of population densities of phytoplankton in 4 basins of Lake Minnetonka were inferred from changes of concentrations of chlorophyll a and particulate organic carbon (POC) during the ice-free season. Concentrations of chlorophyll a during 1972 and 1973 were similar to those during 1968 and 1969 except in the lake's largest basin, where concentrations during 1972 and 1973 were only about 50% as high as during 1968 and 1969. The decrease of chlorophyll is attributable to the reduced influx of phosphorus, which decreased from about 13 metric tons/year because sewage effluents were diverted away from the basin during the winter of 1971-72. The decrease of chlorophyll coincided with lower concentrations of total phosphorus. Population densities of phytoplankton in the 5 lakes at Fairmont, in southern Minnesota are higher than in Lake Minnetonka. Concentrations of dissolved phosphorus must be reduced substantially before it begins to regulate algal abundance in the Fairmont Lakes. (Walton-Minnesota)

LEVELS OF COBALT, CESIUM AND ZINC IN SOME MARINE ORGANISMS IN JAPAN,
National Inst. of Radiological Sciences, Chiba (Japan). Div. of Environmental Health.
R. Ichikawa, and S. Ohno.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 40, No 5, p 501-508, May 1974. 2 tab, 13 ref.

Descriptors: *Bioassay, *Absorption, *Zinc, *Cobalt, *Cesium, *Marine fish, Metals, Path of pollutants, Food chains, Heavy metals, Industrial wastes, Neutron activation analysis, Analytical techniques, Methodology, Smelts, Shrimp, Mollusks, Water pollution effects.
Identifiers: Flounder, Dolphin, *Japan.

Skine, muscle, viscera and bone of various species of marine fishes were analyzed by the neutron activation method to determine cobalt, cesium and zinc concentrations. Muscle contains much less cobalt and zinc than do the other tissues, whereas cesium is distributed rather uniformly in all of these tissues. The soft part of the short-necked clam showed much higher concentrations of the three elements than did fish muscle. Cobalt and zinc levels in shrimp (soft part and carapace), sea urchin (ovary) and see cucumber (whole body) are high than those in fish muscle, but the cesium level in these animals is somewhat lower than in any fish tissues. The concentration factors of cobalt, cesium and zinc were calculated for various tissues of animals by using the average concentration of the elements in sea water. Values of concentration factors for the animals analysed are in the range of 10 for cesium, 102 for cobalt and 103 for zinc, with some exceptions. (Katz)

S. Kimura, H. Kumada, and Y. Matida.
Bulletin of Freshwater Fisheries Research Laboratory, Vol 23, No 2, p 115-123, December 1973. 5 tab, 12 ref. English synopsis.

Descriptors: *Polychlorinated biphenyls, *Absorption, *Carp, *Rainbow trout, Chlorinated hydrocarbon pesticides, Pesticides, *Toxicity, Bioassay Lethal limit, Food chains, Algae, Freshwater, Aquatic animals, Path of pollutants, Water pollution effects.
Identifiers: *TLm, Accumulation, Guppy, Goldfish, Carassius ssp., Cyprinus carplo.

Acute toxicity of PCB to freshwater fish was evaluated, and preliminary experiments were conducted to estimate the accumulation of this compound by freshwater organisms. The PCB tested was KC 300 (trichlorinated form). The 96 hr TLm value of KC 300 for carp fry, guppy fry and adult female guppy were 1.45, 0.9 and 3.2 ppm, respectively. Goldfish and dace accumulated KC 300 directly from water and their concentration factors ranged from 2,000 to 3,000. The residue concentration in surviving female guppies exposed to the 96 hr TLm for 96 hours was 4,000 ppm (wet basis), and the concentration factor was above 1,000. Rainbow trout fingerlings were fed a mixture of fish food and feed oil containing KC 300 for 6 weeks and accumulated approximately 35% of the compound administered. The accumulation of KC 300 through a food chain was unclear and further studies are needed to confirm which pathway, whether through the food chain or directly from environmental water, contributes to the magnification of PCB by fish in natural water bodies. MINERAL FERTILIZATION OF CARP PONDS IN POLYCULTURAL REARING,
Institut fuer Suswasserfischzucht, Plovdiv (Bulgaria).
M. Dimitrov.
Aquaculture, Vol 3, No 3, p 273-285, 1974. 3 tab, 2 fig, 18 ref.

Descriptors: *Aquiculture, *Fertilization, *Biomass, *Productivity, Carp, Fish farming, Fisheries, Productivity, Nitrogen compounds, Phosphorous compounds, Zooplankton, Benthos, Dissolved oxygen, Nutrient requirements, Environmental effects, Animal growth, Diptera, Oligochaetes, Copepods, Primary productivity, Food chains.
Identifiers: Superphosphate, Cladocera, Rotatoria.

Polycultural carp growing using intenstive mineral fertilization (weekly and every 3 days) was examined. The greatest zooplankton and benthos biomass and the greatest fish growth per ha water area were obtained with 3-day mineral fertilization with ammonium nitrate, 708 kg/ha, and superphosphate, 395 kg/ha. The highest average season zooplankton biomass in mixed fertilization (mineral and organic) is 2.437 g/m3. The highest average seasonal biomass of the benthos is established with three-day mineral fertilization, 1.472 g/m2. The total fish growth with three-day fertilization is 300 kg/ha higher than in the control ponds, without fertilization. The best fishery results have been achieved with three-day fertilization giving a total growth of the fish of 2,730 kg/ha and a food coefficient of 2.8. (Katz)
W74-12246

DEAD POPULATIONS OF FISH IN THE RIVERS JORDAN AND ZARQA,
Jordan Univ., Amman. Basic Medical Sciences.
M. J. Haddadin, and A. A. Alawi.
Biological Conservation, Vol 6, No 3, p 215-216, 1974. 1 fig.

Descriptors: *Analytical techniques, *Fishkill, *Pesticides, *Insecticides, Spectrophotometry, Toxicants, Carp, Organophosphorous, Poisons, Animal pathology, Water pollution effects, Pollutant identification.
Identifiers: *Parathion, Gills, *Amman(River Jordan), *Amman(River Zarqa).

Large numbers of dead fish in the Rivers Jordan and Zarqa in March 1973 suggested poisoning by insecticide. Spectrophotometry of extracts from fish gills and liver indicated that the probable was Parathion in a fine suspension. (Katz)

LONG-TERM CHANGES IN THE SETTLEMENT OF BARNACLES IN THE MIAMI AREA,
Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
H. B. Moore, H. D. Albertson, and S. M. Miller.
Bulletin of Marine Science, Vol 24, No 1, ; 86-100, 1974. 10 fig, 10 ref.

Descriptors: *Crustaceans, On-site investigations, *Florida, Environmental effects, *Temperature, *Sewage, Pollution, Water pollution effects, Hurricanes, Population, Invasion, Methodology, Discharge(Water), Seasonal, Oysters, Algae, Benthic fauna, Benthos.
Identifiers: *Barnacles, *Settlement rates, Balanus ssp., *Miami Beach(Florida), Cypris.

Daily and monthly counts of barnacle settlement rates on test panels at Miami Beach are presented for the years 1943 to 1970. The effects of various environmental factors, such as water temperature, river discharge, sewage pollution, and hurricanes upon the barnacle populations of the test panel are also discussed. Changes in the species composition due to the immigration of two species of barnacles new to the Miami area are also documented. In addition, barnacle settlement is considered in relation to populations of other fouling organisms found on the panels. (Katz)

THE EFFECTS OF ENVIRONMENTAL STRESS ON OUTBREAKS OF INFECTIOUS DISEASE OF FISHES,
Eastern Fish Disease Lab. Bureau of Sport Fisheries and Wildlife, Kearneysville, W. Va.
S. F. Snieszko.
Journal of Fish Biology, Vol 6, No 2, p 197-208, 1974. 1 fig, 4 tab, 50 ref.

Descriptors: *Fish diseases, *Water pollution effects, *Stress, *Reviews, Diseases, Animal pathology, Environmental effects, Toxicants, Water chemistry, Aquatic environment, Infection, Temperature, Thermal stress, Thermal pollution, Oxygen, Dissolved oxygen, Supersaturation, Nitrogen, Eutrophication, Sewage, Biological Oxygen Demand, Metabolism, Industrial pollution, 2,4-D, Pesticides, Publications.
Identifiers: Metabolic wastes.

Infectious diseases of fishes occur when susceptible fishes are exposed to virulent pathogens under certain environmental stress conditions. Very little research has been carried out to show the effect of pollution on outbreaks of infectious diseases of fishes. Examples taken from the literature were selected and reviewed to show the coincidence of infectious diseases with stress caused by temperature, eutrophication, sewage, metabolic products of fishes, industrial pollution and pesticides. (Katz)

SOME PARTICULATE AND SOLUBLE AGENTS AFFECTING THE RELATIONSHIP BETWEEN METAL TOXICITY AND ORGANISM SURVIVAL IN THE CALANOID COPEPOD EUCHAETA JAPONICA,
British Columbia Univ., Vancouver. Inst. of Oceanography.
A. G. Lewis, P. H. Whitfield, and A. Ramnarine.
Marine Biology, Vol 17, No 3, p 215-221, 1972. 1 fig, 3 tab. 20 ref.

Descriptors: *Copepods, *Toxicity, *Chelation, *Resistance, Clay minerals, Sediments, Plankton, Metals, Diatoms, Sewage effluents, Trace metals, Methodology, Soils, Phytoplankton, Adsorption.
Identifiers: *Euchaeta japonica, Ascorbic acid, Humic acids, Particulates, Metal-binding capability.

Particulate and water-soluble agents were tested to determine their ability to affect the relationship between metal toxicity and the survival of Euchaeta japonica (Copepoda, Calanoida). Clay minerals and diatoms were two types of particles capable of affecting this relationship. Ascorbic acid, sewage effluent, and water extracts of humic acid and two types of soils exhibited the same capability. The ability of the water-soluble agents was compared to that of a known chelating agent in an attempt to quantify the activity of the agents. (Katz)

EFFECTS OF AERATION IN EARTHEN PONDS ON WATER QUALITY AND PRODUCTION OF WHITE CATFISH,
South Carolina Agricultural Experiment Station, Clemson.
H. A. Loyacano.
Aquaculture, Vol 3, No 3, p 261-271, 1974. 2 fig, 3 tab, 5 ref.

Descriptors: *Water quality, *Catfishes, *Aeration, Chemical oxygen demand, Water properties, Oxygen demand, Fish farming, Fish management, Methodology, Aquiculture, Dissolved oxygen, Growth rates, Productivity, Water chemistry.

Comparing effects of air volumes of zero, 6.9 and 10.4 m3/min per ha (0, 100 and 150 ft3/min per acre) indicated that greater volumes of air resulted in increased fish production. Increased volumes of air resulted in proportionate increases in dissolved oxygen content, allowing greater weights of foods to be offered to fish without depleting the oxygen content of the pond water. Chemical oxygen demand was inversely related to the volume of air delivered. (Katz)
W74-12251

COASTAL MARINE POLLUTION AND FISH,
Fisheries Research Board of Canada, West Vancouver, B.C. Pacific Environmental Inst.
M. Waldichuk.
Ocean Management, Vol 2, No 1, p 1-60, 1974. 7 tab, 110 ref.

Descriptors: *Marine fisheries, *Water pollution control, *Coasts, *Reviews, Fisheries, Water pollution sources, Water pollution effects, Industrial wastes, Domestic wastes, Sewage, Estuaries, Metals, Pesticides, Pollutants, Thermal pollution, Aquiculture, Water quality, Dissolved oxygen, Hydrogen ion concentration, Environmental effects, Ecosystems, Pulp wastes, Suspended solids, Food chains, Primary productivity, Toxicity, Shellfish, Biochemical oxygen demand, Oil, Radioactive wastes.
Identifiers: *Sub-lethal effects, Bioaccumulation, Artificial habitats.

Aquatic organisms are being threatened by a multitude of different types of pollutants, which impose a sub-lethal stress on the coastal marine ecosystem at all tropic levels. Reduction in diversity of species and population changes threaten the ecosystems. The economic effect of this pollution on world fisheries is considered and the importance of evaluating man's wastes and the possibilities of recycling these through the aquatic environment for man's benefit are discussed. Topics include: the use of domestic sewage for enriching the coastal waters for increased fish production; the use of cooling waters from thermal plants for enhancing growth of warm water species; using solid refuse to build artificial reefs for reef fish; and using artificial mudflats for intertidal shellfish culture. (Katz)
W74-12252

AMMONIA EXCRETION BY ZOOPLANKTON AND ITS SIGNIFICANCE TO PRIMARY PRODUCTIVITY DURING SUMMER,
Univ. of Washington, Seattle. Dept. of Oceanography.
M. Jawed.
Marine Biology, Vol 23, p 115-120, 1973. 2 fig, 2 tab, 23 ref.

Descriptors: *Ammonia, *Nitrification, *Primary productivity, *Cycling nutrients, Nitrogen compounds, Nitrogen, Zooplankton, Nitrogen cycle, Ammonification, Marine Plants, Marine animals, Nutrients, Withdrawl, *Columbia River, Methodology, Spectrophotometry, Jelly fish, Copepods, Nitrates, Stratification, Summer, Washington, Oregon.
Identifiers: *Excretion, Ammonia-N, Excretory rates.

Excretion rates of ammonia have been determined for zooplankton off the coasts of Washington and Oregon. Rates varied from 0.16 to 0.60 microgram-at NH4+ -N/ mg dry weight/day for most planktonic animals, and from 0.02 to 0.06 for jelly fishes. Ammonia concentration in sea water was low in offshore regions. Ammonia released by zooplankton was studied in relation to primary productivity during summer. In the Columbia River plume offshore, excreted ammonia contributed about 90% of the total nitrogen requirements of observed production rates. The ammonia-N contribution was 36% in oceanic waters, and was relatively unimportant in the inshore region. The significance of eddy diffusivity in offshore waters and upwelling in inshore waters is also discussed. (Katz)
W74-12253

OXYGEN CONSUMPTION IN RELATION WITH SIZE AND TEMPERATURE IN CRUSTACEA (CONSUMO DE OXIGENO EN FUNCION DEL TOMANO Y LA TEMPERATURA EN CRUSTACEOS),
Instituto de Investigaciones Pesqueras, Vigo (Spain).
M. Alcaraz.
Investigacion Pesquera, Vol 38, No 2, p 289-304, April 1974. 6 fig, 4 tab.

Descriptors: *Temperature, *Oxygen, *Size, Crustaceans, Shellfish, Respiration, Oxygen demand, Mathematical models, Mass.
Identifiers: *Prawns, *Decapoda, *Palaemonetes ssp., *Palaemon ssp., *Oxygen consumption, Arrhenius equation.

Oxygen consumption was studied in three species of Crustacea Decapoda (Palaemonetes varians, Palaemon Serratus and Palaemon Elegans); in the last one the relationship between O2 consumption, net weight and temperature was also calculated. Equations were devised which allowed for a mathematical comparison of the apparent effects of weight, body surface and length of oxygen consumption. The same calculations were made at 15, 18 and 20 degrees C to determine the effect of temperature on the values for oxygen consumption. The Arrhenius law was used for calculation and values are reported. (Katz)
W74-12254

VARIATION OF COPPER, IRON, MANGANESE AND ZINC CONTENTS OF OYSTERS (CRASSOSTREA ANGULATA) AT DIFFERENT STAGES OF GONADAL DEVELOPMENT (VARIACIONES DEL CONTENIDO EN COBRE, HIERRO, MANGANESO Y CINC EN RELACION CON LA MADURACION SEXUAL DEL OSTION, CRASSOSTREA ANGULATA, DE LAS COSTAS DE CADIZ),
Instituto de Investigaciones Pesqueras, Cadiz (Spain).
E. Pascual, and R. Establier.
Investigacion Pesquera, Vol 38, No 2, p 387-395, April 1974. 3 tab, 1 fig, 6 ref.

Descriptors: *Oyster, *Zinc, *Iron, *Manganese, *Copper, *Gonads, *Sexual maturity, Heavy metals, Absorption, Metals, Benthic fauna, Mollusks, Shellfish, Reproduction, Immature growth stage, Spawning, Bioassay.
Identifiers: *Crassostrea angulata, *Ovaries, Accumulation, Ovocytes, Gills, *Spain(Cadiz).

Copper, iron, manganese and zinc contents in Crassostrea angulata was studied in both male and female gonads at different stages of development. Copper and zinc were not concentrated in gonads. Manganese was stored in ovaries and increases in concentration as the volume increases in females. The reverse is true with males. Accumulation of manganese occurs inside the ovocytes during the growth stage. After spawning, the total concentration of manganese in oyster meat, mantle and gills is lower in females than in males. This suggests the possibility of manganese transference from different organs to ovaries. (Katz)
W74-12255

STUDIES ON COPPER, IRON, MANGANESE AND ZINC IN OYSTERS (CRASSOSTREA ANGULATA) ON THE GULF OF CADIZ (ESTUDIOS DEL COBRE, HIERRO, MANGANESO Y CINC EN OSTIONES-CRASSOSTREA ANGULATA-DEL GOLFO DE CADIZ),
Instituto de Investigaciones Pesqueras, Cadiz (Spain).
R. Establier, and E. Pascual.
Investigacion Pesquera, Vol 38, No 2, p 371-384, April 1974. 3 tab, 7 fig, 10 ref.

Descriptors: *Oysters, *Zinc, *Iron, *Copper, *Manganese, *Toxicity, Heavy metals, Bioassay, Absorption, Path of pollutants, Laboratory tests, Methodology, Analytical techniques, Seasonal, Mollusks, Shellfish.
Identifiers: *Crassostrea angulata, Kymograph, Accumulation, Shell movement, *Spain(Gulf of Cadiz).

Seasonal changes in copper, iron, manganese and zinc concentrations in oysters from two areas of SW Spain were studied. Relations between metal content and environmental conditions are unclear. A close correlation between copper and zinc is found. Variation in manganese content appears to be dependent on the sex and gonadal stage. Copper accumulation was shown by laboratory assays, but similar assays with manganese were negative. Shell movements were followed with a kymograph to determine the toxicity of different concentrations of metals. The first alterations of shell movements occurred at concentrations of 0.03 and 0.06 ppm copper. Zinc toxicity was 40-50 times lower than that of copper. (Katz)

EFFECTS OF THE POLYCHLORINATED BIPHENYL AROCHLOR 1254 ON THE AMERICAN OYSTER CRASSOSTREA VIRGINICA,
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Lab.
J. I. Lowe, P. R. Parrish, J. M. Patrick, Jr., and J. Forester.
Marine Biology, Vol 17, No 3, p 209-214, 1972. 4 fig, 1 tab, 10 ref.

Descriptors: *Polychlorinated biphenyls, *Growth rate, *Oysters, *Arochler, Laboratory tests, Absorption, Bioassay, Pesticides, Chlorinated hydrocarbon pesticides, Mortality, Pathology, Seawater, Animal physiology, Gas chromatography, Analytical techniques, Methodology, Retention, Microscopy, Cytological studies, Water pollution effects.
Identifiers: *Accumulation, *Crassostrea virginica, Depuration, Pathogenesis, Histopathology.

Young oysters were continuously exposed to Arochlor 1254, a PCB, in flowing, unfiltered seawater. Growth rate was significantly reduced in oysters exposed to 5 ppb for 24 weeks. Growth rate was not affected in oysters exposed to 1 ppb for 30 weeks. Mortality was not significant in exposed and control groups. In oysters exposed to 5 ppb, greatest PCB residue (whole body) was 425 mg/kg (ppm), 85,000 times the concentration in the water, and less than 0.3 ppm was retained after 28 weeks depuration in PCB-free water. In oysters exposed to 1 ppb, greatest residue was 101 ppm, 101,000 times the concentration in the water and less than 0.2 ppm was retained after 12 weeks depuration. Examination of oysters exposed to 5 ppb of this PCB for pathogenesis atrophy of digestive diverticular epithelium and degeneration of vesicular connective tissues concomitant with leukocytic infiltration, but tissue recovery seemed excellent after 12 weeks depuration. (Katz)
W74-12259

PRELIMINARY STUDY OF TEMPERATURE TOLERANCE IN JUVENILE HAWAIIAN MULLET (MUGIL CEPHALUS),
Oceanic Inst., Waimanaol, Hawaii.
J. R. Sylvester, C. E. Nash, and C. E. Emberson.
The Progressive Fish Culturist, Vol 36, No 2, p 99-100, April 1974. 1 tab, 10 ref.

Descriptors: *Lethal limit, *Temperature, *Mullets, Marine fish, Freshwater, Sea water, Laboratory tests, Juvenile fish, Resistance, Heat resistance, *Thermal pollution.
Identifiers: *Mugil cephalus, Temperature tolerance, Thermal shock, Zone of tolerance, Acclimation.

The upper and lower thermal limits necessary for the survival of juvenile Hawaiian mullet in freshwater and salt water were determined in laboratory tests. After acclimation at 21 degrees C in freshwater the upper lethal level was between 27 degrees and 29.6 degrees C, the lower level between 10.2 degrees and 15.0 degrees C. In saltwater following acclimation at 26 degrees C, the upper level is between 29.0 and 33.0 degrees C, and the lower level is between 10.4 and 14.0 degrees C. Results suggest that the zone of tolerance, as designated by upper and lower lethal levels, for juvenile mullet is greater in sea water. Other tests show that juvenile mullet are more resistant to the effects of low temperature than to high temperature. (Katz)
W74-12260

THE USE OF BIOASSAYS TO DETERMINE THE RATE OF DEACTIVATION OF PESTICIDES,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. L. Marking, and C. R. Walker.
Bioassay Techniques and Environmental Chemistry, p 357-366, 1973. 3 tab, 3 fig, 5 ref.

Descriptors: *Bioassay, *Pesticides, *Toxicants, Resistance, Anamycin A, Laboratory tests, Hydrogen ion, Concentration, Rainbow trout, Sunfishes, Bullheads, Channel catfish, Methodology, Mortality, Lethal limits, Model studies.
Identifiers: *Biological half-life, LC50, Goldfish, Biological activity, Ictalurus punctatus.

The biological half-life of a pesticide can be established by determining the tolerance of fish or other organisms in bioassay of aged solutions containing unknown residual concentrations, and in concurrent reference tests containing known concentrations. The half-life of biological activity is calculated in two procedures by plotting the percent concentration remaining in aged solutions or the deactivation indices against aging time on cyclic semi-logarithmic graph paper. The half-life of biological activity of antimycin, a powerful fish toxicant, was determined for rainbow trout, goldfish, channel catfish, black bullhead, green-sunfish and bluegill. Antimycin was deactivated rapidly in high pH waters and the half-lives were as follows: pH 10=1.5 hours, pH 9.5=4.6 hours, pH 9.0=9.7 hours, pH 8.5=46 hours, pH 8=100 hours, pH 7.5=120 hours, and pH's 6.0 and 6.5=310 hours. (Katz)

UPTAKE, METABOLISM AND DISCHARGE OF POLYCYCLIC AROMATIC HYDROCARBONS BY MARINE FISH,
Scripps Institution of Oceanography, La Jolla, Calif.
R. F. Lee, R. Sauerheber, and G. H. Dobbs.
Marine Biology, Vol 17, No 3, p 201-208, 1972. 9 tab, 28 ref.

Descriptors: *Organic compounds, *Metabolism, *Marine fish, *Aromatic compounds, Sculpins, Path of pollutant, Animal physiology, Biochemistry, Analytical techniques, Urine, Sea water, Absorption, Tracers, Chemical analysis, Lipids, DDT.
Identifiers: *Polycyclic aromatic hydrocarbons, *Naphthalene, 3-4-benzopyrene, Mudsucker, Sand dab, Gillichthys mirabilis, Oligocottus maculosus, Citharichthys stigmaeus, Gall bladder, Liver, Accumulation, Detoxification.

The uptake, metabolism and discharge of two polycyclic aromatic hydrocarbons, 14C-naphthelene and 3H-3,4-benzopyrene, were studied in 3 species of marine fish (mudsucker, Gillichthys mirabilis; sculpin, Oligocottus maculosus; sand dab, Citharichthys stigmaeus). The path of hydrocarbons through the fish included entrance through the gills, metabolism by the liver, transfer of hydrocarbons and their metabolites to the bile, and, finally, excretion. The gall bladder was a major storage site of labeled hydrocarbons and their metabolites. The major product of 3H-3,4-benzopyrene metabolism was tentatively identified as 7,8-dihydro-7,8-dihydroxybenzopyrene. The 14C-napthalene was metabolized to 1,2-dihydro-1,2-dihydroxynaphthalene after 24 h exposure. The urine appeared to be the major avenue for discharge of labeled hydrocarbon from the body. Certain polycyclic aromatic hydrocarbons were rapidly taken up from seawater by the above fish, but detoxification mechanisms existed for efficient removal of these compounds from their body tissue. (Katz)

THE FISH POPULATIONS OF AN INDUSTRIAL RIVER IN SOUTH WALES,
University of Wales Inst. of Science and Tech., Cardiff. Dept. of Applied Biology.
R. Williams, and M. F. Harcup.
Journal of Fish Biology, Vol 6, No 4, p 395-414, July 1974. 1 fig, 10 tab, 34 ref.

Descriptors: *Coal mine wastes, *Brown trout, Water pollution sources, Fish stocking, Industrial wastes, Urban runoff, Suspended solids, *Suspended load, Trout, Spawning, Algae, Methodology, Growth rates, Minnows, Fish populations, Biomass.
Identifiers: *Steelworks wastes, *Recolonization, Roach, Chub, *United Kingdom(Wales-River Sirhowy).

The River Sirhowy, a trout river in south-east Wales still subject to sporadically high levels of suspended solids derived from the coal mining industry, was investigated over a three year period to assess its importance in the recolonization of a fishless river, the Ebbw Fawr, which is expected to recover from the effects of steelworks effluents discharged near its headwaters. Eight species of fish were recorded. Spawning areas for brown trout were limited by industrial and urban developments and the discharge of suspended solids. Small numbers of native trout were produced in the system and the growth of these fish was poor in the main river, confirming the need for regular stocking. Movements of stocked trout were limited except in the lower reaches of the river where the presence of a native population, high

levels of suspended solids and flash floods may have increased the numbers of fish moving into the recovering Ebbw Fawr. (Katz)

CHANGES IN THE FISH SPECIES COMPOSITION OF THE GREAT LAKES,
Ontario Ministry of Natural Resources, Maple. Fish and Wildlife Research Branch.
W. J. Christie.
Journal of the Fisheries Research Board of Canada, Vol 31, No 5, p 827-854, May 1974. 10 fig, 4 tab, 90 ref.

Descriptors: *Great Lakes, *Lake trout, *Oligotrophy, Invasion, *Predation, Lake Erie, Lake Huron, Lake Superior, Lake Ontario, Lake Michigan, Succession, Competition, Ecosystems, Lampreys, Smelts, Herrings, *Eutrophication, Pest control, Environmental effects, Ecology, Dominant organisms.
Identifiers: *Sea lamprey, *Burbot, *Alewifes, Overfishing, Pest species.

The case histories of the changes that occurred in each of the Laurentian Great Lakes, as presented for the 1971 symposium on Salmonid Communities in Oligotrophic Lakes, are reviewed. Lakes Huron, Michigan, and Superior passed through a parallel series of stock changes after the invasion by sea lamprey. Lake trout and burbot stocks collapsed, followed by an increase in rainbow smelt, deepwater cisco and alewife stocks. Lake herring stocks collapsed in apparent response to the smelt increase. Eutrophication and more direct pollution stresses had mainly inshore impacts, but the similarity in the species sequencing in the Oligotrophic Great Lakes suggested that their influence before about 1950 was less than that of overfishing and the invasion of exotic species. Control of sea lamprey, overfishing, and eutrophication seemed attainable in the Great Lakes, but the only defense against further invasions by pest species appeared to be maintenance of sufficiently dense piscivore stocks to assure their suppression. (Katz)

NITRATE AND NITRITE TOXICITY TO SALMONID FISHES,
Rhode Island Univ., Kingston. Marine Experiment Station.
D. T. Westin.
The Progressive Fish Culturist, Vol 36, No 2, p 86-89, April 1974. 1 tab, 2 fig, 14 ref.

Descriptors: *Salmonids, *Toxicity, *Nitrates, *Nitrites, Water pollution effects, Ammonia, Water quality, Chinook salmon, Rainbow trout, Methodology, Toxicants, Hatcheries, Water quality control, Water reuse, Recirculated water, Fishkill, Mortality, Salinity, Freshwater, Sea water, Bioassay.
Identifiers: *Orcorhynchus tshawtscha, TLM, Metabolic wastes.

The median tolerance limit (TLM) concentration of nitrates and nitrites were determined for Chinook Salmon and Rainbow Trout. The effect of varying salinity on Rainbow Trout after exposure to nitrate and the effect of exposure time on mortality were examined. The relative activity of nitrite to Chinook fingerlings in freshwater was 2,000, 1,480, and 2,700 times that of nitrate in freshwater, at 96-hour, 7 and 10-day TLM, respectively. All of the trout subjected to nitrate concentrations showed acute signs after 2 days exposure, while these signs were not observed in the lower nitrate concentrations until after 5-8 days. Guidelines for hatchery water quality may be set from the data. Best results of growth and good health would indicate nitrate concentrations of 25-35 ppm and 0.12 ppm nitrite. Mode of action of nitrate as a toxicant must still be determined. (Katz)

SILVER TOXICITY AND ACCUMULATION IN LARGEMOUTH BASS AND BLUEGILL,
Oklahoma Univ. Health Sciences Center, Oklahoma City. Dept. of Environmental Health.
R. L. Coleman, and J. E. Cearley.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 1, p 55-61, July 1974. 2 fig, 1 tab, 10 ref.

Descriptors: *Bass, *Sunfishes, Metals, *Toxicity, Absorption, *Heavy metals, *Copper, *Zinc, Respiration, Metabolism, Growth rates, Enzymes, Bioassay, Food chains, Laboratory tests, Water pollution effects.
Identifiers: *Silver, Sublethal effects, Bioconcentration.

Silver has recently been recognized as a potentially toxic substance in aquatic substances. Analytical techniques to detect low levels of silver in the environment were unavailable in the past. Exposure of juvenile largemouth bass and bluegill to silver (0.3 to 70 microgram/liter) resulted in accumulation with highest concentrations in the internal organs of the bass. 70 microgram Ag/l was toxic to the bass within 24 hours but the bluegill tolerated this level for 6 months. Death was apparently due to respiratory disorder with some central nervous system involvement, as indicated by unusual behavior prior to death. The interactions of copper and zinc with silver were also investigated. (Katz)

IMPACT OF RECENT ECONOMIC GROWTH AND INDUSTRIAL DEVELOPMENT ON THE ECOLOGY OF NORTHWEST MIRAMICHI ATLANTIC SALMON (SALMO SALAR),
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
P. F. Elson.
Journal of the Fisheries Research Board of Canada, Vol 31, No 5, p 521-544, May 1974. 14 fig, 5 tab, 49 ref.

Descriptors: *Commercial fishing, *Atlantic salmon, *Fish management, *Water pollution effects, Environmental effects, Mine wastes, Domestic wastes, Pulp wastes, Commercial fish, Sport fish, Sport fishing, Salmon, Methodology, Ecology, Life cycles, Insecticides, Water pollution sources, Forests, Smolt, Estuaries, Distribution, Stocking, Reproduction, DDT, Zinc copper.
Identifiers: *Canada(Miramichi River).

The history of Atlantic salmon (Salmo salar) runs of the Northwest Miramichi from 1950 to 1973 is reviewed. Decreases in these runs are related to degrading ecological conditions in the river's reaches as a result of adverse chemical conditions attributable to recent developments in forest management and to base metal mining. Diversion of indigenous adult stocks into other streams of the system as a result of pollution of the home stream by mining, pulpmill and other human activities is examined and evaluated. Increases of commercial catches as a result of pollution-caused delay in the estuary of migrating adults is analyzed. Depletion of stocks as a result of the combined effects of these factors plus distant-water fishing is identified as is incipient recovery of stocks when home-water commercial fishing was eliminated and pollution abatement measures were introduced to the river. A suppressing effect of heavy angling pressure on stock abundance when stocks are low is noted. (Katz)

ANTICHOLINESTERASE ACTION IN METHYL PARATHION, PARATHION AND AZINPHOS-METHYL IN MICE AND FISH: ONSET AND RECOVERY OF INHIBITION,
Harvard Univ., Boston, Mass. School of Public Health.
G. M. Benke, and S. D. Murphy.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 1, p 117-122, July 1974. 2 fig, 1 tab, 16 ref.

Descriptors: *Sunfishes, *Insecticides, *Inhibition, Methodology, Toxicity, Enzymes, Biochemistry, Bioassay, Lethal limit, Laboratory tests, Organophosphorous pesticides, Water pollution effects.
Identifiers: *Azinphosmethyl, Mice, *LC50, *Acetylcholinesterase, *Parathion, Methyl parathion, Recovery.

The lethal ranges of parathion, methyl parathion and azinphosmethyl are 10-200, more than 2500, and 1-10 mg/kg respectively in sunfish. The large differences in these toxicities, relative to mice, (all values between 3 and 15 mg/kg) may be due to the onset and recovery of acetylcholinesterase (AChE) inhibition. This information would be useful in the suggested use of fish brain AChE as a monitor for pollution by organophosphate insecticides. The rates of onset of AChE inhibition did not explain the greater toxicity of parathion and azinphosmethyl relative to methyl parathion in sunfish. The rate of onset and recovery from AChE inhibition by all three pesticides in the fish brain and muscle is much slower than in mice and the slow recovery of AChE in fish may make them more susceptible to cumulative injury by these compounds. (Katz)

THE TOXICITY OF 2,3,7,8-TETRACHLORODIBENZO-P-DIOXIN (TCDD) IN GUPPIES (POECILIA RETICULATUS PETERS),
Pacific Northwest Forest and Range Experiment Station, Corvallis, Oreg.
L. A. Norris, and R. A. Miller.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 1, p 76-80, July, 1974. 1 fig, 2 tab, 18 ref.

Descriptors: *Toxicity, *2-4-5-T, *Herbicides, Chlorinated hydrocarbon, Pesticides, Organic pesticides, Laboratory tests, Pathology, Reforestation, *Water pollution effects, Environmental effects.

Identifiers: *TCDD, *Poecilia reticulatus, *Guppies.

TCDD is a contaminant of 2,4,5-trichlorophenoxyacetic acid (2,4,5-T), a herbicide used in reforestation. TCDD is highly toxic to mammals. Its toxicity to aquatic organisms is determined through experimentation with guppies, Poecilia reticulatus. Fish were exposed to 0.1, 1.0 and 10.0 ppb TCDD and all died from a 120 hour exposure, the smallest being first affected. All fish were dead 37 days after exposure. Behavioral and pathological signs of distress occurred in fish that survived more than 10 days. The concentrations of TCDD used in these tests were considerably greater than expected to occur in forest streams after aerial application of 2,4,5-T. The threshold response level for TCDD in fish has not been reported. (Katz)
W74-12274

LEAD CONCENTRATION IN NATIVE TROUT,
Montana State Univ., Bozeman. Dept. of Chemistry.
G. K. Pagenkopf, and D. R. Neuman.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 1, p 70-75, July 1974. 1 fig, 3 tab, 17 ref.

Descriptors: *Lead, *Rainbow trout, Analytic techniques, Spectrophotometry, Bioassay, Salmonids, *Path of pollutants, Heavy metals, Absorption, Trout, Brown trout, Cutthroat trout, Environmental effects, *Montana.
Identifiers: *West Gallatin River(Mont).

The concentration of lead in the atmosphere is greatly increased by proximity to highways. The West Gallatin River runs alongside a highway for 40 miles and the lead concentrations found in native trout taken from the river are compared to values for fish taken from fish hatcheries. Water samples were also taken and analyzed. Lead concentrations for gills, bone and tissue were determined, for fish of different ages as estimated by their size and for fish from three location types. Results indicate that there is very little enhancement of the lead concentration in the fish, probably because the traffic load of the highway is not large. (Katz)
W74-12275

THE SUSCEPTIBILITY OF SELECTED INSECTICIDES AND ACETYLCHOLINESTERASE ACTIVITY IN A LABORATORY COLONY OF MIDGE LARVAE, CHIRONOMUS TENTANS (DIPTERA:CHIRONIMIDAE),
Ohio State Univ., Columbus. Dept. of Entomology.
R. E. Karnak, and W. J. Collins.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 1, p 62-69, July 1974. 2 tab, 15 ref.

Descriptors: *Diptera, *Midges, *Insecticides, *Toxicity, Food chains, Aquatic insects, Pesticides, Enzymes, Bioassay, Larvae, Methodology, Dieldrin, Carbamate pesticides, Lethal limit, Spectrophotometry, Analysis techniques, DDT.
Identifiers: *Chironomus tentans, *Acetylcholinesterase activity, LC50, Allethrin, Malathion.

Laboratory tests were executed to determine the toxicity of a wide variety of technical grade insecticides to midge larvae. Modes of action and physiological aspects of the organism relating to toxicity, including metabolic detoxication, were determined. The larval stage of Chironomus tentans was very susceptible to representatives of the major groups of organic insecticides, with dieldrin being the most toxic. The susceptibility may be due to the low activity of protective enzymes which allow for detoxication. The organophosphates and carbamates were toxic by virtue of acetylcholinesterase inhibition. (Katz)
W74-12276

CHANGES IN URINE FLOW RATE AND HAEMATOCRIT VALUE OF RAINBOW TROUT SALMO GAIRDNERI (RICHARDSON) EXPOSED TO HYPOXIA,
Ministry of Agriculture, Fisheries and Food, London (England). Salmon and Freshwater Fisheries Lab.
D. J. Swift, and R. Lloyd.
Journal of Fish Biology, Vol 6, No 4, p 379-387, July 1974. 4 fig, 2 tab, 25 ref.

Descriptors: *Rainbow trout, *Oxygen, *Urine, *Animal physiology, Oxygen requirements, Biochemical oxygen demand, Membrane processes, Osmosis, Biochemistry, Metabolism, Methodology, Dissolved oxygen, Water pollution effects.
Identifiers: *Hypoxia, *Metabolic wastes, *Haematocrit, Urine flow rate, Haemoconcentration, Blood volume, Gills, Erythrocytes.

Measurements were made of urine flow rates and haematocrit of rainbow trout exposed to hypoxic conditions (3 mg O2/l) for 3, 4, 5 and 24 hr. Elevated urine flow rates during short time exposure and concomitant increased haematocrit, followed by lower than normal urine flow rates on return to normal aerated water suggest that the haemoconcentration is the initial response to anoxia. Results from longer exposure to hypoxic conditions suggest that the initial period of haemoconcentration is followed by a period of water retention and a return of the blood volume to normal; the sustained elevated haematocrit is thought to be derived from erythrocytes from storage organs. During prolonged exposure rainbow trout also become more permeable to water. (Katz)

ECOLOGICAL ASPECTS OF AQUATIC BIOLOGY THROUGH TIME-LAPSE PHOTOGRAPHY,
Maryland Univ., Solomons. Center for Environmental and Estuarine Studies.
M. J. Reber, and D. G. Cargo.
Maryland Water Resources Research Center, College Park, Completion Report No 25, (1974). 3 p. OWRT A-015-Md(1). 14-31-0001-3020.

Descriptors: *Sea nettles, *Jelly fish, *Photography, Embryonic growth stage, Biocontrol, Aquatic animals.
Identifiers: Cratena pilata, Chrysaora quinquecirrha, *Time-lapse photography, *Nudibranch, Sea slugs.

Records of the asexual budding phase of the sea nettle are now on film, however, techniques developed since that time now present the opportunity to improve upon those first images. In the area of biological control of the jellyfish, a successful attempt has been made to photographically describe the life cycle of a predator sea slug called a nudibranch. Included in this sequence was the ritualistic mating 'dance' and subsequent mutual exchange of gametes. The cleavage and early development of the fertilized egg was also captured on film. This footage has been shown to various malacological and zoological meetings, classes, groups, etc., all over the country. A unique view of molluscan egg development has been recorded.

PREDICTION OF ENVIRONMENTAL QUALITY IN DE-ENRICHED STREAM SYSTEMS,
Michigan Univ., Ann Arbor. School of Natural Resources.
F. F. Hooper, and G. R. Southworth.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 924, $3.75 in paper copy, $2.25 in microfiche. Completion Report, Institute of Water Research, Michigan State University, East Lansing, July 1974. 67 p, 22 fig, 22 ref. OWRR A-070-MICH(1). 14-31-0001-4022.

Descriptors: *Periphyton, *Nutrients, Phosphates, Fertilization, Herbivores, Natural streams, *Michigan, Primary productivity, Organic matter, *Eutrophication, Biological communities, Ecosystems, *Environmental effects.
Identifiers: *Trout stream ecosystem, *Pigeon River(Mich), Channelized stream systems, Surber sampler technique.

The effects of enrichment with 25 ppb inorganic phosphate on the composition and structure of the benthic invertebrate community of a trout stream ecosystem was investigated in a channelized stream system in the Pigeon River, Otsego County, Mich. This study was designed to assess the importance of periphytic production in determining and maintaining benthic community structure, and to gauge the impact of such low level enrichment on the resource value of the ecosystem. It was also designed to compare the changes wrought by plant nutrient enrichment with those associated with enrichment with organic material. The mean number of taxa per sample was higher in the fertilized channels than in the controls, and lower in the covered channel. Faunal diversity was relatively unaffected by fertilization, but was significantly reduced by organic enrichment and the elimination of periphyton. However, the equitability component of diversity was significantly lowered by fertilization and organic enrichment, and increased slightly with the elimination of periphyton. The results demonstrate that the herbivorous component of the invertebrate community is limited in overall abundance by the availability of food resources. Mild fertilization acts to increase this food resource and decrease the intensity of competition for food among herbivores. Nearly 55% of the common taxa in the experimental area were shown to be affected by variation in periphytic production.
W74-12347

EFFECTS OF RESIDUAL TOXINS IN OIL REFINERY EFFLUENTS ON AQUATIC ORGANISMS,
Oklahoma State Univ., Stillwater. Water Resources Research Inst.
T. C. Dorris, S. L. Burks, and G. R. Waller.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 919, $4.00 in paper copy, $2.25 in microfiche. Completion Report, June 30, 1974. 79 p, 17 fig, 20 tab, 3 ref, append. OWRT B-025-OKLA(1). 14-31-0001-3927.

Descriptors: Evaporation, *Toxicity, Discharge(Water), Biological treatment, Lagoons, *Sludge, Bioassay, Minnows, Crustaceans, Cations, Sodium, Calcium, Magnesium, Potassium, Copper, Cadmium, Chromium, Nickel, Lead, Iron, Zinc, Spectrophotometry, Chlorides, Ammonia, Ions, Electrodes, *Oil wastes, Water pollution effects, *Toxins, Chromatography, *Evaporators, *Pollutant identification, Daphnia.
Identifiers: Beckman Total Organic Carbon Analyzer.

Laboratory evaluations of partial evaporation of oil refinery waste waters were performed to determine (1) removal of toxic substances by partial evaporation (2) suitability for discharge to a receiving stream of the bottom partially concentrated waters from an evaporator (3) acceptability of overhead evaporator product water for reuse as boiler make-up or other uses. The waste waters from biological treatment--lagoon and activated sludge units--and from primary treatment facilities--API separator and air flotation--were partially evaporated in rotating thin-film or columnar falling film evaporators. Toxicity of original sample and overhead and bottom product fractions from evaporator was evaluated by static bioassays with fathead minnows (Pimephales promelas) and small crustaceans (Daphnia magna). Major cations: sodium, calcium, magnesium and potassium and trace heavy metals--copper, cadmium, chromium, nickel, lead, iron and zinc, were

analyzed with atomic absorption spectrophotometry. Chlorides and ammonia were analyzed with specific ion electrodes. Organic carbon concentration was analyzed with a Beckman Total Organic Carbon Analyzer. Highly toxic fractions from evaporators were solvent extracted to obtain samples of organic compounds for identification with gas chromatography mass spectrometry. Conclusions were that partial evaporation of biologically treated oil refinery waste water (1) removes toxic substances from biologically treated oil refinery waste waters (2) produces an overhead product water which has low inorganic salt concentration and should be reusable for boiler make-up or other uses where high-quality water is desirable (3) produces a partially concentrated bottom product water generally less toxic.

SOCIO-ECONOMIC IMPACT OF ESTUARINE THERMAL POLLUTION,
MetroStudy Corp., Washington, D.C.
J. S. Williams, Jr., and S. Spigel.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 034, $4.50 in paper copy, $2.25 in microfiche. Completion Report, 1974. 117 p, 4 fig, 37 tab, 2 append. OWRT C-4134(No. 9059)(1). 14-31-0001-9059.

Descriptors: *Thermal pollution, *Estuarine environment, *Social impact, *Economic impact, *New Jersey, Political aspects, *Recreation, Estuaries, Water pollution effects, Nuclear powerplants, *Attitudes, Benefits, *Cost-benefit analysis.
Identifiers: *Barnegat Bay(NJ).

The impact of thermal pollution from a nuclear power plant on people is indirect and is mediated by the perceived economic impact as well as the perceived environmental impact. Attitudes toward the power plant are primarily a function of the economic impact and secondarily a function of environmental attitudes. Residents who felt they derived economic advantage from a power plant tended to deny any adverse environmental impact. While strong feelings toward nature were associated with negative attitudes toward construction of another nuclear plant, participation in a particular sport or recreational activity provided no basis for prediction of a favorable or unfavorable attitude to the plant. For the immediate area around the Barnegat Bay estuary, the economic analysis showed a favorable ratio of benefits to costs. However, there was a poor distribution of impacts, so that some groups incurred greater costs than benefits. Technical assistance to local political bodies could lead to an early identification of economic disbenefits to local interests and lead to the establishment of a more equal distribution of benefits and costs.

IMPACT OF FOREST MANAGEMENT PRACTICES ON THE AQUATIC ENVIRONMENT,
Quinault Indian Reservation, Taholah, Wash. Quinault Resource Development Program.
B. J. Allee, and M. Smith.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 040, $3.00 in paper copy, $2.25 in microfiche. Completion Report, (1974). 21 p, 1 tab, 9 fig. OWRT C-4370(No. 9054)(1).

Descriptors: *Forest management, Watershed management, *Salmonids, *Washington, *Productivity, Fish management, Acid streams, Water quality, Toxicity, Hydrogen ion concentration, Forest soils, *Clear-cutting, Organic matter, *Indian reservations.
Identifiers: Cedar leachate, Total organic carbon, *Quinault Indian Reservation(Wash).

An integrated systems approach has been adopted to determine the effect of forest clear cutting practices on the variation in production of resident salmonids on the Quinault Indian Reservation, a part of the Washington Olympic Peninsula. Resident salmonid production was found to range from .01 g/m2 to over 8 g/m2. Streams low in productivity are characterized by high concentrations of organic materials greater than 50 ppm TOC, larger temperature variations and greater variation in stream discharge. Temporal reduction of salmonids occurred during early fall and coincided with drastic reduction in stream pH levels from greater than 5.5 to less than 4.0. Attempts to distinguish between variation in natural water quality and that caused by forest clear cutting will be made in Phase II of the project.

BASIC RESEARCH IN THE AQUATIC ENVIRONMENT: EFFECTS OF EUTROPHICATION ON PHYTOPLANKTON AND SELECTED SPECIES OF AQUATIC VASCULAR PLANTS-PHASE II,
Cornell Univ., Ithaca, N.Y. Dept. of Ecology and Systematics.
J. P. Barlow.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 108, $3.00 in paper copy, $2.25 in microfiche. Completion Report, Water Resources and Marine Sciences Center, Cornell University, Ithaca, New York, September 1974. 18 p, 4 fig, 18 ref. OWRT B-024-NY(4).

Descriptors: Aquatic environment, *Eutrophication, Effects, *Phytoplankton, *Water quality control, *Nutrients, *Research, Ponds, *Aquatic plants, Growth, Seasonal, Water resources, Management, *New York.
Identifiers: Continuous flow methods, Chemostats, *Cayuga Lake(NY).

An understanding of the effects of specific nutrients on existing plankton populations is necessary for the proper management of water resouces quality control. Recently, nutrient bioassay techniques have been widely used in experiments to identify limiting nutrients and predict the consequences of changes in them. These experiments suffer from numerous disadvantages, an important one being that they are performed under static conditions. It is recommended that continuous flow techniques provide more natural, suitable conditions for determining the effects of nutrients on algal populations. Frequently in such techniques, a chemostat containing the microorganisms is supplied with a nutrient medium at a constant slow rate, displacing a fixed proportion of the contained population via a constant level overflow. Recently, continuous culture has been used to study the selective effect of organic enrichment on natural populations of marine bacteria, and present studies are an extension of this approach. Described are the method used and results found in such experiments made during the winter of 1971-72 in an experimental pond, and shortly after in Lake Cayuga. (See also W74-06835) (Bell-Cornell)

INFLUENCE OF THE WATER POLLUTION,
World Health Organization, (Denmark). Regional Office for Europe.
A. Jernelov.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973. p 115-121, 1973. 1 tab.

Descriptors: *Water pollution effects, *Water pollution sources, *Pulp wastes, *Bleaching wastes, Toxicity, Fish, Aquatic organisms, Anaerobic conditions, Surfactants, Discharge(Water), Pollutants, Color, Lignins, Biodegradation, Biochemical oxygen demand, Organic loading, Chlorination, Polychlorinated biphenyls, Water reuse, Waste treatment, Waste water treatment, Bottom sediments, Fibers(Plant), Eutrophication, Thermal pollution, Mixing, Nutrients, Recreation.

Adverse effects of pulp and paper mill effluents on receiving streams are discussed. They include toxic (lethal and sublethal) effects on fish and other aquatic organisms, color caused by lignin, BOD loading, creation of anaerobic conditions, thermal pollution, formation of PCB (polychlorinated biphenyls) during pulp bleaching with chlorine, changes in nutrient balance, eutrophication, changes in the mixing behavior of water due to discharges of surfactants, persistence of difficulty biodegradable pollutants which aggravate water purification and reuse, fibrous bottom sediments or floating fiber banks that interfere with recreational and esthetic water uses. STUDY ON THE TOXICITY ON FISHES AND THE BIODEGRADABILITY OF THE PAPER-MILL WASTES, IN RELATION TO THE BIOCIDES USED,
Ente Nazionale per la Cellulosa e per la Carta, Rome (Italy).
M. Firpi, and V. Scarlata.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 449-489, 1973. 34 fig, 5 tab, 44 ref.

Descriptors: *Toxicity, *Pulp wastes, *Fish, *Pesticide toxicity, *Biodegradation, *Additives, *Water pollution effects, *Water pollution sources, Pesticides, Fungicides, Sulfur compounds, Mercury, Chlorinated hydrocarbon pesticides, Bromine, Organic pesticides, Trout, Rainbow trout.
Identifiers: Board mills, Slimicides, White water(Paper-machine), Mercury compounds, Bromine compounds, Tin compounds, Tin, Metal-organic(Organometal) compounds, Parchment paper(Vegetable parchment), Goldfish(Carassius auratus).

The toxicity of five slimicides and fungicides commonly used in pulp and paper mill water circuits was studied on goldfish (Carassius auratus) and rainbow trout (Salmo gairdneri), and compared with the toxic effects on effluents from linerboard, coated board, and vegetable parchment (parchment paper) mills. The biocides included pentachlorophenol sodium salt, organic tin compounds, phenylmercuric acetate, 2-bromo-4-hydroxy-acetophenone, and a mixture of 2-thiocyanomethylthiobenzothiazole plus 2-hydroxypropylemthane-thiosulfonate. The data obtained were correlated with the biodegradability of paper-machine white waters in the presence of microorganism nutrients. Among the most important findings were: Most biocides retard or inhibit the biodegradation of waste waters. Among the five pesticides tested, the Br compound was the most toxic and, along with the Hg compound and the sulfur compound mixture, must be considered as dangerous to the environment. These three compounds would interfere with the self-purification of streams and with natural BOD-removing microorganisms, such as activated sludge bacteria. Waters containing these additives tended to retain a low pH. Nonetheless, most paper mill effluents impose lower pollution loads on receiving streams than do the discharges of many other industries. URINARY LOW-MOLECULAR-WEIGHT PROTEINS IN ITAI-ITAI DISEASE,
Gunma Univ., Maebashi(Japan). Dept. of Hygiene.
K. Nomiyama, Y. Sugata, I. Murata, and Y. Nakagawa.
Environmental Research, Vol 6, No 4, p 373-381, December, 1973. 1 tab, 3 fig, 26 ref.

Descriptors: *Cadmium, *Toxicity, *Human pathology, *Urine, Diets, *Proteins, Water pollution effects.
Identifiers: *Itai-Itai disease, *Japan(Zinzu River).

The etiology of the so-called Itai-Itai disease has been thought to relate to malnutrition and dietary cadmium exposure. Itai-Itai disease, named after its severe pain, was endemic in Zinzu River area in Japan; its characteristic signs and symptons were osteomalacia and renal tubular dysfunction. Urinary low-molecular-weight proteins have been reported to be characteristic of renal tubular dysfunction. The components of urinary low-molecular-weight proteins in Itai-Itai disease are suggested to be retinol-binding protein and beta 2-microglobulin as determined by gel filtration, disc electrophoresis and immunoassay. Furthermore, vitamin D administration at a large dose is discussed and though to contribute to the aggravation of renal tubular dysfunction in Itai-Itai disease. (Jernigan-Vanderbilt)

In rat plasma, Cd109 was mainly associated with alpha-globulin fraction and Zn65 was bound to alpha- and beta-globulins. Subcutaneously injected cadmium chloride Cd109 and zinc chloride Zn65 resulted in rapid clearance of Cd109 from blood plasma, as compared to Zn65. Blood cells accumulated Zn65 more rapidly than Cd109. Greatest uptakes of Cd109 per unit weight of tissue were by liver, kidneys, and pancreas, but that of Zn65 was by the pancreas. From all tissues, Zn65 was depleted eventually. In the first six hours after isotope dose, testis tissue concentrated more Cd109 than Zn65. In tests, Zn65-influx continued for 168 hours, without further Cd109 increase. Both isotopes were excreted predominantly via the intestinal tract. Fecal and urinary excretion of Cd109 and Zn65 was accelerated by 2,3-dimercapto-1-propanol. Results indicate Cd109 follows metabolic pathways different from those of Zn65. (Jernigan-Vanderbilt)

PRESYNAPTIC AND POSTSYNAPTIC EFFECTS OF LEAD AT THE FROG NEUROMUSCULAR JUNCTION,
Cincinnati Univ., Ohio. Coll. of Medicine.
R. S. Manalis, and G. P. Cooper.
Nature, Vol 243, p 354-356, June 8, 1973. 4 fig, 28 ref.

Descriptors: *Lead, *Animal physiology, Laboratory tests, Testing procedures, *Frogs, Lethal limit.
Identifiers: Sublethal effects, *Synaptic effects.

Lead has long been known to be toxic to animals and humans, with some of its effects being attributable to actions on the neuromuscular system. It is shown that lead influences both pre- and postsynaptic events in neuromuscular transmission with the presynaptic ones being most sensitive. Experiments were performed in vitro on the isolated sciatic nerve-sortorius muscle preparation of the frog (Rana pipiens). Superficial neuromuscular junctions were located optically with a compound microscope (X400) standard microelectrode and photographic techniques were used to monitor intracellular responses from individual end-plates. It was concluded that lead reduced the end-plate potential by a presynaptic block and not by a postsynaptic one. To confirm this conclusion, other experiments were performed to see if lead decreased the ACh sensitivity of the postsynaptic (end-plate) membrane. The results showed that lead can only block postsynaptically in conditions in which the density of ACh-receptor complexes is much lower than it is during an end-plate potential. (Jernigan-Vanderbilt)

CHARACTERISTICS OF BACTERIOPLANKTON OF THE URAL RIVER IN THE ORENBURG REGION, (IN RUSSIAN),
Gosudarstvennyi Meditsinskii Institut, Orenburg (USSR). Dept. of Biology.
G. N. Solovykh.
Mikrobiologiya. Vol 42, No 2, p 336-339, 1973. English summary.
Identifiers: *Bacteria, Orenburg, *Plankton, *USSR(Ural River).

The bacterioplankton of the Ural river (USSR) and its seasonal dynamics were studied. The total bacterial number in waters of the Ural river near Orenburg was 300-3338 1,000 cells/ml. The maximum bacterial numbers were detected in the spring and in the autumn. The number of saprophytic bacteria in the river varied from 200-44,000 cells/ml with the minimum in winter and the maximum in summer autumn. The coli-index was 200-1400 cells/L and only sometimes reached 28,00 cells 1. The number of bacteria oxidizing hydrocarbons was 10-1,000,000 cells/mn. Desulfurating bacteria were rarely distributed in the Ural river, and their number was low. The qualitative composition of the bacterioplankton was varied. The waters contained spore-forming bacteria, various rods, cocci, azotobacter-like cells, and yeasts. The ratio between rods and cocci was 1:3.--Copyright 1973, Biological Abstracts, Inc.

METHYLMERCURY-INDUCED CHROMOSOME DAMAGE IN MAN,
University Hospital, Lund (Sweden). Dept. of Occupational Medicine.
S. Skerfving, K. Hansson, C. Mangs, J. Lindsten, and N. Ryman.
Environmental Research, Vol 7, No 1, p 83-98, February, 1974. 2 fig, 5 tab, 30 ref. SNEPB (7-29/68 and 7-15/71) SMRC 19X-3681.

Descriptors: *Mercury, *Organic compounds, *Chromosomes, *Cytological studies, Biology, Genetics, Fish, Public health, Human pathology, Laboratory tests, Testing procedures, Water pollution effects.
Identifiers: *Methylmercury.

Lymphocytes from blood cultures from 23 subjects exposed to methylmercury through intake of fish from contaminated waters and from 16 'nonexposed' subjects were studied cytogenetically. These were statistically significant relationships between frequencies of cells with chromatid-type aberrations, 'unstable' chromosome-type aberrations, and aneuploidy on the one hand and blood-cell mercury levels on the other. In the exposed subjects the blood-cell/plasma mercury ratio was high, which is chracteristic for exposure to short-chain alkylmercury compounds as opposed to the low ratio seen at exposure to inorganic mercury. Some of the exposed subjects approached, and in one case by far exceeded, the level of 400 ng/g blood cells, assumed to have been present in sensitive subjects suffering nervous system damage. However, none of the persons studied showed clinical evidence of methylmercury poisoning. The significance of these findings for the health of the subjects and their offspring is not known. In 11 of the exposed subjects, repeated samples were obtained during periods of 6 months to 3 years. No statistically significant relationship between variations in blood-cell mercury and chromosome aberrations could be established. (Jernigan-Vanderbilt)

COUGH RESPONSE AND UPTAKE OF MERCURY BY BROOK TROUT, SALVELINUS FONTINALIS, EXPOSED TO MERCURIC COM-

POUNDS AT DIFFERENT HYDROGEN-ION CONCENTRATIONS,
National Water Quality Lab., Duluth, Minn.
R. A. Drummond, G. F. Olson, and A. R. Batterman.
Transactions of the American Fisheries Society, Vol 103, No 2, p 244-249, April, 1974. 3 fig, 1 tab, 17 ref.

Descriptors: *Mercury, *Brook trout, *Organic compounds, *Lake Superior, *Toxicity, Laboratory tests, Laboratory animals, Fish, Testing procedures, Analytical techniques, Spectroscopy, Absorption, Hydrogen ion concentration.

The lowest concentration of methylmercuric chloride (MMC) and mercuric chloride added to Lake Superior water that caused a significant increase in cough frequency in brook trout was 3 micrograms Hg/liter. Cough frequency is a good short-term indicator of the long-term effects of MMC. The response can be used to predict the safe concentration of mercuric chloride since the long-term effects of this compound are not known. Increases in cough frequency were proportional to the concentration (from 3 to 12 micrograms Hg/liter) of both compounds at pH 7.5. The fish were more responsive to MMC when the pH of the test water was lowered to 6.0; response to mercuric chloride was not changed by lowered pH. Fish exposed to MMC at pH 6.0 contained more total mercury in their gills and red blood cells than fish tested at pH 9.0. The uptake of mercury by brook trout exposed to mercuric chloride did not differ significantly at pH 6.0 and 9.0. (Jernigan-Vanderbilt)

'NORMAL' LEAD AND CADIUM CONTENT OF THE HUMAN KIDNEY,
Veterans Administration Hospital, Birmingham, Ala. Trace Metals Lab.
J. M. Morgan.
Archives of Environmental Health, Vol 24, No 6, p 364-368, June, 1972. 4 tab, 36 ref.

Descriptors: *Lead, *Cadmium, *Human pathology, *Spectroscopy, Absorption, Distribution, Average, Pollutant identification.
Identifiers: *Kidney(Human), Background levels, Hypertension.

Cadmium and lead have been shown to cause hypertension, accelerated atherosclerosis, kidney disease, and neoplasia in experimental animals. Since both metals accumulate in the kidney, renal concentrations may reflect prolonged exposure. To evaluate effects of long-term moderate exposure, 'normal' concentration must first be established in man on the basis of autopsy studies. Increased renal lead was not associated with hypertension or neoplasia, although longevity was compromised as a result of clinical lead poisoning. Renal cadmium has been previously shown to be increased in man in association with neoplasia and emphysema. (Rowe-Vanderbilt)

PREVENTION OF LONG-TERM SEQUELAE FOLLOWING THE ABSORPTION OF LEAD,
Chloride Electrical Storage Co. Ltd., Manchester (England).
D. Malcolm.
Archives of Environmental Health, Vol 23, No 4, p 295-298, October, 1971. 2 tab, 28 ref.

Descriptors: *Pollution abatement, *Lead, *Absorption, *Human pathology, Environmental control, Distribution, Mortality, Industrial wastes, *Air pollution effects.
Identifiers: Hypertension, *Sequelae.

The initiation, in 1927, of modern measures of environmental control and medical supervision has reduced greatly the severity of exposure of employees of a storage batter factory to lead and has eliminated the occurrence of outright lead poisoning. An attempt was made to determine the extent to which the chronic effects of low-grade exposure to lead had been prevented by comparing the mortality and incidence of vascular hypertension and fatal cerebrovascular accidents among retired and currently employed persons of record with that of employees of a much later period, during which inplant exposure to lead has been reduced to levels now considered to be safe. CHROMIUM COMPLEXES WITH PROTEINS AND MUCOPOLYSACCHARIDES AND THEIR RELATIONSHIP TO CHROMIUM ALLERGY IN SENSITIZED GUINEA PIGS,
Pennsylvania Univ., Philadelphia. Dept. of Dermatology.
S. A. Katz, D. M. Scheiner, A. W. Klein, and M. H. Samitz.
Environmental Research, Vol 7, No 2, p 212-219, April, 1974. 4 fig, 1 tab, 10 ref. HEW (HO 00303) PHS (AM 0526).

Descriptors: *Chromium, *Proteins, *Laboratory animals, Animal physiology, Small animals(Mammals), Laboratory tests, Testing procedures.
Identifiers: *Chromium allergy, Guinea pigs.

The role of proteins and mucopolysaccharides as carriers for chromium in allergic eczematous dermatitis has been described by other investigators. This study is an attempt to extend these previous findings to a model for chromium allergy in chromium sensitized guinea pigs and to study the binding of chromium to proteins and mucopolysaccharides. Theoretical considerations and equilibrium dialysis were utilized to refute previous reports on the amounts of chromium that can be complexed to proteins and mucopolysaccharides. Purified chromium complexes containing no free chromium were then used to test chromium --- sensitized guinea pigs. The chromium-albumin complex is the only one of those studied found to reproducibly elicit a response. It was concluded that chromium-complexes are not directly involved in the allergic response mechanism, but at this time the apparent discrepancy associated with the chromium-mucopolysaccharide complexes cannot be explained. A METHOD TO MONITOR THE EFFECTS OF TOXICANTS UPON BREATHING RATE OF LARGEMOUTH BASS (MICROPTERUS SALMOIDES LACEPEDE),
National Inst. for Water Research, Pretoria, (South Africa); and Council for Scientific and Industrial Research, Pretoria (South Africa).
W. S. G. Morgan, and P. C. Kuhn.
Water Research, Vol 8, No 1, p 67-77, January, 1974. 10 fig, 3 tab, 18 ref.

Descriptors: *Monitoring, Pollutants, *Bass, Micropterus species, Laboratory animals, Fish, *Industrial wastes, Copper, Cadmium, Cyanide, Instrumentation, Testing procedures, Water pollution effects, *Respiration.
Identifiers: *Fish respiration disease.

Research into the effects of toxicants upon opercular rhythm has already established a distinct relationship between pollution and respiratory activity in fish. The purpose of this research was not only to confirm that the system may be used for a wide range of industrial pollutants, but also to attempt to delineate the limit of respiratory response to various acute and sub-lethal concentrations of toxicants. An apparatus was designed to measure continuously the effects of nominal concentrations of copper, cadmium, phenol, ammonia, and cyanide upon breathing rates in largemouth bass. Acute and sublethal toxic effects were indicated in a majority of cases by increased breathing rate. The use of this reaction and the monitoring apparatus to monitor a wide range of industrial pollutants was shown to be practicable. Consideration is also given to its possible application in local situations. (Jernigan-Vanderbilt)

EFFECTS OF SIMULTANEOUS VARIATIONS OF DIEL CHANGES OF TEMPERATURE, DISSOLVED OXYGEN, SALINITY, AND A POLLUTANT ON THE GROWTH OF WHITE CATFISH,
Connecticut Univ., Storrs. Inst. of Water Resources.
W. R. Whitworth.
Completion Report, 1974. 5 p, 1 tab. OWRT A-036-CONN(1). 14-31-0001-3207.

Descriptors: Water pollution effects, Fish physiology, *Growth rates, *Toxicity, *Aluminum, *Water temperature, *Dissolved oxygen, *Sodium chloride, Fishkill, *Catfishes, Salinity, Bioassay.
Identifiers: Fish toxicology, *Alum, White catfish.

Three long-term bioassays (8, 79 and 156 days) were performed in closed growth chambers with continuous waterflow to determine the growth and mortality responses of white catfish (Ictalurus catus L.) exposed to 2 diurnally fluctuating temperature and oxygen ranges and 3 diurnally fluctuating dissolved aluminum as alum (Al2 (SO4)3 . 14H20) and sodium chloride levels. One long-term bioassay(242 day) was performed in open tanks to determine growth responses of white catfish to 2 diurnally fluctuating temperature ranges and 2 diurnally fluctuating dissolved aluminum (as alum) and sodium chloride levels. Short-term bioassays (24, 48 and 96 hours) were performed on 8 species of freshwater and estuarine fishes and the stability of alum solutions was measured. Reduced growth rates and mean weights were exhibited by white catfish exposed to the highest fluctuating levels of temperature, oxygen, aluminum and sodium chloride. Eight species of fish had 96-hour TLM's (concentration at which 50% of the specimens would die) of 8.0 to 21.9 mg/liter Al. Aluminum solutions (15 and 50 mg/liter) were reduced at rates of .021 to .271 and .104 to .167 mg/liter/hr. (deLara-Connecticut)

STUDIES ON SOUTH AMERICAN FRESHWATER PLANKTON. NOTES ON THE PLANKTON FROM TIERRA DEL FUEGO AND VALDIVIA,
Uppsala Univ. (Sweden). Inst. of Plant Ecology.
K. Thomasson.
Annales Societatis Tartuensis ad res Naturae Investigandas Constitutate, Vol 1, p 52-64, 1957. 5 fig, 1 tab, 20 ref.

Descriptors: *South America, *Plankton, Freshwater, Temperate, Lakes, Chemical properties, Physical properties, Hydrogen ion concentration, Systematics.
Identifiers: *Tierra del Fuego(Argentina), *Valdivia(Chile).

Plankton species collected in 1940 from lakes in Tierra del Fuego and Valdivia are described. Water samples collected at the same time from Lago Fagnano, Lago Roca, Cabecera Lago, and Laguna de la Peninsula, Tierra del Fuego were analyzed in Uppsala for transparency, color, hydrogen ion concentration, conductivity, iron, manganese, chlorine, sulfate, total phosphorus, and total nitrogen. The pH was measured in situ. Some of the plankton species collected at Tierra del Fuego and Valdivia were new and are described with notes and drawings. (Auen-Wisconsin)

THE VEGETATION OF SWEDISH LAKES,
G. Lohammar.
Acta Phytogeographica Suecica, Vol 50, p 28-48, 20 fig, 41 ref.

Descriptors: *Aquatic plants, *Lakes, *Distribution, Geomorphology, Shores, Phosphorus, Nitrogen, Acidity, Turbidity, Systematics, Eutrophication, Oligotrophy, Temperature, Chemical properties, Light penetration, Water level fluctuations, Littoral.
Identifiers: *Sweden.

There are an estimated 96,000 lakes in Sweden, only a few of the larger in existence before glaciation. The temperature in July is about the same in all lowland Sweden; from the Gulf of Bothnia summer temperatures decrease to the west with increasing altitude. Dissolved substances vary within wide limits, the majority having low contents of dissolved minerals. Phosphorus and nitrogen are generally minimal, the highest values measured in lakes of the clayey plains where human habitation and agriculture increase the nutrient input. Most lakes have a neutral or weakly acid water with a summer pH between 6 and 8. Water transparency is probably below 3 m in most lakes. Aquatic plants occur all over Sweden--except in the alpine regions. The three most important helophytes are Phragmites, Scirpus lacustris and Equisetum fluviatile. In the oligotrophic lakes of southern Sweden, during summer low water, the exposed flowering mats of Litorella and in shallow water close to shore, large stands of flowering Lobelia appear, intermingled with Isoetes lacustris. Vascular aquatics are listed according to distribution. Changes in aquatic vegetation are recorded resulting from meiotrophy, climatic change, and human influence. (Jones-Wisconsin)
W74-12558

NOTES ON THE PLANKTON OF LAKE BANGWEULU,
K. Thomasson.
Nova Acta Regiae Societatis Scientiarum Upsaliensis, Ser IV, Vol 17, No 12, p 3-43, 14 fig, 2 tab, 97 ref.

Descriptors: *Algae, *Plankton, *Africa, Lakes, Swamps, Systematics, Tropical regions, Aquatic plants, Distribution, Vegetation.
Identifiers: Lake Bangweulu(Rhodesia), Desmids.

The eastern shore of Lake Bangweulu, Northern Rhodesia merges into the vast Bangweulu Swamp containing many open pools and small lakes from which plankton samples were collected. In spite of the random character of the samples there were a great variety of taxa present, many of them of great geographical and/or taxonomical interest. They are listed and extensive notes given. In the small Lake Wumba the following plants were frequent in the sample: Desmidium occidentale, Closterium kuetzingii, Micrasteria foliacea, and M. radiata. In the swamp Lake Chali, the dominant phytoplankter was Botryococcus braunii. In Lake Chaya, another swamp lake, the plankton community was dominated by Oscillatoria limosa, Melosira granulata, and M. nyassensis. M. agassizii is extremely rare. From Bwalya Mponda Lagoon a sample contained great quantities of detritus and sterile threads of Spirogyra. From an arm of Lake Bangweulu, the plankton composition was close to that of Lake Bangweulu, but instead of Zygnemales, it was dominated by Cyanophyta. One of the most interesting points is the discovery of many asymmetrical desmids, which seem to be sparse but widely distributed. (Jones-Wisconsin)

ECOLOGICAL EFFICIENCY OF A PELAGIC MYSID SHRIMP: ESTIMATES FROM GROWTH, ENERGY BUDGET, AND MORTALITY STUDIES,
National Marine Fisheries Service, La Jolla, Calif. Fishery-Oceanography Center.
R. I. Clutter, and G. H. Theilacker.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-73-10522. Fishery Bulletin, Vol 69, No 1, p 93-115, 1971. 15 fig, 8 tab, 60 ref. (Report No. NOAA-73030901-4). NSF-GB 7132.

Descriptors: *Energy budget, *Productivity, *Shrimp, Reproduction, Fecundity, Larvae, Biochemistry, Metabolism, Respiration.
Identifiers: Metamysidopsis elongata, Molting rates.

Energy units provide a means of expressing productivity in terms common to all organisms. Through laboratory studies of growth, molting, reproduction, respiration, body composition, and energy content, an energy budget was constructed for the pelagic mysid shrimp Metamysidopsis elongata. The energy budget data, together with estimates of natural population mortality rates, are used to estimate net and gross ecological efficiencies for the field population. Average growth and molting rates were determined by rearing the mysids in the laboratory. Size specific fecundity was determined from field and laboratory observations. The calorie contents of the mysids, their molts, eggs and larvae were estimated by bomb calorimetry and partially from biochemical composition. The energy used in metabolism was calculated from size specific respiration and data on body composition. The amount of energy lost in molts varies with age because the size of the molt increases and the molting frequency decreases. The net ecological efficiency (yield/assimilated) of a population of Metamysidopsis elongata (Crustacea, Mysidacea) is estimated to be 32%. The gross ecological efficiency (yield/ingested) is probably between 19% and 29%. (Jones-Wisconsin)

THE BIOLOGY OF BLUE-GREEN ALGAE.
University of California Press, Berkeley and Los Angeles. 1973. 676 p.

Descriptors: *Biology, *Cyanophyta, Metabolism, Synthesis, Plant physiology, Cytological studies, Photosynthesis, Structure, Chemical properties, Lipids, Proteins, Pigments, Genetics, Viruses, Nitrogen fixation, Movement, Plankton, Ecology, Marine algae, Hot springs, Carbon, Systematics, Evolution, Cultures, Carbonates, Algae.
Identifiers: Nucleic acids, Heterocysts, Collections, Anacystis nidulans, Thermophilic algae.

This compilation of studies on blue-green algae gives an account of most aspects of blue-green algal biology that are of general interest, or are currently the subject of particularly marked attention especially in relation to environmental deterioration. Few changes in taxonomy of blue-green algae have taken place in the past forty years, but knowledge of their morphology has been recast and expanded by electron microscopy. A wide variety of disciplines for study of the blue-green algae have been employed and are recorded in this volume. Significant was the separation of prokaryotic types. The implication of the 'bacterial-nature' of blue-green algae with the consequent anomaly of their possessing a higher-plant type photosynthetic system, has called for increased attention. Some of the 25 papers, for example, discuss the synthesis of metabolic intermediates, metabolic control and autotrophic physiology, structure and function of nucleic acids, mutagenesis and genetic recombination, nitrogen fixation, photomorphogenesis and nostocacean development, physiology and ecology of marine blue-green algae, ecology of blue-green algae in hot springs, and autotrophy and heterotrophy in unicellular blue-green algae. The four appendices give a list of culture collections and techniques for culture. (See W74-12563 thru W74-12591) (Jones-Wisconsin)

SYNTHESIS OF METABOLIC INTERMEDIATES,
Wales University Coll. of Wales, Aberystwyth. Dept. of Biochemistry.
A. J. Smith.
In: The Biology of Blue-Green Algae, p 1-38. University of California Press, Berkeley and Los Angeles, 1973. 5 fig, 5 tab.

Descriptors: *Synthesis, *Metabolism, *Cyanophyta, Photosynthesis, Carbon dioxide, Plant growth, Organic compounds, Light, Enzymes, Biochemistry, Plant physiology, Algae.
Identifiers: *Metabolic intermediates, Photoassimilation, Obligate phototrophs.

Much work on the intermediary metabolism of blue-green algae has been directed to the elucidation of the biochemical basis of their obligate growth characteristics. Many species, both filamentous and unicellular, have been shown to assimilate a wide range of organic compounds in the light and to incorporate them into a variety of metabolically related cell constituents. Studies show that blue-green algae like their obligately chemolithotrophic counterparts are not generally impermeable to organic compounds and are therefore not restricted to carbon dioxide as the carbon source. Those species which are apparently unable to grow on organic media in the dark (all unicellular and many filamentous species) are best classified as obligate phototrophs; this places the emphasis more on the energy source rather than the carbon source for although these organisms can utilize organic compounds in cell synthesis many appear unable to dispense with light for significant growth. Existence of specific metabolism lesions in cyanophytes raises possibility that the obligate character of many may be due to specific enzyme deficiencies preventing or severely limiting dark heterotrophic growth whilst permitting growth in light. It is not possible to identify with certainty the biochemical basis of their obligately phototrophic physiology. (See also W74-12562) (Jones-Wisconsin)
W74-12563

METABOLIC CONTROL AND AUTOTROPHIC PHYSIOLOGY,
Liverpool Univ. (England). Dept. of Biochemistry.
N. G. Carr.

In: The Biology of Blue-Green Algae, p 39-65, University of California Press, Berkeley and Los Angeles, 1973. 6 fig, 4 tab.

Descriptors: *Cyanophyta, *Metabolism, *Plant physiology, Carbon, Growth rates, Respiration, Enzymes, Amino acids, Synthesis, Biochemistry, Cytological studies, Algae.
Identifiers: *Autotrophic physiology, Electron transport, Biosynthesis, Cytochromes.

Studies with obligate phototrophs on the assimilation of organic material, oxidative and dark electron-transport activities, and control of enzymic activity are summarized. The relationship of these processes to the growth physiology of some blue-green algae is examined. Autotrophs are defined as organisms that require an energy source other than oxidation of reduced carbon. A striking feature of the photo-assimilation of carbon compounds by many blue-green algae, and certainly of Anabaena variabilis and Anacystis nidulans, is the inability of the exogenous carbon source to increase growth or respiratory rates. It has been established that blue-green algae have low, but consistent rates of oxygen consumption in the dark. Respiratory electron transport is discussed in connection with cytochromes, reduced pyridine nucleotide oxidase systems, and phosphorylation. Regarding control of enzymatic activity, tentative conclusions may be drawn that blue-green algae lack metabolic control by repression and de-repression of enzyme biosynthesis found in other microorganisms. In contrast, examples of enzymic control by allosteric alteration of enzymes, by end-products or substrate precursors, have been observed. No species has been described so far that cannot elaborate a proportion of its cell material from reduced carbon sources. (See also W74-12562) (Jones-Wisconsin)
W74-12564

ARRANGEMENT AND STRUCTURE OF THYLAKOIDS,
California Univ., Davis. Dept. of Botany; and Durham Univ. (England). Dept. of Botany.
N. J. Lang, and B. A. Whitton.
In: The Biology of Blue-Green Algae, p 66-79, University of California Press, Berkeley and Los Angeles, 1973. 17 fig.

Descriptors: *Cyanophyta, *Cytological studies, *Structure, Environmental effects, Light intensity, Plant physiology, Plant morphology, Algae.
Identifiers: *Thylakoids.

The most widespread arrangement of thylakoids (flattened membranous sacs) in cyanophyte vegetative cells is that where some membranes at least can be seen in any region of the cell but where, nevertheless, there is a marked tendency for concentration toward the cell periphery. Where the great majority thylakoids are peripheral, they are generally oriented parallel to the longitudinal cell wall. Direct connections between the plasmalemma and outer thylakoids have been reported in a range of species. While there is considerable variation in arrangement and structure of thylakoids in vegetative cells of blue-green algae, many features found either in cells of photosynthetic bacteria or in most chloroplasts have never been reported for blue-green algae. Effects of light intensity and temperature are reported. Although there have been only a few studies illustrating ultrastructure of akinetes, in general, the arrangement of thylakoids is similar to that in vegetative cells prior to their enlargement and differentiation. While it is becoming relatively easy to provide morphological explanations for some features of the arrangement of thylakoids within blue-green algal cells, there are few clues as to what extent different functions are associated with these different arrangements. (See also W74-12562) (Jones-Wisconsin)
W74-12565

PHOTOSYNTHETIC REACTIONS AND COMPONENTS OF THYLAKOIDS,
Purdue Univ., Lafayette, Ind. Dept. of Biochemistry.
D. W. Krogmann.
In: The Biology of Blue-Green Algae, p 80-98, University of California Press, Berkeley and Los Angeles, 1973. 3 fig. NSF GB 27466.

Descriptors: *Cytological studies, *Biochemistry, *Cyanophyta, Photosynthesis, Pigments, Chlorophyll, Oxidation-reduction potential, Algae.
Identifiers: *Thylakoids, Electron flow, Photosynthetic reactions.

Individual steps in electron flow during photosynthesis and overall sequence of reactions are considered. Use of NADPH as the reductant of phosphoglyceric acid may represent an evolutionary break by the blue-green algae from other photosynthetic prokaryotes. Evidence is appearing that structure of the pigment complexes in blue-green algae can be altered by energy-dependent conformational changes in the photosynthetic membranes. P-700 is the site of conversion of light energy into chemical work in Photosystem I. While there has been some controversy over which redox carrier reduces P-700, current evidence favors the copper protein, plastocyanin. The sequence of electron carriers between the c type cytochrome and Photosystem II is not clear. A sequence plastoquinone, cytochrome b, cytochrome c had been postulated for higher plant materials based on the redox potential but recent revisions in the estimated redox potential of cytochrome b indicate that it reduces plastoquinone which in turn reduces the 'c' type cytochrome. Photosystem II provides the electrons which are sent through the chain of carriers described. The cyclic phosphorylation activity of lamellae from Anabaena variabilis appears to be quite similar to that found in higher plant chloroplasts. (See also W74-12562) (Jones-Wisconsin)
W74-12566

FINE STRUCTURE AND CHEMICAL COMPOSITION OF THE CELL ENVELOPES,
Freiburg Univ. (West Germany). School of Microbiology.
G. Drews.
In: The Biology of Blue-Green Algae, p 99-116. University of California Press, Berkeley and Los Angeles, 1973. 7 fig.

Descriptors: *Cyanophyta, *Structure, *Chemical properties, *Cytological studies, Algae.
Identifiers: *Cell envelopes, Fine structure, Heterocysts, Akinete, Chemical structure.

Cells of prokaryotic organisms are usually enclosed by envelopes. The first envelope external to the cytoplasmic membrane (plasmalemma) is a multilayered structure, the cell wall. Many species have, external to the cell wall, a sheath or capsule which forms a thick and solid outer envelope frequently enclosing several cells, or a thin and dissolving slime layer. In young cross walls both electron-dense layers (L-2) appear to be a single layer. Subsequently the layers are interrupted by a less electron-dense layer, described as the middle lamella. Extracellular mucilage was observed to flow along the surface of trichomes of Oscillatoriaceae and other gliding species. Heterocysts are specialized cells, formed by differentiation of vegetative cells with strong and localized thickenings of the cell wall. The fine structure of the blue-green algal cell wall is similar to that of bacteria. Besides the murein components, carbohydrates, amino acids and fatty acids have been found in cell wall preparations. The mechanism of cell envelope synthesis is probably similar to that found in the bacterial cell. The mode of division, characteristic of filamentous blue-green algae, begins by an invagination of cytoplasmic membrane and peptidoglycan layer. (See also W74-12562) (Jones-Wisconsin)
W74-12567

CYTOCHEMICAL EXAMINATION OF BLUE-GREEN ALGAE,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
G. W. Fuhs.
In: The Biology of Blue-Green Algae, p 117-143. University of California Press, Berkeley and Los Angeles, 1973. 27 fig.

Descriptors: *Cytological studies, *Cyanophyta, *Analytical techniques, Biochemistry, Microscopy, Electron microscopy, Algae.
Identifiers: *Cytochemistry, Autoradiography.

Techniques that have been used successfully in cytochemical examinations of blue-green algae are discussed. An interference microscope translates in an unequivocal manner differences in optical lightpaths as large as several wavelengths into shades of brightness and color, and with compensators and micrometers permits quantitative measurement of refractive index and dry mass content. Gelatinous Cyanophycean sheaths of a polysaccharide nature are best stained with ruthenium red or basic dyes. Cytochemical techniques for the demonstration of nuclear material in Cyanophyceae are identical with techniques used for the demonstration of DNA. Light-microscopic techniques, electron-microscopic, and DNA-autoradiography are used. Ribonucleic acid and ribonucleoprotein account for the cytoplasmic basophilia in the blue-green algae, as demonstrated with light-microscopy. Cyanophyceae form a storage carbohydrate which is a polymer of glucose with a degree of branching between glycogen and amylopectin. Cytochemically this compound resembles glycogen. Polyphosphate granules (also known as metachromatin, metachromatic granules, or volutin) are concretions of linear polyphosphates of high molecular weight demonstrated by light-microscopy and electron-microscopy. The electron-microscopic identification of cyanophycin has been particularly problematic. The light-microscopic reactions of cyanophycin also show some resemblance to those given by bacterial plasmalemmosomes. (See also W74-12562) (Jones-Wisconsin)
W74-12568

LIPID COMPOSITION AND METABOLISM,
Unilever Ltd., Sharnbrook (England). Unilever Research Lab.
B. W. Nichols.
In: The Biology of Blue-Green Algae, p 144-161. University of California Press, Berkeley and Los Angeles, 1973. 5 fig, 5 tab.

Descriptors: *Chemical properties, *Lipids, *Metabolism, *Cyanophyta, Phylogeny, Plant morphology, Pigments, Cytological studies, Algae.
Identifiers: *Fatty acids, Hydrocarbons, Sterols, Poly-beta-hydroxybutyrate, Fatty alcohols, Chemical structure.

The intermediary position held by blue-green algae in the evolution of prokaryotic and eukaryotic organisms is reflected in their unique lipid and fatty acid compositions. Although all higher algae contain numerous classes of phosphoglycerides as well as glycosyldiglycerides, the blue-green algae usually contain only one quantitatively important phospholipid and three glycolipids. Certain blue-green algae usually contain only one quantitatively important phospholipid and three glycolipids. Certain blue-green algae are not unlike many bacteria not only in regard to general cellular morphology but also with respect to fatty acid synthesizing capacity. Existing data for the levels of the tocopherols in the blue-green algae indicate some relationship between the oxidizability of membrane fatty acids and the corresponding cellular tocopherol levels. With a single exception, blue-green algae resemble eukaryotic plants in accumulating plastoquinone A, vitamin K-1 and alpha-tocopherylquinone within the photosynthetic apparatus. Acyl lipids apart, pigments consitute the quantitatively major part of lipid extracts from

blue-green algae. Heterocysts contain substantial quantities of monohexoside derivatives of long-chain polyhydroxy alcohols. Sterols may prove far more widely distributed than was originally believed. The compositional data so far accumulated for the lipid constituents of individual blue-green algae underline the dangers of correlating molecular complexity with evolutionary status. (See also W74-12562) (Jones-Wisconsin)
W74-12569

BILIPROTEINS AND BILE PIGMENTS,
Chicago Univ., Illinois. Dept. of Biology.
D. J. Chapman.
In: The Biology of Blue-Green Algae, p 162-185. University of California Press, Berkeley and Los Angeles, 1973. 4 fig, 4 tab.

Descriptors: *Pigments, *Proteins, *Cyanophyta, Biochemistry, Amino acids, Synthesis, Rhodophyta, Cytological studies, Phylogeny, Algae.
Identifiers: *Biliproteins, *Bile pigments, Biosynthesis, Chemical structure.

Biliproteins are the red and blue bile pigment-protein conjugates of the blue-green, red and cryptomonad algae. They consist of non-cyclic tetrapyrrolic bile pigments covalently bound to a protein. The designation bilin or bile pigment is used as the generic name for the tetrapyrrolic chromophore. Thirteen biliproteins are currently known as distinct in vivo entities. Biliproteins usually represent 1-10% of the cell dry weight, although under certain circumstances it may be as much as 24%. Molecular weight, amino acid composition, and aggregation are discussed. It is established that the chromophores are bilins. The structure of in vitro chromophore, the in vivo chromophore and bilin-protein linkage, and billin-protein ratio are given. Evidence suggests there are two distinct chromophore-protein environments that are functionally very important. Phycobilisomes appear to have their own characteristic form. At the molecular level it has been generally accepted that bile pigments in plants and animals are derived by a common pathway and that such a pathway involves the formation and oxidative cleavage of a porphyrin. Results, indicating identity of a complex protein from a prokaryotic and eukaryotic source, are extremely interesting from the viewpoint of the symbiotic theory of chloroplast origin. W74-12570

STRUCTURE AND FUNCTION OF NUCLEIC ACIDS,
Imperial Chemical Industries Ltd., Runcorn (England). Corporate Lab., and Liverpool Univ. (England). Dept. of Biochemistry.
C. K. Leach, and M. Herdman.
In: The Biology of Blue-Green Algae, p 186-200. University of California Press, Berkeley and Los Angeles, 1973. 1 fig, 3 tab.

Descriptors: *Biochemistry, *Structure, *Organic acids, Cyanophyta, Chemical properties, Cytological studies, Synthesis, Mode of action, Algae.
Identifiers: *Nucleic acids, DNA, RNA, Chloroplasts.

The fine structure, chemical composition and biochemistry of the nucleic acids of blue-green algae are discussed and similarities between these and bacteria nucleic acids and of chloroplasts are compared. Ultrastructural investigations showed their distinction from nuclei of eukaryotes. The nuclear region of Anabaena cylindrica contained fibrils 5 to 7 nm diameter embedded in a matrix of lower electron density. The fibrils were assumed to be DNA by analogy with bacteria and comparison with stained nuclear areas. The base compositions of DNA from a group of organisms form one criterion by which the group can be classified. Blue-green algae possess mechanisms for maintenance and repair of DNA and appear to resemble other organisms in possessing two systems, one involving photoreactivation and the other dark repair. This maintenance of DNA, coupled with adequate control of DNA synthesis and accurate segregation of replicated DNA, ensures continuation of species as distinct groups free from major mutagenic changes. The process of ribosome formation and the regulation of their synthesis in the blue-green algae remain unstudied. Their distribution, size, and RNA composition are described. Transcription of DNA into RNA, translation, and nuclease activities are presented. (See also W74-12562) (Jones-Wisconsin)

MUTAGENESIS AND GENETIC RECOMBINATION,
Texas Univ., Port Aransas. Inst. of Marine Science.
C. Van Baalen.
In: The Biology of Blue-Green Algae, p 201-213. University of California Press, Berkeley and Los Angeles, 1973. 1 fig, 3 tab.

Descriptors: Algae, *Cytological studies, *Genetics, *Cyanophyta, Photoreactivation.
Identifiers: *Mutagenesis, *Recombination, Mutagenic agents.

The extent to which the nature of the chemical change in DNA leads to mutation, the possible selectivity of certain agents in causing only a limited spectrum of mutant isolates, and repair processes are operating in blue-green algae and influence the induction and recovery of mutants is only speculative. Much basic information on characterization of suspected mutant forms derived from a parent strain rests upon measurement of growth response changes. The spectrum of proven mutagenic agents is, in comparison with other organisms, limited. Alkylating agents have been used in attempts to produce mutant strains of blue-green algae. Ultraviolet radiation has also been observed to cause mutation. Types of mutants discussed are: antibiotic and drug resistant mutants, morphological mutants, nitrate assimilation mutants, pigment mutants, auxotrophs, mutants with altered ultraviolet light sensitivity, and others. Concerning repair processes, enzyme catalyzed photoreactivation, that is, restoration of biological activity by longer wavelengths than those causing the inactivation has been found. There are only a few observations that may be considered indicative of dark repair. Very little information is available concerning the arrangement of the genetic material. Results suggest that genetic exchange occurs in blue-green algae. (See also W74-12562) (Jones-Wisconsin)

PHYCOVIRUSES,
Environmental Protection Agency, Cincinnati, Ohio. Virology Section.
R. S. Safferman.
In: The Biology of Blue-Green Algae, p 214-237. University of California Press, Berkeley and Los Angeles, 1973. 7 fig, 2 tab.

Descriptors: *Viruses, *Cyanophyta, Systematics, Biocontrol, Algae.
Identifiers: *Phycoviruses, Algal viruses.

Attention has been focused on degree of control that phycoviruses may exercise over behavioral patterns of algae. Many morphological and chemical similarities are evident between viruses infecting bacteria and blue-green algae. A system of nomenclature stressing host specificity as its basic criterion was adopted for the algal viruses. Those algal viruses specifically infecting the Cyanophyta are classified under the common name blue-green algal virus (BGAV). Isolation of the LPP-1 virus led to the first serious attempt to use disease-causing agents in controlling algal populations. Apart from their algicidal application, it has been suggested that BGA viruses be used for assessing the efficiency of enteric virus removal in waste treatment processes. LPP-1 viruses are discussed under properties of the virus and its hosts, occurrence and distribution, effects of physical and chemical agents on the virus, characteristics of the viral nucleic acid and protein, replication cycle of the virus, interaction of radiations with the virus-host system, and the viral DNA replication. LPP-2 viruses, SM-1 virus, N-1 and AS-1 viruses, miscellaneous BGA viruses, and temperate BGA viruses are considered. (See also W74-12562) (Jones-Wisconsin)

THE HETEROCYST,
Westfield Coll., London (England). Dept. of Botany.
P. Fay.
In: The Biology of Blue-Green Algae, p 238-259. University of California Press, Berkeley and Los Angeles, 1973. 7 fig, 2 tab.

Descriptors: *Cytological studies, *Cyanophyta, Plant morphology, Structure, Nitrogen fixation, Plant physiology, Biochemistry, Algae.
Identifiers: *Heterocysts.

Characteristic features of heterocysts are rounded shape and relatively large size, partial separation from the neighboring vegetative cells by constriction, presence of conspicuous, thick surrounding envelope except at polar region, seemingly homogeneous cell content due to absence of cytoplasmic granular inclusions, presence near the attachment to the vegetative cell of strongly refractive structures called 'polar nodules', or 'polar thickenings', and a rather yellowish-green appearance. Heterocysts are produced during active growth of the blue-green alga. There is an indication of involvement of heterocysts in nitrogen fixation yet it neither necessitates nor excludes the assumption that nitrogenase is present in the vegetative cells. Some relationship between heterocysts and spores is characteristic of many blue-green algae. In Anabaena species heterocysts are frequently flanked by spores, and sporulation normally progresses from here from one vegetative cell to another. A theory that heterocysts function as storage organs was rejected as no storage products could be demonstrated. The latest hypothesis that heterocysts are involved in nitrogen fixation and may be the actual sites of effective nitrogenase activity provides a major metabolic role for these structures and is in accord with much of the knowledge of heterocyst occurrence and physiology. (See also W74-12562) (Jones-Wisconsin)

NITROGEN FIXATION,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
W. D. P. Stewart.
In: The Biology of Blue-Green Algae, p 260-278. University of California Press, Berkeley and Los Angeles, 1973.

Descriptors: *Nitrogen fixation, *Cyanophyta, Plant physiology, Measurement, Cytological studies, Enzymes, Photosynthesis, Algae.
Identifiers: Nitrogenase activity, ATP.

There are more genera of blue-green algae known to fix nitrogen than there are of heterotrophic and photosynthetic bacteria combined. Heterocystous species are the most common forms of nitrogen-fixing algae. There is also evidence of nitrogen fixation by pure cultures of unicellular blue-green algae and by non-heterocystous filamentous algae. The requirements for in vitro nitrogenase activity are similar to those of nitrogenases from other plant groups in that a reductant and a source of ATP are essential. There are two main approaches to the elucidation of endogenous reductant sources in blue-green algae, one using cell-free ex-

tracts, and the other using whole cells. The specific function of ATP in the process is uncertain. Use of the acetylene reduction technique provides means whereby reductant and ATP requirements can be studied in short-term experiments without complications of a requirement for carbon skeletons to accept the fixed nitrogen. Blue-green algae are alone among nitrogen-fixing organisms in that they evolve oxygen during photosynthesis. It is proposed on the basis of these findings that in heterocystous algae, in air, perhaps an active nitrogenase occurs only in the heterocysts but that under anaerobic conditions both heterocysts and vegetative cells have an active enzyme. (See also W74-12562) (Jones-Wisconsin)
W74-12575

PHOTOMORPHOGENESIS AND NOSTOCACEAN DEVELOPMENT,
State Univ. of New York, Binghamton. Dept. of Biological Sciences.
N. Lazaroff.
In: The Biology of Blue-Green Algae, p 279-319. University of California Press, Berkeley and Los Angeles, 1973. 15 fig, 3 tab.

Descriptors: *Cyanophyta, *Cytological studies, *Nostoc, *Reproduction, Light, Evolution, Pigments, Life cycles, Plant morphology, Algae.
Identifiers: *Photomorphogenesis, Development stages, Polymorphism, Pleomorphism, Hormogonia, Heterocysts.

The work which established present basis for classification of heterocystous organisms mentioned nostocacean polymorphism and referred to possible influence of the natural environment on the succession of forms observed. Pleomorphic phenomena were frequently noted as responses to imposed alternations of physical and chemical environments of developing pure cultures. Dark growth and photoinduction and photoreversal of development are described. Some hypothetical models for photocontrol of development and pigment synthesis in cyanophycean cells are presented under spectral dependence, pigment synthesis, and developmental control. The release of hormogonia is affected by endogenous factors produced by growing thalli as well as by incident light quality. As a consequence of prolonged filamentous growth, cultures containing glucose display a woolly amorphous macrostructure, termed the 'lanose' macromorphology. The factors which influence direction of hormogonial migration, or the formation of motile aggregates of Nostocaceae trichomes are not understood. Light requirements and effects of inhibitors on migration of hormogonia are discussed. The factors controlling development of the Nostocaceae operate on a basic cycle of morphological change. Prolongation of a particular stage can result in variations of morphology within that stage following an alteration in some intrinsic interaction. (See also W74-12562) (Jones-Wisconsin)
W74-12576

MOVEMENTS,
Oregon Univ., Eugene. Dept. of Biology.
R. W. Castenholz.
In: The Biology of Blue-Green Algae, p 320-339. University of California Press, Berkeley and Los Angeles, 1973. 5 fig.

Descriptors: *Movement, *Cyanophyta, Light intensity, Light quality, Velocity, Environmental effects, Algae.
Identifiers: Gliding behavior, Motility mechanism, Oriented movements, Phototaxis.

Motility in blue-green algae is by gliding. Relatively slow gliding progress is accompanied in some species by rotation of the trichome along its axis. Any point on the trichome will trace either a right-handed or left-handed helix, species specific and noninterchangeable. Gliding velocity is dependent on numerous environmental factors including light intensity, light quality, temperature, pH, and medium viscosity. Availability of phosphate bond energy is the most immediate determinant. Utilization rate of ATP in gliding, as in other enzymatic processes, is temperature dependent. Full motility is immediately light dependent in some species of cyanophytes but coupled almost completely to respiratory energy production in others (Oscillatoria princeps). The current proposal for Oscillatoria is that numerous microfibrils strung uninterrupted in helices around exterior portion of trichome are the propulsive organelles which move the cell chain against an elastic sheath or other suitable substrate by rapid succession of unidirectional waves. Phototaxis is the only tactic response that has received much attention. Phototopotaxis is orientation and movement toward or away from incident light. Photo-phobotaxis is reversal of movement direction following a sudden change from high to low light intensity or vice versa. (See also W74-12562) (Jones-Wisconsin)
W74-12577

GAS VACUOLES,
Westfield Coll., London (England). Dept. of Botany.
A. E. Walsby.
In: The Biology of Blue-Green Algae, p 340-352. University of California Press, Berkeley and Los Angeles, 1973. 3 fig.

Descriptors: *Cytological studies, Cyanophyta, Structure, Mode of action, Algae.
Identifiers: *Gas vacuoles, Fine structure, Buoyancy.

Electron microscopy showed that gas vacuoles of blue-green algae are made up of stacks of membranous, hollow subunits. These gas vesicles retain their characteristic cylindrical appearance when they are isolated from algal cells is not subjected to pressure to cause their collapse. Metal shadowing and negative staining of isolated gas vesicles both reveal that the outer surfaces of the cylindrical structures have a striated topography. Chemical analyses have confirmed the proposition suggested by electron microscopy, that the gas vesicle membrane is fundamentally different from typical unit membranes. Chemical analysis of high purity preparations has demonstrated that protein is the major, and probably the only component. It has been postulated that gas vesicles might have arisen from over-production of protein by ancestral viral infections. The pressure of gas inside the vacuoles is usually at about one atmosphere, much lower than would exist in bubbles of a comparable size. By estimating the percentage area occupied by gas vesicles in thin sections of Anabaena flos-aquae cells, it was established that the gas vacuole content increased as cultures aged. Of the three functions that gas vacuoles might fulfil, that of storing gas is no longer tenable. The two other functions provide light shielding and buoyancy. (See also W74-12562) (Jones-Wisconsin)
W74-12578

FRESHWATER PLANKTON,
Durham Univ. (England). Dept. of Botany.
B. A. Whitton.
In: The Biology of Blue-Green Algae, p 353-367. University of California Press, Berkeley and Los Angeles, 1973. 1 tab.

Descriptors: *Cyanophyta, *Freshwater, *Plankton, Eutrophication, Plant morphology, Plant physiology, Ecology, Nitrogen, Phosphorus, Anabaena, Reproduction, Algicides, Inhibition, Tropical regions, Temperate, Competition, Algae.
Identifiers: Aphanizomenon, Oscillatoria, Quinone.

Ecological literature on planktonic blue-green algae is concerned largely with only about twenty species, those which sometimes form populations dense enough to be termed 'waterblooms'. Of the features widespread among bloom-forming species, the most obvious shown by nearly all such blue-green algae is the possession of gas vacuoles. Sensitivity to toxic substances, for example 2,3-DNQ, is found among bloom-forming species. There is also evidence that blue-green algae capable of forming blooms are more sensitive to copper than many other blue-green species. In the presence of dense blue-green algae blooms, algae belonging to other phyla are usually present only in low densities; at the same time the blue-green algal components of the bloom usually consist of only a few species, often with one overwhelmingly dominant. One obvious factor which will lead to selection for particular species is the availability of combined nitrogen. There have also been observations which indicate differences in the ability of bloom-forming species to use different phosphorus sources and levels. Depth of the water, occurrence of planktonic forms, spore formation, effect of temperature are all considered. Studies on planktonic species in individual genera include Aphanizomenon, Anabaena and Oscillatoria. (See also W74-12562) (Jones-Wisconsin)
W74-12579

PHYSIOLOGY AND ECOLOGY OF MARINE BLUE-GREEN ALGAE,
University Coll. of North Wales, Bayer. Marine Science Lab.
G. E. Fogg.
In: The Biology of Blue-Green Algae, p 368-378. University of California Press, Berkeley and Los Angeles, 1973.

Descriptors: *Marine algae, *Distribution, *Cyanophyta, Plant physiology, Ecology, Littoral, Sands, Rocks, Shores, Salt marshes, Mangrove swamps, Plankton, Algae.

Marine representatives of Cyanophyceae have some distinct features, including their nitrogen-fixing activities. The littoral fringe is delineated below by upper barnacle limit and its upper part is characterized by lichens, Verrucaria and Lichina. Free-living blue-green algae, belonging predominantly to genera Calothrix, Phormidium, Gloeocapsa, Nodularia and Rivularia, occur as a black encrusting film on rocky shores. Sand which remains undisturbed sufficiently long develops a blue-green community. In salt marshes and mangrove swamps, many species are the same as found on rocky shores, e.g., Calothrix scopulorum, Rivularia atra, Lyngbya aestuarii, Hydrocoleum lyngbyaceum and Phormidium tenue. Calothrix confervicola and Symploca hydnoides are recorded between low water mark and 5 m below this level and Lyngbya majuscula down to 30 m below low tide level in the Ria de Arosa. The tendency of Cyanophyceae to become symbiotic is manifested in the sublittoral. The exacting requirements of sublittoral forms contrast with the tolerance to variations in salinity noted for intertidal blue-green algae and suggests the existence of ecologically selected strains. The blue-green algae appearing in the marine plankton belong mainly to the genera Oscillatoria, Trichodesmium, Pelagothrix, Haliarachne and Katagnymene. Nostoc and a Dactylococcopsis have been reported from deep water. (See also W74-12562) (Jones-Wisconsin)
W74-12580

ECOLOGY OF BLUE-GREEN ALGAE IN HOT SPRINGS,
Oregon Univ., Eugene. Dept. of Biology.
R. W. Castenholz.
In: The Biology of Blue-Green Algae, p 379-414, University of California Press, Berkeley and Los Angeles, 1973. 9 fig.

Descriptors: *Ecology, *Cyanophyta, *Hot springs, Oregon, Chemical properties, Temperature, Hydrogen ion concentration, Nitrogen fixation.
Identifiers: *Thermophilic blue-green algae, Yellowstone National Park, Synechococcus lividus,

Oscillatoris terebriformis, Mastigocladus, Thermal ecology, Algae.

The subject of thermal ecology as applied to cyanophytes raises the question of whether a thermal tendency in blue-green algae may be expected because of some basic feature of their prokaryote cells. Cyanophytes occur in almost every illuminated hot spring above a pH of 5 and below 74C in western North America or below 64C in much of the rest of the world, unless there are extreme concentrations of certain solutes. In the Oregon hot springs, the unusually high temperature minimum for Synechococcus mat development is probably determined by the other competitive cyanophyte at that temperature, Oscillatoria terebriformis. In the Yellowstone springs, most work on cyanophyte mats was concentrated on a few alkaline sodium, chlorine bicarbonate springs. Many Yellowstone hot springs mats have the ability to fix nitrogen. One of the unique features of thermal biosystems is that few, if any, identical assemblages of microorganisms can be found on a global scale even when the physicochemical environment appears similar. The distribution of Synechococcus lividus, of Oscillatoria terebriformis, and of Mastigocladus are given. Sulphide appears the most common of chemical variables in hot springs that influence species composition. (See also W74-12562) (Jones-Wisconsin)
W74-12581

INTERACTIONS WITH OTHER ORGANISMS,
Durham Univ. (England). Dept. of Botany.
B. A. Whitton.
In: The Biology of Blue-Green Algae, p 415-433, University of California Press, Berkeley and Los Angeles, 1973. 2 fig.

Descriptors: *Cyanophyta, *Bacteria, *Symbiosis, Protozoa, Fungi, Algae, Carbon dioxide, Viruses, Habitats, Myxobacteria, Algicides, Inhibition, Epiphytology, Infection, Parasitism, Hosts, Lichens, Mosses, Nitrogen fixation.
Identifiers: Prokaryotes, Eukaryotes, Photosynthetic organisms, Multicellular animals, Antagonistic effects, Lytic bacteria, Phycobionts.

Blue-green algae occurring in a wide range of habitats influence, or are influenced by the behavior of a wide range of other organisms. Only two aspects have been studied closely: the lytic effect of certain organisms, especially myxobacteria, and the possible importance of bacteria in raising the carbon dioxide level. That organisms from many different taxa have at times a marked influence on behavior of blue-green algal populations is clear, for instance, bacteria, protozoa, fungi and viruses have all been shown to destruct local planktonic populations. It is still impossible to evaluate the relative importance of the various antagonistic agents in nature. The problems are to what extent different agents are more important in different habitats, and to what extent are their antagonistic effects influenced by the physiological conditions of the algal population. The answers are of obvious significance in situations where it is desired either to increase or decrease algal growth. Of many examples known of marked interactions between blue-green algae and eukaryotic organisms--protozoa fungi, photosynthetic organisms and multicellular animals--are the wide range of symbiotic associations. W74-12582

THE RELATIONSHIP BETWEEN BLUE-GREEN ALGAE AND CARBONATE DEPOSITS,
Boston Univ., Mass. Dept. of Biology.
S. Golubic.
In: The Biology of Blue-Green Algae, p 434-472, University of California Press, Berkeley and Los Angeles, 1973. 19 fig.

Descriptors: *Cyanophyta, *Carbonates, *Sedimentology, *Aggradation, Calcium carbonate, Marine geology, Freshwater, Geologic history, Carbonate rocks, Sedimentary rocks, Travertine, Algae.
Identifiers: Concretions, Oncolites, Algal stromatolites, Algal mats.

The relationship between cyanophytes and carbonates has attracted scientific attention for a long time, both in the geological and biological sciences. Fossil sedimentary structures found in carbonate rocks have been attributed to the activity of cyanophytes. The critical factor in the equilibrium is the amount of dissolved gaseous carbon dioxide in the system which depends upon the partial pressure of carbon dioxide in the atmosphere above the solution. Once precipitated from solution, calcium carbonate can either crystallize directly and form a sediment in the immediate environment, or it can be transported to form sediment elsewhere. Hence the calcium carbonate found in the thalli of benthic cyanophytes does not necessarily come exclusively from their own biogenic precipitation. Carbonate encrustation and its use in cyanophyte taxonomy depends upon degree of variability of encrustation within a species under different environmental conditions, and degree of convergency between different species under encrusting conditions. Marine carbonate precipitation and sediment formation in the marine coastal environment are discussed. Fossil stromatolitic structures occur throughout the entire geological column from the early Precambrian to the Recent. The disintegration of carbonate substrates by algae and fungi are reported. W74-12583

STATUS OF CLASSICAL TAXONOMY,
Madras Univ. (India). Botany Lab.
T. V. Desikachary.
In: The Biology of Blue-Green Algae, p 473-481, University of California Press, Berkeley and Los Angeles, 1973.

Descriptors: *Cyanophyta, *Systematics, Evolution, Algae.
Identifiers: Chroococcales, Filamentous blue-green algae.

Phycological problems of blue-green algal classification are generated by the classical taxonomy of their 150 genera and about 1500 species. Two broad categories are easily distinguishable, the coccoid (Chroococcales) and the filamentous forms. The latter are characterized by short pieces of trichomes which serve as reproductive bodies, the hormogonia. Refinement of the classification of the filamentous forms has resulted in separation of two (or more) orders, Nostocales and Stigonematales. Two other groups, sometimes treated as separate orders, the Chamaesiphonales and the Dermocarpales, include forms which exhibit polarity. The Stigonematales, can be distinguished from the other hormogonalean members (Nostocales) by the occurrence of true branches and the heterotrichous habit. In the sequential arrangement of the orders and families two systems are known, one followed by those who believe in the progressive evolution of the blue-greens from Oscillatoria-like plants to Stigonema-like ones and the other by those who believe that the reverse has taken place in a retrogressive evolution. Almost all agree that the coccoid forms are primitive, and they are generally placed at the very beginning of the whole group. (See also W74-12562) (Jones-Wisconsin)
W74-12584

PROSPECTS FOR TAXONOMIC DEVELOPMENTS,
Ceskoslovenska Akademie Ved, Trebon. Inst. of Microbiology.
J. Komarek.
In: The Biology of Blue-Green Algae, p 482-486, University of California Press, Berkeley and Los Angeles, 1973.

Descriptors: *Systematics, *Cyanophyta, Mathematical studies, Plant morphology, Plant physiology, Algae.
Identifiers: Numerical taxonomy.

Potentialities for using numerical methods in helping to clarify the muddled situation in blue-green alga taxonomy is presented. Classical taxonomy, with its underlying evolutionary assumptions, uses the monothetic principle of classification, as all the characters of subordinate taxa must necessarily be included in the definition of a superior taxon. The procedures of numerical classification involve the polythetic formation of taxonomic groups, without any preliminary definition of the distinguishing features characterizing the superior taxon. The taxa are defined by means of sets of input characters. Results of this procedure do not necessarily substantially differ from those obtained by the traditional methods. Use of numerical taxonomy does not exclude the necessity for observing the Code of Botanical Nomenclature. Any modern taxonomic revision requires data of at least two different types (e.g. morphological and physiological) combined with several different methodological approaches. Numerical evaluation requires as comprehensive a set of characters as possible, in contrast to the traditional system, which usually cannot make efficient use of all the accumulated morphological data. Although numerical methods in revising blue-green algae classification are stressed, numerous systems should be tried on smaller taxonomic units. (See also W74-12562) (Jones-Wisconsin)
W74-12585

EVOLUTIONARY AND ECOLOGICAL ASPECTS OF THE CYANOPHYTES,
Wisconsin Univ., Madison. Dept. of Bacteriology.
T. D. Brock.
In: The Biology of Blue-Green Algae, p 487-500, University of California Press, Berkeley and Los Angeles, 1973. 9 fig.

Descriptors: *Evolution, *Ecology, *Cyanophyta, Stratigraphy, History, Pigments, Anaerobic conditions, Thermal springs, Nitrogen fixation, Hydrogen ion concentration, Algae.
Identifiers: *Identification.

The cyanophytes are members of the prokaryotic group which contain chlorophyll-a and a phycobilin and which evolve oxygen by photosynthesis. The distinction from eukaryotic algae is usually made on the basis of general lack of intracellular differentiation in cyanophytes. If the cyanophyte has a cell diameter greater than 2.0 micrometers it can usually be distinguished from other prokaryotes; the difficulty arises when their cell diameters are less than 1.0 micrometer. Certainly the cyanophytes were the first oxygen-producing photosynthetic organisms, and they were probably responsible for a marked increase in the atmospheric oxygen concentration during the Precambrian period. Some cyanophytes are able to grow anaerobically, a property not normally associated with eukaryotic algae. Cyanophytes are the exclusive oxygen-evolving photosynthetic organisms in thermal springs, and are the only group of oxygen-evolving photosynthetic organisms which fix nitrogen. Their gas vacuoles permit upward movement in the water column from lower depths. The ability to live anaerobically may be a property retained by this group since their initial evolution in the Precambrian, providing them with a selective advantage over eukaryotic algae in certain habitats. (See also W74-12562) (Jones-Wisconsin)
W74-12586

AUTOTROPHY AND HETEROTROPHY IN UNICELLULAR BLUE-GREEN ALGAE,
Institut Pasteur, Paris (France).
R. Y. Stanier.
In: The Biology of Blue-Green Algae, p 501-518, University of California Press, Berkeley and Los Angeles, 1973. 6 fig, 8 tab.

Descriptors: *Cyanophyta, *Metabolism, *Nutrient requirements, Enzymes, Biochemistry, Carbon, Algae.
Identifiers: *Autotrophy, *Heterotrophy, Photoheterotrophy, Chemoheterotrophy, Aphanocapsa 6714, Synechococcus 6301, Aphanocapsa 6308, Unicellular blue-green algae.

All blue-green algae examined use light as an energy source and carbon dioxide as a carbon source, their dominant nutritional mode being photoautotrophy. Like other autotrophs, blue-green algae can take up organic compounds. Probably all blue-green algae can perform a light-dependent assimilation of organic substrates, such as acetate and amino acids. Many blue-green algae appear to be obligate photographs; the range of organic compounds able to support growth of facultative chemoheterotrophs is remarkably narrow--confined to glucose, fructose and one or two disaccharides. Data strongly suggests that growth of facultatively heterotrophic strains in dark is much slower than growth in light implying that rate of ATP synthesis by non-photochemical means is always far less than the rate of ATP synthesis by photophosphorylation. The range of organic compounds that support dark growth is so narrow because the pentose phosphate pathway is the sole energy-yielding dissimilatory pathway. If some blue-green algae can grow with sugars in the dark, why cannot all members of the group do so. The barrier seems to lie in one (or both) of the steps required to convert exogenous glucose to glucose-6-phosphate, mediated by glucose permease and hexokinase. (See also W74-12562) (Jones-Wisconsin)
W74-12587

CULTURE COLLECTIONS. APPENDIX A,
Ceskoslovenska Akademie Ved, Trebon. Inst. of Microbiology.
J. Komarek.
In: The Biology of Blue-Green Algae, p 519-524, University of California Press, Berkeley and Los Angeles, 1973.

Descriptors: *Algae, *Cultures, *Laboratories, Foreign countries, Canada, United States, Cyanophyta.
Identifiers: *Culture collections.

Laboratories which maintain culture collections of algae in Canada, Czechoslovakia, the Federal Republic Germany, France, German Democratic Republic, Great Britain, India, Japan, Switzerland, United States, and the Soviet Union are listed. Details are given under each specific laboratory. Investigators are advised to carefully examine all cultures for contaminants, including non-listed species of blue-green algae. (See also W74-12562) (Auen-Wisconsin)
W74-12588

NOTES ON ISOLATION AND LABORATORY CULTURE. APPENDIX B,
Liverpool Univ. (England). Dept. of Biochemistry.
N. G. Carr, J. Komarek, and B. A. Whitton.
In: The Biology of Blue-Green Algae, p 525-530, University of California Press, Berkeley and Los Angeles, 1973. 4 tab.

Descriptors: *Algae, *Cultures, *Cyanophyta, Laboratory tests, Methodology.

A selection of experimental procedures known to be effective for the isolation and laboratory culture of blue-green algae is presented. Several techniques, some involving the specific resistance to agents toxic to many bacteria or fungi, are listed. The use of non-mutagenic antibiotics is increasing and cycloheximide (actidione) is of particular value in inhibiting many eukaryotic contaminants. Detailed descriptions of the effects of particular antibiotics are summarized. Many species may be conveniently maintained in liquid culture or on agar slopes of mineral salts, the latter often preferable. Blue-green algae, unlike many other prokaryotes, should not be maintained in a refrigerator. Exponential growth may be achieved for several algal species and the culture media employed for some are described. Blue-green algae are sometimes very fastidious and the use, for all media, of double-glass distilled water is recommended. (See also W74-12562) (Auen-Wisconsin)
W74-12589

CONTINUOUS CULTURE OF FILAMENTOUS BLUE-GREEN ALGAE. APPENDIX C,
Bhabha Atomic Research Centre, Bombay (India). Biology and Agriculture Div.
J. Thomas.
In: The Biology of Blue-Green Algae, p 531-535, University of California Press, Berkeley and Los Angeles, 1973. 4 fig.

Descriptors: *Algae, *Cyanophyta, *Cultures, Methodology, Laboratory tests, Analytical techniques.
Identifiers: *Continuous culture, Chemostat.

Details of the working and control of the chemostat which has been found to give satisfactory steady-state performance for filamentous photosynthetic microorganisms such as Anabaena are reported. Briefly, continuous culture entails growing the microorganism in submerged culture with continuous addition of the medium at a specified rate while simultaneously harvesting the microbial suspension at a similar rate thus keeping the culture volume constant. By changing the dilution rate, different rates of growth are obtained. Maintaining a given dilution rate will soon result in a steady-state culture with physiological characteristics typical of the prevailing growth rate. The limiting factor is usually light intensity in photosynthetic microorganisms because the mean effective light intensity on the cell or on unit biomass is directly related to the dilution rate. The chemostat offers the advantages that the suspension depth (and thus the volume of suspension) can be changed in steps of 5 cm and chemostatic overflow ensured at any of the depths. Temperature is controlled without the use of cumbersome water baths. The provision for unilateral light facilitates direct assessment of light energy utilization by comparing incident light at the base of the cylinder and transmitted light measured just above the suspension. (See also W74-12562) (Auen-Wisconsin)
W74-12590

MASS CULTIVATION OF ANACYSTIS NIDULANS. APPENDIX D,
Tuebingen Univ. (West Germany). Institut fur Chemische Pflanzenphysiologie.
F. Juttner.
In: The Biology of Blue-Green Algae, p 536-539, University of California Press, Berkeley and Los Angeles, 1973. 1 fig.

Descriptors: *Algae, *Cultures, *Cyanophyta, Cytological studies, Laboratory tests, Methodology.
Identifiers: *Mass culture, Anacystis nidulans.

A laboratory technique to produce a sufficient number of cells of Anacystis nidulans and the construction of a large-scale culture unit that can easily produce kilogram amounts of algae is described in detail. It is based on the principle for algae cultivation of an open air pilot plant. Only inert materials like borosilicate glass and PTFE were used to prevent a negative influence of solved material on the algal growth. Besides Anacystis a great number of other algae from different classes as well as photosynthetic bacteria could be successfully grown in this culture unit. (See also W74-12562) (Auen-Wisconsin)
W74-12591

EFFECTS OF TOXAPHENE CONTAMINATION ON ESTUARINE ECOLOGY,
Georgia Univ., Sapelo Island. Marine Inst.
R. J. Reimold, P. C. Adams, and C. J. Durant.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-74-10408; $4.50 in paper copy, $2.25 in microfiche. Georgia Marine Science Center, Skidaway Island, Technical Report Series No 73-8, September 1973. 100 p, 19 fig, 34 tab, 9 ref.

Descriptors: *Water pollution effects, *Estuaries, *Ecology, Sampling, Salt marshes, Georgia, Aquatic plants, Sediments, Statistical methods, Aquatic animals, Chlorinated hydrocarbon pesticides, Systematics.
Identifiers: *Toxaphene, Diversity index, Duplin Estuary(Ga), Sapelo Island(Ga).

The stream effluent from a toxaphene manufacturing plant drained directly into a tidal stream adjacent to Sapelo Island, Georgia, had released significant toxaphene in its effluent for the past two decades so that a shellfish pesticide monitoring program detected high levels of toxaphene in shellfish ten miles downstream. Samples of fauna, flora, sediment, and water were analyzed for toxaphene content. The major study area was a salt marsh watershed on the southeastern coast of Georgia. Purpose of the research was to quantify potential effects of toxaphene effluent on the estuarine fauna and flora and monitor quantitative changes in the ecosystem that might be associated with a toxaphene pollution abatement program. Ecological comparisons based on species diversity indices were made between this contaminated system and a pristine area. Computations of species diversity indices were completed using an IBM 360-65 computer. As the toxaphene content in the plant effluent decreased during the three year study period, the toxaphene content of fauna, flora and sediments also decreased. Concurrent with this was a significant increase in species diversity of the Brunswick marsh area, especially Terry Creek. (Jones-Wisconsin)

ROLE OF ALGAL AND FUNGAL POLYSACCHARIDES IN THE FORMATION AND HYDROLYSIS OF LAKE SEDIMENTS,
Ohio State Univ., Columbus. Dept. of Microbiology.
V. Sangar, and P. R. Dugan.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-236 177, $3.25 in paper copy, $2.25 in microfiche. Ohio Water Resources Center Project Completion Report No 394X, September 1973. 37 p, 2 fig, 12 tab, 59 ref. OWRT A-024-OHIO(1).

Descriptors: *Organic compounds, *Hydrolysis, *Carbohydrates, *Lake sediments, Cyanophyta, Algae, Fungi, Eutrophication, Lake Erie, Nitrogen, Lipids.
Identifiers: *Polysaccharides, Anacystis nidulans, Alternaria tenuis, Smittium culisetae.

Evidence indicates that extracellular bacterial polymers contribute significantly to sedimentation, representing an oxygen demand. The role of non-bacterial microorganisms such as algae and fungi in producing extracellular polymer is discussed. Because of the potential significance during algal blooms in Lake Erie, studies were conducted to determine extent and composition of polysaccharides produced by Anacystis nidulans and to determine what nutritional factors might influence cell and polymer production. Cell walls of Smittium culisetae were isolated by mechanical means and a quantitative and qualitative study was made. Lipid composition of an Alternaria was also studied. The relative distribution of major lipid classes of Alternaria tenuis isolated from bottom muds of Lake Erie's western basin are also presented. Both Anacystis nidulans and Alternaria tenuis were cultured on various nitrogen sources to determine effects of nitrogen on growth. It is

likely that Anacystis, responsible for algal blooms produces soluble polysaccharides which diffuse into the water causing a greater organic enrichment than would be accounted for by many procedures used to measure primary productivity. Examination of Alternaria tenuis lipids showed that almost all the major classes of lipids were present in its mycelium. (Jones-Wisconsin)

BACTERIAL CONTROL OF AQUATIC ALGAE,
Ohio State Univ., Columbus. Dept. of Microbiology.
J. C. Burnham.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-236 185, $4.00 in paper copy, $2.25 in microfiche. Ohio Water Resources Center Project Completion Report No 414X, October 1973. 90 p, 16 fig, 1 tab, 6 plates, 92 ref.

Descriptors: *Algal control, *Bacteria, *Biocontrol, *Cyanophyta, Parasitism, Mode of action, Laboratory tests, Toxicity, Chemcontrol, Algae.
Identifiers: *Bdellovibrio bacteriovorus, Phormidium luridium, Cell lysis, Selenium.

Active bdellovibrio cultures as well as culture supernatants (cell free by centrifugation and filtration) were capable of breaking down Oscillatoria. The disintegration caused by the enzymatic secretions of the bdellovibrios is extensive, resulting in the loss of cytoplasmic cell contents and eventual cell wall dissolution. Four day old cultures of blue-green algae, Oscillatoria sp. or Phormidium luridum, were interacted with 24 hr. cultures of Bdellovibrio bacteriovorus ATCC no. 15143 in both solid and liquid environments. Phase contrast microscopic examination showed gradual structural changes in both algae species until after 4 days only cell wall fragments remained. When photosynthesis was followed in the mixed culture of Bdellovibrio bacteriovorus and the bacterial-free Phormidium, a total inhibition of oxygen evolution occurred after 36 hours. The inhibition of photosynthesis will be the key to isolation and purification of the lytic factor. Experiments with lytic factor dilutions indicate that 1 bdellovibrio cell is producing enough of the factor to inhibit 75 P. luridium blue-green algae cells. Appendix II describes an improved method of cell enumeration for filamentous algae and bacteria and Appendix III discusses the toxic effects of selenium to blue-green algae. All laboratory tests and results are detailed. (Jones-Wisconsin)

THE BEHAVIOR OF PHOSPHATE IN THE INTERSTITIAL WATERS OF CHESAPEAKE BAY SEDIMENTS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Earth and Planetary Sciences.
J. T. Bray.
Available from the National Technical Information Service, Springfield, Va. 22161 as COO-3292-7, $10.50 in paper copy, $2.25 in microfiche. PhD thesis, 1973. 161 p, 28 fig, 13 tab, 114 ref. AEC AT(30-1)3497, AT(11-1)3292, NSF RANN GI-38973.

Descriptors: *Cycling nutrients, *Phosphates, *Connate water, *Chesapeake Bay, Sediments, Maryland, Iron, Mathematical models, Sediment-water interfaces, Analytical techniques, Distribution, Estuaries, Sampling.
Identifiers: Ferrous iron, Vivianite, Apatite.

Determinations of interstitial phosphate concentrations and a number of associated chemical paramenters were made on sediment cores taken along the axis of Chesapeake Bay. The phosphate analysis used is a measure of Soluble Reactive Phosphate, a method sensitive not only to inorganic orthophosphate, but also to some soluble organic phosphate forms and, so some extent, short-chain polyphosphates. These data were included into a simple equilibrium model. Results indicate that interstitial phosphate concentrations are covarient with the concentrations of dissolved ferrous iron and can be described by equilibrium between pore water and the mineral vivianite. This situation is contrary to the commonly accepted view that phosphate concentrations are controlled through equilibrium with the calcium phosphate minerals, especially the apatite group. Vivianite as a distinct sedimentary mineral phase was demonstrated by x-ray diffraction. The presence of vivianite lends additional support to the results of the equilibrium model. The interstitial waters of Chesapeake Bay sediments are a vast reservoir of dissolved inorganic phosphate. Estimates of diffusional flux into the overlying water indicate that the relative supply of phosphate to the biomass by this means may be of little significance. (Jones-Wisconsin)
W74-12658

A COMPARTMENTED AQUATIC MODEL OF THE RELATIONSHIP BETWEEN CARBONATE AND NITRATE IN A GREAT PLAINS RESERVOIR,
Oklahoma State Univ., Stillwater. Dept. of Chemistry; and Oklahoma State Univ., Stillwater. Dept. of Zoology; and Los Alamos Scientific Lab., N. M.
L. P. Varga, G. K. Rice, D. W. Toetz, and E. D. Loughran.
Available from the National Technical Information Service, Springfield, Va. 22161 as CONF-730445-1, $3.25 in paper copy, $2.25 in microfiche. Mimeo (undated). 22 p, 9 fig, 2 tab, 12 ref. AEC AT(11-1)-2070 AT(40-1)-4254.

Descriptors: *Mathematical models, *Nitrates, *Carbonates, *Eutrophication, *Algae, Reservoirs, Great Plains, Oklahoma, Cyanophyta, Cycling nutrients, Potable water, Actinomycetes, Solar radiation, Temperature, Light intensity, Ammonia, Oxygen, Carbon dioxide, Forecasting, Equations.
Identifiers: Lake Carl Blackwell(Okla).

Evidence is provided for the usefulness of a mathematical model in predicting annual bloom of blue-green algae in Lake Carl Blackwell, a water supply reservoir in Oklahoma. Some advances in the development of automated environmental sensors and a computational model for nitrate uptake are described. Size of the algal bloom may determine the population of actinomycetes which are generally blamed for musty odors in drinking water. A compartmented simulation model was developed in the form of a set of non-linear simultaneous differential equations. Input data used are diel and annual changes in irradiance, nitrate, ammonia, oxygen and carbon dioxide and annual changes in temperature. The maximum uptake rate of nitrate by phytoplankton as a function of light intensity was determined on August 14, 1970 by the N-15 isotopic dilution technique. The total inorganic carbon concentration was corrected for the carbonate tied up as complex ions assuming equilibrium at the surface. Predictions of the time course of the algal blooms made by the model are gratifyingly close to the observed wax and wane of algal populations, considering the limited data base. (Jones-Wisconsin)

CHESAPEAKE BAY NUTRIENT INPUT STUDY,
Environmental Protection Agency, Annapolis, Md. Annapolis Field Office.
V. Guide, and O. Villa, Jr.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-228 389, $10.00 in paper copy, $2.25 in microfiche. Technical Report 47, September 1972. 141 p, 30 fig, 28 tab, 28 ref.

Descriptors: *Eutrophication, *Chesapeake Bay, *Nutrients, Tributaries, Water quality, Watersheds(Basins), Potomac River, Rivers, Seasonal, Maryland, Surveys, Regression analysis.
Identifiers: *Nutrient loading, *Nutrient sources, Susquehanna River, Patuxent River, Rappahannock River, Mattaponi River, Pamunkey River, Chickahominy River, James River.

An intensive water quality survey of the Chesapeake Bay's major tributary watersheds was conducted to determine the primary sources and relative contribution of nutrients affecting the Chesapeake Bay from nontidal areas. The survey was confined to the following watersheds: Susquehanna, Patuxent, Potomac, Rappahannock, Mattaponi, Pamunkey, Chickahominy, and James. The primary sources of nutrients entering the Chesapeake Bay emanate from three major watersheds: Susquehanna, Potomac, and James. Control of nutrients from these major watersheds, especially the Susquehanna, should result in a restored nutrient balance in the Bay. Nutrient concentrations and river discharges showed interesting relationships which were found to be dependent on several factors, i.e., particular nutrient within a particular watershed, time of the year, and weather conditions which affected normal river discharge. Most of the water quality problems are similar to those in other comparable areas of the United States but are compounded because the area is largely tidal. Identification of the Susquehanna River as the major contributor to the Chesapeake Bay's nutrient load resulted in the implementation of an intensive nutrient survey within the Susquehanna Basin to locate individual sources and their degree of controllability. (Jones-Wisconsin)

AN ENVIRONMENTAL REFERENCE FOR THE CONSTRUCTION INDUSTRY,
Indiana Univ., Bloomington. Poplars Research and Conference Center.
P. Grills.
School of Public and Environmental Affairs Report, December 1974. 141 p.

Descriptors: *Environmental effects, *Pollution abatement, *Construction, *Industries, Legislation, Regulation, Economics, Bibliographies, Social aspects, Political aspects, Government finance, Grants, Construction materials, Indiana, Air pollution, Water pollution control, Standards, Permits.
Identifiers: *Construction industry, Construction sites.

Many construction operations are conducted on a project site. Usually the adverse effects of these operations can be minimized by assessing each operation for its potential effect on the natural environment, and taking the necessary precautions to prevent unwarranted damage. Federal and state statutes and regulations designed specifically for protection of the natural environment are discussed which deal only with the more salient features of the control scheme most directly affecting the construction industry. Statutory authority for regulatory powers, agencies responsible for administration, pertinent regulations, and the status and progress of future regulations are identified. The design and planning phase of construction must be familiar with the technology employed to meet environmental standards, environment impact statements, and necessary environmental permits and licenses. The impact of regulation will be determined by the industry's ability to adapt to its changing environment. Many of the more critical regulations, especially for control of runoff from construction sites are not yet promulgated. The industry should assist in developing these regulations by creating a good liaison with controling agencies. Educational programs could be developed. Possible sources for financial and program assistance are listed, and a bibliography is included. (Jones-Wisconsin)

LOST AND LIVING LAKES IN THE UPPER UME VALLEY,
G. Wassen.
Acta Phytogeographica Suecica, Vol 50, p 233-239, 1965. 5 fig.

Descriptors: *Lakes, *Vegetation, *Reservoirs, Shores, Alpine, Water level fluctuations, Algae, Aquatic plants.
Identifiers: *Sweden, *Ume River Valley(Sweden), Gardiken Reservoir(Sweden), Ajaure Lake(Sweden), Gautajaure Lake(Sweden), Lake Tarnasjon(Sweden), Lake Stora Umevattnet(Sweden).

The upper course of the Ume River, Sweden was studied, especially its shore vegetation. The woods around Lake Gardiken, a reservoir combining six lakes, are typical of the conifer forests of the prealpine subregion. The prevailing habitat conditions on the shores corresponded to the alpine environment. The most conspicuous zonation and richest in species was the Calluna belt. The adjacent Vaccinium vitis-idaea belt had a number of local preferential species. Through a gigantic dam was under construction in 1965, the two lakes, Ajaure and Gautajaure, will be combined. Drained through an eastern tributary, the remote lake, Tarnasjon, lies in an uninhabited area east of high-alpine summits with small glaciers. In the absence of Calluna, the part of the geolittoral corresponding to the Calluna belt is dominated by Nardus stricta, Cassiope hypnoides, and Vaccinium uliginosum. The source lake of the main river, Lake Stora Umevattnet, was unique for multiplicity in edaphical conditions and floristic richness, notable in cryptograms. Damming this lake in 1965 is one of the great sacrifices forced upon nature by technical development. (Jones-Wisconsin)

EFFECTS OF A SULPHATE PULP MILL ON THE BENTHIC MACROFAUNA IN A FIRTH OF THE BOTHNIAN SEA,
Swedish Water and Air Pollution Research Lab., Stockholm.
R. Rosenberg, K. Nilsson, and L. Landner.
To be published in 'Merentutkimuslait. Julk./Havsforskningsinst. Skr, Finland.' January 1974. 11 p, 7 fig, 2 tab, 14 ref.

Descriptors: *Water pollution effects, *Benthic fauna, *Estuaries, *Sulfates, Pulp wastes, Brackish water, Mercury, Dominant organisms, Distribution, Clams, Amphipoda, Oligochaetes, Diptera, Crustaceans.
Identifiers: *Natrafjarden Firth(Bothnia Sea), Sweden, Finland, Pontoporeia affinis, Macoma baltica, Mesidothea entomon.

Study was made of the effect of waste water from a sulphate pulp mill at Kopmanholmen, Sweden on the Natrafjarden Firth on the Gulf of Bothnia on benthic macrofauna. Physical and chemical parameters were determined. The organic wastes were transported in the surface water and oxygen depletion was not observed during the investigative period 1969-72. In August 1972 a total number of 32 stations were sampled in Natrafjarden and one station outside that area. Depths at these stations were between 5 and 57 m and more than 15,000 specimens were collected. No macrofauna was found at the 12 innermost stations of Natrafjarden due to heavy pollution. Four communities were distinguished with respect to depth and pollution. The most frequently found species were Pontoporeia affinis, Macoma baltica and Mesidothea entomon; the latter two were most tolerant to pollution. Faunal comparisons with other polluted areas are discussed. The highest diversity and biomass were found in shallow areas above 20 m in Natrafjarden and off the SW coast of Finland. In contrast, the highest diversity and biomass are generally found at greater depths in more saline waters. (Jones-Wisconsin)

PHYTOPLANKTON: GRASS OF THE SEA,
Oregon State Univ., Newport. Dept. of Oceanography.
H. Curl, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-74-10454, $3.00 in paper copy, $2.25 in microfiche. Marine Advisory Program Sea Grant No. 9, December 1973. 4 p, 6 fig, 5 ref.

Descriptors: *Marine algae, *Food chains, Fish, Phytoplankton, Diatoms, Dinoflagellates, Cyanophyta, Productivity, Water pollution effects.

A murky green or amber appearance in nearshore coastal waters is almost always due to the presence of many small, single-celled plants called phytoplankton. From carbon dioxide and water, by photosynthesis, they produce more organic matter than any other plants and they release amounts of oxygen proportional to the carbon dioxide they use. Without this production, not only would there not be any food for grazing and filter feeding animals in the ocean but there would be no fish, which feed on the smaller grazers. On most westward-facing coastlines in all parts of the world, massive phytoplankton growths, called blooms, occur. Plants comprising phytoplankton are of many different species, all microscopic in size. Usually the most abundant are diatoms. The second most abundant organisms are dinoflagellates. Nearly all of the phytoplankton species are used as food by small invertebrate animals that feed by filtering the water. The total amount of marine food produced depends on the annual rate of production of phytoplankton, the type of organisms we can economically harvest and find edible, and on the number of steps in between. (Jones-Wisconsin)

ALGAE FROM LAKES IN NORTHERN COLORADO,
Vaxtbiologiska Institutionen, Uppsala (Sweden).
K. Thomasson.
Svensk Botanisk Tidskrift, Vol 58, No 1, p 73-80, 1964. 1 fig, 1 tab, 16 ref.

Descriptors: *Systematics, *Algae, *Lakes, *Colorado, Plankton, Benthos, Diatoms, Nutrients, Bottom sediments, Detritus, Chemical properties, Physical properties.
Identifiers: Carter Lake(Colo), Redrock Lake(Colo), Brainard Lake(Colo), Long Lake(Colo), Lake Isabelle(Colo), Desmids, Mountain lakes.

These notes are based on five plankton samples, one from each of five lakes. Carter Lake is an eight-year old artificial lake in Colorado, in the extensive Colorado-Big Thompson Water Conservation System. Redrock Lake is a semidrainage 'nitrogen-accumulator'. Brainard Lake is an artificial lake made in 1892 by damming a creek. Long Lake, one of the larger natural lakes of the area, is located in a U-shaped valley. Lake Isabelle is a typical mountain tarn, with the Continental Divide in the immediate background. Summing up results from these random samples, the plankton of Carter Lake is entirely different from that of the mountain lakes, and is characterized by predominance of Fragilaria crotonensis and Asterionella formosa. Among the planktic desmids only Staurastrum longipes and S. planctonicum occur in significant quantities. On the other hand, desmids are numerous in the samples from the mountain lakes, even if the benthic taxa are not considered. In the four mountain lakes the population of planktic diatoms is markedly lower than in Carter Lake. Lake Isabelle, at the highest elevation, has the poorest plankton, the shortest growing season, lowest summer maximum temperatures, and lowest supply of nutrients due to its small drainage area. (Jones-Wisconsin)
W74-12666

THE MAJOR RIVERS OF NORTHERN SWEDEN,
N. Quennerstedt.
Acta Phytogeographica Suecica, Vol 50, p 198-204, 1965. 3 fig.

Descriptors: *Rivers, *Aquatic plants, *Distribution, Vegetation, Algae, Lichens, Diatoms, Water level fluctuations, Cyanophyta, Chlorophyta, Rhodophyta, Turbulent flow.
Identifiers: *Sweden, Torne River(Sweden), Kalix River(Sweden), Pite River(Sweden).

Of the twelve large northern Sweden's main rivers, only three have not been changed by hydroelectric development. These are the Torne, the Kalix, and the Pite rivers. Vascular vegetation, inhabiting finer sediments and especially the mud bottoms of slack-water reaches, mostly consists of long-shoot plants, such as Potamogeton gramineus, P. perfoliatus and Myriophyllum alterniflorum; Sparganium is usually present and S. angustifolium, probably the most common species, together with its hybrid with S. Friesii are recognized in several rivers. Isoetids are frequently found and Isoetes lacustris is usually predominant. In the large main rivers, reeds--Phragmites--occur sporadically and likewise Scirpus lacustris, none of these existing in large colonies. Equisetum fluviatile, on the other hand, grows abundantly, particularly on the fine-grained riverbeds. One species of macro-algae, Nitella opaca, is fairly common in the main rivers. The algae occurring at the different seasons especially at flood time and the following dry seasons are listed. It would seem that the Torne River shows a greater differentiation in the total range of vegetation than most of the other north Swedish rivers, and vegetation of a distinct eutrophic trend is sometimes encountered. (Jones-Wisconsin)
W74-12668

STUDIES ON PHYTOPLANKTON PIGMENTS IN PORTO NOVO WATERS (INDIA). II. BACKWATER,
Marine Biological Station, Porto Novo (India).
K. Krishnamurthy, and V. Sundararaj.
Journal of Experimental Marine Biology and Ecology, Vol 14, No 3, p 285-294, 1974. 6 fig, 1 tab, 17 ref.

Descriptors: *Phytoplankton, *Pigments, Backwater, Chlorophyll, Seasonal, Neritic.
Identifiers: *Porto Novo(India), Bay of Bengal, Carotenoids, Phaeopigments, Noctiluca, Coscinodiscus, Thalassiothrix, Biddulphia, Hemidiscus, Melosira, Rhizosolenia.

The Backwater in Porto Novo, India waters exposes areas of very fertile mudflats which contain mostly sedentary and semi-sedentary organisms. Rich and fertile oyster beds are dominant formations. The fresh water flow in the system is largely through rivulets, irrigation channels, and seasonal freshwater discharges through the Vellar Estuary. The annual cycle of phytoplankton pigments and characteristics of their distribution are presented. Chlorophyll-a varied from 2.91-65.56 micrograms/l, chlorophyll-b from 0-1.90 micrograms/l, chlorophyll-c from 0-38.60 micrograms/l, plant carotenoids from 0.30-22.34 MSPU/cu m, and phaeopigments from 0-31.51 micrograms/l. Primary maximum of chlorphyll-a appeared during June at Stations 3-5 and during May at Station 6. Stations 3 and 4 had secondary chlorophyll-a maxima during September and Stations 5 and 6 during August. In general, all the stations showed an increasing trend of chlorophyll-a values before the main peak. The chlorophyll maximum was mainly due to the presence of phytoplankton species belonging to the genera Noctiluca, Coscinodiscus, Thalassiothrix, Biddulphia, Hemidiscus, Melosira and Rhizosolenia. Chlorophyll-a concentration was normally affected by rainfall. (Jones-Wisconsin)
W74-12669

DIATOMS IN THE LAKE VEGETATION OF THE LANGAN DRAINAGE AREA, JAMTLAND, SWEDEN (DIATOMEERNAILANGANS SJOVEGETATION),
Vaxtbiologiska Institutionen, Uppsala (Sweden).
N. Quennerstedt.
Acta Phytogeographica Suecica, Vol 36. 208 p, 39 fig, 15 tab, 370 ref. English summary.

Descriptors: *Diatoms, *Lakes, *Vegetation, Water level fluctuation, Plankton, Benthos, Geology, Fish, Aquatic plants, Mosses, Crustaceans, Rotifers, Phytoplankton, Cyanophyta, Watersheds(Basins), Systematics, Physical properties, Chemical properties, Alpine, Algae, Geologic history.
Identifiers: *Sweden, Jamtland(Sweden), Mountain lakes, Langan River(Sweden).

Biological investigations in the Langan district of western Jamtland, Sweden were undertaken to preserve a record of the plant and animal life existing in a mountain lake system destined for water storage purposes. These investigations have chiefly been directed towards the vegetation with emphasis on the diatoms which are catalogued. The physical and chemical characteristics of the lakes and the topography, geology, climate of the Langan drainage area are given. Of the Langan lakes, Ovre Oldsjon has been studied best. The vascular plant vegetation is characterized most by isoetides predominated by Isoetes lacustris. A characteristic of the lake's vegetation are submersed mosses. In general, Crustacea and Rotifera are predominate in the plankton; the phytoplankton is quantitatively small. The dominant benthic algal vegetation is composed of Cyanophyceae and diatoms. Vertical sections of sediment in southern Ovre Oldsjon were taken and a relative chronology was evolved with the aid of pollen diagrams. The postglacial history of Ovre Oldsjon shows the trend is toward a lower trophic standard, a meiotrophication. (Jones-Wisconsin)
W74-12670

LAKE VATTERN. OUTLINES OF ITS NATURAL HISTORY, ESPECIALLY ITS VEGETATION,
Uppsala Univ. (Sweden). Inst. for Plant Ecology.
N. Salberg.
Acta Phytogeographica Suecica, Vol. XI, 1939. 60 p, 1 fig, 8 plates, 74 ref.

Descriptors: *Lakes, *Vegetation, Geologic history, Temperature, Algae, Aquatic plants, Chara, Hydrography, Chemical properties, Algae, Zooplankton, Physical properties.
Identifiers: *Lake Vattern(Sweden), Transparency.

A survey is presented of Lake Vattern, Sweden, a lake especially interesting because of its clarity, its great depth, stormy character, and the play of colors in its waters. Records go back to 1664. Its 1900 square kilometers fill a fault in the earth's crust, and it has an alternately lacustrine and marine postglacial history. The higher vegetation and algae descend deeply into the lake. Nitella opaca was lowered to depths varying from 4-20 m. The percentage of oxygen was constant at a depth of about 10 m. When a continuous southerly wind prevails there accumulates in northern Vattern a relatively homothermal layer of warm epilimnetic water, the thickness of which sometimes reaches the bottom. Then the southern parts are cooled and they have 'bottom temperature'; when the wind is from the north, the opposite is true. Chemical analyses were made. The algae from the southern part near Jonkoping collected in July-August 1898, are reprinted. Common plankton species are listed. Phytogeographical distribution and some phytogeographically interesting species, the vascular vegetation of southern, middle and northern Vattern, flora and vegetation of Characeae, and flora and vegetation of epilithic algae are all given. (Jones-Wisconsin)
W74-12671

SALT MARSH VEGETATION IN SOUTHERN SWEDEN,
V. Gillner.
Acta Phytogeographica Suecica, Vol 50, p 97-104, 1965. 3 fig, 15 ref.

Descriptors: *Salt marshes, *Vegetation, Salinity, Brackish water, Littoral, Shares, Aquatic plants.
Identifiers: *Sweden.

The Swedish salt marsh is rather narrowly defined to include only the plant life of the geolittoral zone. The terrestrial meadow immediately above and the hydrolittoral immediately below this belt are considered and briefly discussed as contact vegetation. First the salt marsh vegetation of the west coast is described and compared with the salt marsh farther south, on the Oresund. The composition of brackish meadow vegetation along the east coast south of and within the Kalmarsund area is briefly touched upon. Further northwards the marshes become increasingly like freshwater ones, but some marine species occur all around the Gulf of Bothnia. A survey showed that the salt marsh vegetation is most varied at the west coast, where habitat conditions offer the widest range. In their most typical form the salt marshes of the west coast resemble those of the North Sea coast, though in a much smaller scale and with rather fewer species. Locally freshwater seepages may give rise to similarities with the brackish marshes of the Baltic. Each of the three areas described, the west coast, Oresund and the southern Baltic coast, has certain floristic peculiarities of its own. (Jones-Wisconsin)

NOTES ON ALGAL VEGETATION OF LAKE KARIBA,
Vaxtbiologiska Institutionen, Uppsala (Sweden).
K. Thomasson.
Nova Acta Regiae Societatis Scientiarum Upsaliensis, Ser IV, Vol 19, No 1, p 3-34, 1965. 13 fig, 2 tab, 107 ref.

Descriptors: *Algae, *Tropical regions, *Systematics, Plankton, Diatoms, Lakes, Water analysis, Thermal stratification, Aquatic life.
Identifiers: *Lake Kariba(Rhodesia), Salvinia auriculata.

The algae and other aquatic life of tropical Lake Kariba, located between Zambia and Northern Rhodesia, is described. The lake's surface temperature varies between 23 and 29C. Physical measurements and results of chemical analyses are given. The main stress was laid on desmids but members of other groups were studied to some extent and a few notes on animals are included. Only a few diatoms are listed. The most imposing feature was the explosive growth of Salvinia auriculata, which covered more than 23,000 ha of the lake surface by the end of 1959 and more than 67,000 ha in early 1960. The character of the algal flora is unmistakably tropical. Plankter and tychoplankter distribution is given and is compared with their occurrence in Lake Bangweulu in northern Zambia. Some taxonomical comments, with illustrations, are made on about 70 algae and animals. (Jones-Wisconsin)

ENVIRONMENTAL POLLUTION BY FLUORINE WITH RESPECT TO THE PROSPECTIVE ALUMINUM FACTORIES IN KYUSHU, JAPAN (IN JAPANESE),
Kagoshima Univ. (Japan). Dept. of Chemistry.
T. Onishi.
Sci Rep Kagoshima Univ. 21, p 45-55. 1972. Illus.

Descriptors: *Aluminum, Environment, Industrial plants, *Fluorine, *Water pollution sources, Air pollution.
Identifiers: Japan, Kyushu.

In view of the aluminum electrolyte smelting factories planned to be established in the area, distribution and sources of fluorine in Kyushu, Japan, were studied. Fluorine levels in the rain, air, volcanoes and rivers were studied. The area was a highly fluorine-polluted area. Effects of fluorine on humans and plants were also studied. Such fluorine-related symptoms as excessive bone growths, liver and kidney disorders and spotted teeth in humans have not yet been reported in the area. Measures should be taken against possible effects of fluorine before the establishment of the factories.--Copyright 1973, Biological Abstracts, Inc.

LEPTOSPIROSIS: AN EPIDEMIC IN CHILDREN,
Center for Disease Control, Atlanta, Ga. Epidemiology Program.
R. M. Barkin, and J. W. Glosser.
Am J Epidemiol. Vol 98, No 3, p 184-191. 1973. Illus.

Descriptors: *Water pollution effects, *Diseases, *Human diseases, *Animal diseases, Domestic animals, Public health, *Epidemics storm runoff, *Texas.
Identifiers: Children, Dogs, Leptospira-canicola, *Leptospirosis, Texas.

Leptospirosis (7 cases) caused by serotype (Leptospira) canicola occurred in Baytown, Texas, in the summer of 1971. The 1st case was in a 1.5-yr-old child who became ill on July 4. The subsequent cases occurred between Aug. 12 and 15 in children 4 - 15 yr of age. All the children were members of a large family living in a trailer camp. The children had similar symptoms. All cases were serologically confirmed, and leptospires were isolated from urines of 3 children. The family's pet dogs were also infected with (L) canicola. Isolates from the children and the dogs were identical to (L) canicola Hond Utrecht. The infected children and dogs played in pools of water caused by heavy rains. Direct and indirect transmission of leptospires probably occurred in this epidemic.--Copyright 1974, Biological Abstracts, Inc.

VEGETATIONAL ZONATION IN TWO SUCCESSIONAL BRACKISH MARSHES OF THE CHESAPEAKE BAY,
Duke Univ., Durham, N.C. Dept. of Botany.
M. G. Flowers.
Chesapeake Sci. Vol 14, No 3, p 197-200. 1973. Illus.

Descriptors: *Maryland, Aquatic life, Aquatic plants, Wetlands, *Salt marshes, Marsh plants, Brackish water, *Chesapeake Bay, *Vegetation.
Identifiers: Depth, Height, Marshes, Salinity, Scirpus-olneyi, Scirpus-robustus, Spartina-alterniflora, Typha-angustifolia, Soil depth, Tidal heights.

Vascular plant zonation and successional stages were studied in 2 brackish marshes of Calvert County, Maryland. One marsh is mature and stable, while the other is undergoing rapid succession from a former lake bottom. Soil depth, water salinity, and tidal heights were measured. Transect surveys show a general zonation of Spartina alterniflora to Scirpus olneyi to upland vegetation in the stable marsh and a Spartina alterniflora to Scirpus robustus to Typha angustifolia to upland vegetation succession in the developing marsh. Elevation of the marsh relative to mean high water is the most obvious factor influencing the plant distribution.--Copyright 1974, Biological Abstracts, Inc.
W74-12689

ECOLOGY AND PRODUCTION OF JUVENILE SPRING CHINOOK SALMON, ONCORHYNCHUS TSHAWYTSCHA, IN A EUTROPHIC RESERVOIR,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
D. L. Higley, and C. E. Bond.
U S Natl Mar Fish Serv Fish Bull. Vol 71, No 3, p 877-891. 1973. Illus.

Descriptors: Fish, Aquatic life, Juvenile fish, Fry, Fish stocking, Fish hatcheries, Fish genetics, Fish reproduction, Salmon, Toxins, Fish toxins, Salmonids, *Oregon, *Chinook salmon.
Identifiers: Chaoborid, Entomostraca, Oncorhynchus-kisutch, Oncorhynchus-tshawytscha, Reservoirs, Juvenile salmon, Rearing sites.

Juvenile spring chinook salmon, Oncorhynchus tshawytscha, were reared in a central Oregon reservoir of 7.5 ha. The reservoir is strongly eutrophic, as shown by its heavy sedimentation, summer stratification and chemical qualities (total dissolved solids over 200 ppm, total P to 0.4 ppm and summer pH between 9 and 10). Surface water temperatures ranged from 3-29 degrees C. Salmon were apparently confined to the upper 3 m during the summer because of low dissolved oxygen below this depth. In 1961, epilimnion conditions of high pH, high temperatures, decreasing oxygen concentrations and possibly algal toxins caused condition loss and deaths among salmon. Fry planted in 1961 (75,300) and in 1962 (150,000) suffered 1st-summer mortalities in excess of 80%, primarily due to predation by older salmon. Summer growth was rapid, but dependent on population densities. Coho salmon, O. kisutch and chinook salmon remaining from a 1959 plant averaged 280 and 215 g after 3 mo. The 1961 year class averaged 62 g at 10 mo. and 89 g at 22 mo. The 1962 year class averaged 22 g at 9 mo. Average condition factor values rose above 1.20 in the summer. Net production by the 1961 year class was 159 kg/ha in 1962. The 1962 year class produced 170 kg/ha in 1962. Potential Dec. yield of 1st-yr salmon was 98 kg/ha in 1961 and 73.5 kg/ha in 1962. First-year salmon are primarily Entomostraca and chaborid larvae. Apparently competition from the 1962 year class caused the 1961 year class to feed more on littoral and terrestrial forms and to grow and produce less in their 2nd year. Age class I and age class II salmon weighing from 25-189 g emigrated via spillway outflows. In 1963, migrations occurred only at temperatures above 10 degrees C; this relationship was not observed in 1962. This reservoir, or others with similar limnological conditions, cannot be recommended as a rearing site for chinook salmon because of the severe summer conditions.--Copyright 1974, Biological Abstracts, Inc.

PRIMARY PHYTOPLANKTON PRODUCTIVITY IN THE EASTERN MURMAN BAYS, (IN RUSSIAN),
Murmanskii Morskoi Biologicheskii Institut (USSR).
A. A. Solov' eva.
Gidrobiol Zh. Vol 9, No 4, p 14-19. Illus. 1973. English summary.
Identifiers: Bays, Chaetoceros-compressus, Chaetoceros-subsecundus, *Chlorophyll, Diatoms, Eastern, Flagellates, Fragilaria-oceanica, Murman, Nitzschia-seriata, *Phytoplankton, *Primary productivity, Russian-SFSR: Salinity, Skeletonema-costatum, Thalassiosira-nordenskioldii, *USSR(East Murman bays), *Eutrophication.

Qualitative and quantitative phytoplankton composition, the chlorophyll content, and organic substances appearance in the superficial layer of 2 East Murman Bays (Russian SFSR, USSR) are considered. Two peaks are pointed out in the phytoplankton development, depending on 2 essential algae groups: diatoms (Fragilaria oceanica, Thalassiosira nordenskioldii, Chaetocerus compressus, C. subsecundus, Skeletonema costatum, Nitzschia seriata), and diatoms and small flagellates. The late summer peak in one of the bays is a result of freshening of the water. Dependence was found between phytoplankton productivity, chlorophyll a content and the phytoplankton cell number.--Copyright 1974, Biological Abstracts, Inc.

THE RELATIONSHIP OF BACTERIA AND BLUE-GREEN ALGAE, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Inst. of Microbiology.
L. E. Mikhailenko, and I. Ya. Kulikova.
Gidrobiol Zh. Vol 9, No 2, p 52-59. 1973. Illus.
Identifiers: Algae, Aphanizomenon, *Bacteria, Microcystis, Plankton, *Cyanophyta, Eutrophication.

The number of total bacteria and saprophytic bacteria in the Kiev and Kremenchug Reservoirs (USSR) reached peaks in the spring and the summer-fall period. The 1st increase was associated with the presence of large amounts of allochthonous microflora, the 2nd with favorable temperatures and the massive 'blooming' of phytoplankton which released many biogenic substances. Bacterial development was directly linked to phytoplankton content and the amount of organic matter. The bacteria count in the seston was determined in surface layers associated with blooming of Microcystis and in some cases Aphanizomenon. The amount of bacterial biomass increased with aging and dying of the algae. The number of saprophytic bacteria mineralizing proteins was counted in the range of millions and tens of millions of cells/g of seston. The values were much higher than those obtained for soil from these waters. The data indicate that Microcystis and Aphanizomenon at all stages of development are good substrates for bacteria and contradict theories on the bactericidal effect of algae.--Copyright 1974, Biological Abstracts, Inc.

MERCURY IN AQUATIC BIRDS AT CLAY LAKE, WESTERN ONTARIO,
Canadian Wildlife Service, Edmonton (Alberta).
K. Vermeer, F. A. J. Armstrong, and D. R. M. Hatch.
J Wildl Manage. Vol 37, No 1, p 58-61. 1973.
Identifiers: *Canada(Clay Lake), *Mercury, *Toxicity, Birds, Clay Lake, *Water birds.

Total Hg levels ranging from 2-16 ppm in eggs did not appear to affect the hatching and fledging of herring gulls (Larus argentatus). Hg levels in breast muscles of 5 American widgeons (Mareca americana), 16 mallards (Anas platyrhynchos), 17 blue-winged teals (Anas discors), 21 common goldeneyes (Bucephala clangula), 17 common mergansers (Mergus merganser) and 7 hooded mergansers (Lophodytes cucullatus) averaged 0.5, 6.1, 6.5, 7.8, 6.8, and 12.3 ppm respectively at Clay Lake (Ontario, Canada) 4-6 wk prior to the hunting season in 1971. Methyl Hg in 5 ducks ranged from 69 - 99% of total Hg. Crayfish (Orconectes virilis) muscle contained the highest Hg levels of food items found in esophagi and stomachs of ducks. The high values in breast muscles of hooded mergansers are likely related to their feeding on crayfish.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Salmon *Sockeye salmon, Juvenile fish, *Alaska, United States, Smolt, Freshwater fish, *Diseases.
Identifiers: Anisakis, Bolbosoma-caenoforme, Brachyphallus-crenatus, Contracaecum, Diphyllobothrium, Diplostomulum, Echinorhynchus-gadi, Eubothrium-salvelini, Gyrodactyloides-strelkowi, Helminths, Lecithaster-gibbosus, Neoechinorhynchus-rutili, Oncorhynchus-nerka, Philonema-oncorhynchi, Phyllobothrium-caudatum, Proteocephalus, Rhabdochona, Triaenophorus-crassus, Tubulovesicula-lindbergi, Kvichak River, *Bristol Bay(Alas).

A study of helminths infecting juvenile and adult sockeye salmon (O. nerka) leaving and entering the Kvichak River system, Bristol Bay, Alaska (USA) was conducted in 1969. Ten helminths acquired in fresh water were found in smolts: Diplostomulum sp.; an unidentified trematode; Diphyllobothrium spp.; Triaenophorus crassus Forel, 1868; Proteocephalus sp.; Eubothrium salvelini (Schrank, 1790); Neoechinorhynchus rutili (Mueller, 1789); Philonema oncorhynchi Kuitunen-Ekbaum, 1933; Rhabdochona sp.; and Contracaecum sp. In addition to surviving larval stages of freshwater parasites, adults were infected by 9 helminths acquired in the sea: Gyrodactyloides strelkowi Bykhovskaya and Polyanskaya, 1953; Lecithaster gibbosus (Rud., 1802); Brachyphallus crenatus (Rud., 1802); Tubulovesicula lindbergi (Layman, 1930); Phyllobothrium caudatum (Zschokke and Heitz, 1914); Echinorhynchus gadi Mueller, 1776; Bolbosoma caenoforme Heitz, 1920; Anisakis sp.; and Contracaecum sp. Infection incidences and intensities are tabulated where accurate data are available. Information on life histories is assembled from scattered sources, and some ecological aspects of helminths infecting Kvichak sockeye salmon are briefly discussed.--Copyright 1974, Biological Abstracts, Inc.

STUDIES ON THE ANEMIA OF FISH: V. DIETARY IRON DEFICIENT ANEMIA IN BROOK TROUT, SALVELINUS FONTINALIS,
Freshwater Fisheries Research Lab., Tokyo (Japan).
H. Kawatsu.
Bull Freshwater Fish Res Lab. Vol 22, No 1, p 59-67. 1972. Illus.
Identifiers: *Anemia(Fish), Salvelinus-Fontinalis, *Fish disease, Brook trout, Fish diets.

Hematological observation was made on the brook trout fed on a synthetic diet in which Fe was excluded from mineral supplements. The anemia induced by dietary iron deficiency was characteristic of the hypochromic microcytic anemia. The decrease rate of Hb was larger than the red blood cell count and hematocrit. The latent period was found before the MCHC (mean corpuscular concentration) drastically decreased. In the recovery test, the MCHC reached the initial level within 3 wk and the MCV (mean corpuscular volume) within 6 wk. The percentage of immature erythrocytes did not decrease under the conditions of Fe deficiency. Regarding the leukocytes, no recognizable changes were observed in relation to Fe deficiency.--Copyright 1973, Biological Abstracts, Inc.

STUDIES ON GILL PARASITOSIS OF THE GRASSCARP (CTENOPHARYNGODON-IDELLA) CAUSED BY DACTYLOGYRUS LAMELLATUS ACHMEROV, 1952: IV. HISTOLOGICAL CHANGES,
K. Molnar.
Acta Vet Acad Sci Hung. Vol 22, No 1, p 9-24. 1972. Illus.
Identifiers: *Carp, Ctenopharyngodon, Dactylogyrus, Necorsis, Parsitosis, *Fish parasites, *Grasscarp.

Gills of healthy grasscarps (C. idella) and specimens infected with D. lamellatus were examined. The anatomical and histological structure of normal branchial lamellae is described to aid diagnostic comparison. Establishment of D. lamellatus parasites on the gill lamellae gives rise to local and general lesions. The local lesions comprise erosions, endothelial impairment and minor areas of cell degeneration around the site of attachment of the parasite. The general gill lesions include degeneration, tissue damage, hemorrhages, necrosis, atrophy and cell proliferation. The nature of the lesions depends on the duration of the disease, the number of parasites established on the gill and the extent of regeneration. If the infection takes a rapid course, the typical lesion is degeneration of the respiratory plate epithelium. In acute dactylogyrosis this is compensated by proliferation of the cuboidal cells of the lamellar epithelium which results in the disappearance of respiratory plates, process-like transformation and adhesion of the lamellae. If the condition is chronic, the respiratory epithelium becomes damaged, the epithelium atrophies and the lamellae necrotize but there is only a local degeneration.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

METABOLISM OF COMPONENTS OF EXTENDED AERATION ACTIVATED SLUDGE,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
A. F. Gaudy, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 636, $5.00 in paper copy, $2.25 in microfiche. Oklahoma Water Resources Institute, Stillwater, Completion Report, (1974). 172 p, 6 append. OWRT A-035-OKLA(3) 14-31-0001-4036.

Descriptors: *Waste water treatment, *Aeration, Microbial degradation, Oxidation, *Hydrolysis, *Activated sludge, *Biological treatment, *Metabolism, Microorganisms, Cytological studies, Pilot plants.
Identifiers: *Extended aeration.

The use of biological cells and/or their individual cell components as substrates by other microorganisms was investigated. The utilization of microorganisms as substrates concurrently with performance of their functions as substrate users is the basic concept upon which the extended aeration or total oxidation process is based. This aspect was investigated directly by growing, in pure culture, cells which produced copious amounts of extracellular polysaccharide, harvesting polysaccharide and feeding it as sole source of carbon to heterogeneous microbial populations of sewage origin. After a period of acclimation, heterogeneous microbial populations could be developed which metabolized this extracellular polysaccharide material very rapidly. Long-term pilot plant studies were undertaken in which the 'hydrolytic assist' to an extended aeration process was examined. The 'hydrolytic assist' involves withdrawing some cells and performing chemical hydrolysis in order to solubilize some of the macromolecules. This portion of the sludge is then recycled as essentially liquified sludge along with intact cells. Long-term plant experiments were run to determine if this mode of operation could provide for adequate control of biological solids concentration and permit the system to retain its nitrifying characteristics as well as high substrate removal capability. Such a process was indeed feasible. Aspects of cell maintenance were examined; model equations for biological solids concentration and effluent substrate concentration would be improved with respect to prediction of excess biological sludge or cell output by the inclusion of a term for cell maintenance.

COMPUTER MANAGEMENT OF A COMBINED SEWER SYSTEM,
Municipality of Metropolitan Seattle, Wash.

C. P. Leiser.
Copy available from GPO Sup Doc as EP1.23:670/2-74-022, $5.30; microfiche from NTIS, Springfield, Va 22161 as PB-235 717, PC$8.30, $2.25 microfiche. Environmental Protection Agency, Cincinnati, Ohio, Technology Series, Report EPA-670/2-74-022, July 1974. 474 p, 108 fig, 49 tab, 51 ref, 13 append. EPA Project 11022 ELK. Program Element 1BB034/ROAP 21-ASZ/TASK 37.

Descriptors: *Computer programs, *Flow control, *Overflow, *Combined sewers, *Operating costs, *Remote control, *Computer models, Flow measurement, Mathematical models, Storm runoff, Runoff, Water pollution, *Waste water treatment, Sampling, Storage tanks, Telemetry, Monitors, Construction, Maintenance, *Washington.
Identifiers: *Flow regulators, Computer control, In-sewer storage, *Seattle(Wash), Systems management, Systems control.

At the conclusion of a ten-year construction program which affected much of Seattle's combined sewer system, a computer-controlled 'total systems management' complex was proposed, funded and constructed. Computer augmented treatment and disposal (CATAD) takes advantage of storage in the sewers to limit overflows, and selects overflow points based on water quality data. Since the control system began operating in 1971, receiving water quality, especially dissolved oxygen and coliform levels, has shown significant improvement; overflow volume has decreased by 50 to 60 percent during supervisory control and in excess of 90 percent during three months of limited automatic control. Eight pollution loading parameters were measured and found to be 68 percent less than before advanced control techniques. Capital costs totaled $2.6 million for the control system at the 36 remote stations, or $5.3 million, including construction of 15 gate-driven regulator stations. Annual maintenance and operation costs totaled $270,000. The system is worth roughly $40 to $245 million in equivalent sewer separation. Work continues on a fully automatic optimizing model to add predicative capability to program decisions so the system could maintain an 80 percent overflow reduction. (See also W72-08984) (EPA)

HIGH-RATE LAND TREATMENT I: INFILTRATION AND HYDRAULIC ASPECTS OF THE FLUSHING MEADOWS PROJECT,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
H. Bouwer, R. C. Rice, and E. D. Escarcega.
Journal of the Water Pollution Control Federation, Vol 46, No 5, p 834-843, May 1974. 3 fig, 5 tab, 11 ref.

Descriptors: *Infiltration rates, *Flooding, Basins, Effluents, Irrigation, Recreation, *Water reuse, Hydraulics, Aquifers, Groundwater, Flow, Sewage effluents, *Tertiary treatment, *Arizona.
Identifiers: High-rate infiltration, Flushing Meadows Project, Phoenix(Ariz).

An experimental high-rate land treatment system, the Flushing Meadows project, was initiated to study renovation of secondary sewage effluent for irrigation, recreation, and some industrial uses. The project attempted renovation through high-rate infiltration basins in the bed of the Salt River. It was found that infiltration rates decreased linearly during flooding and were restored sigmoidally during drying of the basins. One acre of basin area could renovate 0.36 mgd of effluent due to a hydraulic loading of 400 feet per year obtained by 20 to 30-day flooding periods alternated with 10-day drying periods in summer and 20-day drying periods in winter. The bottom condition most desirable for high infiltration rates was mature grass stand, followed by bare soil and then gravel. A deep, nonvegetated basin is thought to be most condusive to high infiltration rates. A uniform, anisotrophic aquifer was assumed and showed good agreement with horizontal and vertical hydraulic conductivities obtained by a resistance netowork analog from groundwater level response to recharge and those obtained by well tests. The existence of active and passive flow regions was inferred by the effective transmissibility for recharge of twelve percent of the transmissibility for the entire saturated height of the unconfined aquifer. The hydraulic conductivity of the aquifer was not noticably affected by groundwater recharge with sewage effluent. (See also W74-12005) (Murphy-FIRL)
W74-12004

HIGH-RATE LAND TREATMENT II: WATER QUALITY AND ECONOMIC ASPECTS OF THE FLUSHING MEADOWS PROJECT,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
H. Bouwer, J. C. Lance, and M. S. Riggs.
Journal of the Water Pollution Control Federation, Vol 46, No 5, p 844-859, May 1974. 9 fig, 3 tab, 15 ref.

Descriptors: *Water quality, *Costs, *Filtration, *Secondary treatment, Suspended solids, *Arizona, *Water reuse, Biochemical oxygen demand, Coliforms, Flooding, Nitrogen, Recycling, Recreation, Irrigation, Water reuse, Ammonium, Tertiary treatment, Hydrogen ion concentration.
Identifiers: *Hydraulic loading, Organic carbon, *Phoenix(Ariz).

Water quality and economic aspects of the Flushing Meadows project in Phoenix, Arizona, were investigated. The filtration of the secondary effluent through the gravel and sand resulted in almost complete removal of SS, BOD, and fecal coliforms, but total organic carbon was still present in concentrations of about five mg/liter. No fecal coliforms were encountered after 300 feet of horizontal travel. Total nitrogen load at the design hydraulic loading rate of 300 feet per year was 24,000 pounds per acre. Cyclic flooding and drying periods of several days each yielded essentially complete conversion of the nitrogen in the effluent to nitrate in the renovated water, but no removal of nitrogen. With flooding and drying periods of two weeks each, ammonium was adsorbed in the soil during flooding and nitrified; it was partially denitrified during drying. This yielded a net nitrogen removal of about 30 percent, which could be doubled or almost tripled by addition of organic carbon, recycling part of the renovated water, or by reducing the hydraulic loading rate. Phosphate removal was about 50 percent after 30 feet of underground travel, as was fluoride. Copper and zinc concentrations were reduced by about 80 percent. Dissolved salts content of the renovated water was about two percent higher than that of the effluent. The pH was lowered from 8 to 7. It was concluded that high-quality renovated water suitable for unrestricted irrigation and recreation can be obtained. Cost was about $5.3/acre-foot which is significantly less than the cost of equivalent in-plant tertiary treatment required to produce a water of similar quality. (See also W74-12004) (Murphy-FIRL)

A STUDY OF SELECTED COOLING POND DESIGN TECHNIQUES,
South Carolina Univ., Columbia. Coll. of Engineering.
J. H. Gibbons, and F. P. Pike.
Available from NTIS, Springfield, Va. 22161 as SRO-701-1, Price $5.45 printed copy; $2.25 microfiche. Contract Report SRO-701-1, June 1973. 74 p, 5 fig, 65 ref. AEC Contract AT(38-1)-701.

Descriptors: *Water pollution control, *Cooling water, *Hydraulic design, *Thermal pollution, Model studies, Reviews, Design, *Waste water treatment.
Identifiers: *Cooling reservoirs.

The available literature on cooling ponds was reviewed; the importance of the mixing problem is stressed. Seven visits were made to six electric utilities in the Southeast, exploring their information needs in regard to cooling reservoirs and their thermal rejection problems in general. In addition, visits were made to the Edison Electric Institute and to two consulting firms. Only a very few utilities engage in any intensive design of cooling ponds. It is clear that no generally accepted design procedures for cooling ponds are yet available. The key problem is the degree of mixing, which can be measured only with great difficulty. If the lake is completely mixed, or the flow through it is plug flow, design procedures are available. These two solutions bracket the case of the real reservoir, which is partially mixed. It is possible with a heat-conduction model to successfully model existing reservoirs for which sufficient data are available. The best answer is provided by hydraulic modeling. (Knapp-USGS)

ZONAL CENTRIFUGATION: APPLIED ASPECTS IN ELUCIDATING CHEMICAL AND BIOLOGICAL FORMS, DISTRIBUTION AND AVAILABILITY OF HEAVY METALS IN THE ENVIRONMENT,
Oak Ridge National Lab., Tenn.
J. N. Brantley, J. P. Breillatt, F. S. Brinkley, C. W. Francis, and B. A. Halsall.
In: ORNL-NSF-EATC-6, p 195-221, January 1974. 7 fig, 5 tab, 6 ref.

Descriptors: *Soil contamination, *Pollutant abatement, *Soil treatment, *Radioactivity, *Toxins, *Centrifugation, Analytical techniques, Instrumentation, Research and development, Laboratories, Absorption, Waste treatment.
Identifiers: *Zonal centrifugation.

One of the major objectives was to develop a large-scale zonal rotor capable of isopycnically banding soil and sediment particles in a nonaqueous density gradient. Zonal centrifugation has been shown to be a unique analytical tool for separating and identifying specific soil reaction products. Previous zonal work with soils and sediments was limited to swinging bucket rotors in which only 250 mg of sample could be banded in each bucket. Development of the large-scale zonal rotor will enable isopynic banding of 7 to 10 g of soil or sediment in one operation. Resolution in banding with the large-scale zonal rotor should also be enhanced. The increased capacity of the zonal rotor will allow more detailed characterization of each density band as well as providing sufficient material to evaluate the biological availability of a specific reaction product or adsorbed pollutant. RECOVERY OF TOXIC METALS FROM INDUSTRIAL EFFLUENT SOLUTIONS BY SOLVENT EXTRACTION,
Oak Ridge National Lab., Tenn.
F. L. Moore, W. S. Groenier, and W. E. Bayless.
In: ORNL-NSF-EATC-6, p 333-359, January 1974. 7 fig, 4 tab, 8 ref.

Descriptors: *Effluents, *Industrial wastes, *Abatement, Water pollution control, Toxicity, *Solvent extractions, Research and development, Zinc, Mercury, Cadmium, Pilot plants, Industrial plants, Brines, *Waste water treatment.
Identifiers: *Waste recovery.

Studies have continued on the applicability of the solvent extraction technique for pollution abatement of toxic metals in industrial effluents. Recent work on the extraction of inorganic mercury and organomercury compounds with quaternary amines is described, and studies of the extraction behavior of zinc and cadmium from aqueous cyanide solutions are discussed. Selected quaternary amines dissolved in diethylbenzene are considerably more effective than the pure diethylbenzene for the extraction of methylmercuric chloride and phenylmercuric acetate. The quaternary amines are the only extractants suitable for removing zinc and cadmium from cyanide solutions. A bench-scale mini-plant was designed and fabricated for operation with solvent extraction flowsheets for toxic metals removal. (See also W74-12021) (Houser-ORNL)

ELECTROCHEMICAL RECOVERY OF REDUCIBLE INORGANIC POLLUTANTS FROM AQUEOUS STREAMS,
Oak Ridge National Lab., Tenn.
F. A. Posey, and A. A. Palko.
In: ORNL-NSF-EATC-6, p 360-389, January 1974. 11 fig, 10 ref.

Descriptors: *Abatement, Water pollution control, Streams, *Inorganic compounds, Toxicity, *Metals, Lead, Copper, Cadmium, Electrodes, *Electrochemistry, Hydrogen ion concentration, Temperature, Industrial wastes, Effluents, Research and development, Laboratories, *Waste water treatment.

Results of continuing studies on the use of porous and packed-bed electrodes for electrolytic recovery of dissolved heavy metals from flowing streams are presented. Effects of solution composition, temperature, pH, and other factors on the rate of reduction of lead, copper, cadmium, and some other metals on a carbon substrate are discussed. Lead, copper, and cadmium could be reduced over a useful range of electrode potentials from all the solutions examined, so that efficient removal of these substances on porous and packed-bed electrodes is feasible. Experiments on the feasibility of electrolytic treatment of two lead-containing industrial effluents are presented. One effluent, a dilute rinse water from a continuous lead-lead oxide strip plating operation, could not be treated efficiently because of limited solution conductivity. The other effluent, from the manufacture of organolead compounds, was successfully treated electrolytically to remove dissolved inorganic and organic lead compounds from an organolead plant effluent under laboratory conditions. Progress in the development of prototype cells for lead recovery is discussed. (See also W74-12021) (Houser-ORNL)
W74-12034

EFFECTS OF RADIOACTIVE STRONTIUM ON MICROFLORA OF WATER AND ON MINERALIZATION PROCESSES OF ORGANIC SUBSTANCES,
V. M. Zhogova.
In: AEC-tr-7512, p 368-374, April 1974. 2 fig, 1 bibliography.

Descriptors: *Strontium, *Waste water treatment, *Water pollution treatment, *Aquatic environment, Environmental effects, Treatment facilities, Microbiology, Silts, Reservoirs, Sewage disposal, Degradation, Biodegradation, Biological treatment.
Identifiers: *Microflora.

Sanitary agencies and designing organizations are faced with problems related to treatment and decontamination of sewage water containing radioactive substances. One would expect that radioactive substances present in sewage water and accumulated in active silt will have a deleterious effect on the microfloral of biological treatment plants (biofilters, air tanks) thus lowering the efficiency of their operation. After reaching open reservoirs with liquid sewage, radioactive substances could have an adverse effect on survival of aquatic microflora and the mineralizing activity of water with reference to organic substances, thus deteriorating the sanitary condition of reservoirs. Radioactive strontium is among the most hazardous elements in this respect, since it can be incorporated in biological cycle and can accumulate in some animal tissues and biosubstances. W74-12041

STORAGE OF PLUTONIUM METAL IN SEALED CANS,
Dow Chemical Co., Golden, Colo. Rocky Flats Div.
L. E. Musgrave.
Available from NTIS, Springfield, Va 22161 as Rept No RFP-2143; $4/copy, $2.25/microfiche. Report No RFP-2143, March 15, 1974. 16 p, 15 fig, 5 tab, 8 ref.

Descriptors: *Radioactive waste disposal, *Plutonium, *Waste storage, *Safety, Stability, *Corrosion, Oxidation, Water, Moisture, Humidity, Chemical reaction, Fire, Research and development, Metallurgy, Materials engineering.
Identifiers: *Fire hazards.

Experiments have been conducted to assess the corrosion and fire hazards of plutonium metal stored in sealed produce cans. The amount of corrosion observed was about 10 times less than that expected in freely flowing air of 20 to 30% relative humidity. The reduction in corrosion is due to the reduced amount of oxidizer present in the sealed can; however, oxygen in air is not the chief oxidizer. Experiments with cans sealed in air and those sealed in low-oxygen atmospheres showed little difference in the amount of corrosion that later occurred. This suggests the main oxidizer is water vapor adsorbed inside the can. Experiments showed, however, that up to 40 g of molecular sieve was not effective in reducing the corrosion. Ignition experiments with corrosion products from unalloyed plutonium buttons showed that material to be combustible. In fact, when piled to sufficient depth on the button (about 1/8 in.), the corrosion product can burn when ignited by scratching the button. (Houser-ORNL)

DOMESTIC WASH-WATER RECLAMATION USING AN AEROSPACE-DEVELOPED WATER RECOVERY SUBSYSTEM,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
J. B. Hall, Jr.
Available from NTIS, Springfield, Va 22161 as N73-31913, Price $3.00 printed copy; $2.25 microfiche. Technical Memorandum X-2896, September 1973. 24 p, 3 fig, 5 tab, 7 ref, 2 append.

Descriptors: *Water reuse, *Reclaimed water, *Distillation, *Waste water treatment, Water purification, Potable water.

A prototype distillation system for water recovery designed for aerospace use, was tested to determine its capability to recover potable water from domestic wash water. A total of 26.25 gallons of domestic wash water was processed over a 7-day period at an average process rate of 3.85 gallons per day. The subsystem produced water that met all United States Public Health Standards for drinking water. Average energy consumption was approximately 12.74 kilowatt-hours per gallon of water recovered. This condition represents a worst-case energy consumption since no attempt was made to recover heat energy in the subsystem. An ultraviolet radiation cell installed in the effluent line of the subsystem was effective in controlling coliforms within acceptable levels of drinking water. The subsystem recovered virtually 100% of the available water in the waste-water process. In addition, the subsystem removed 99.6% nd 98.3% of the surfactants and phosphate, respectively, from the wash water. (Knapp-USGS)
W74-12073

COAST GUARD 20 MAN SHIPBOARD WASTE-WATER TREATMENT SYSTEM--PHASE 1, FINAL REPORT,
Thiokol Chemical Corp., Brigham City, Utah. Wasatch Div.
T. J. O'Grady.
Available from NTIS, Springfield, Va 22161 as AD-764 558 Price $4.25 printed copy; $2.25 microfiche. Document No TWR-6231, Contract Report for Coast Guard Office of Research and Development, July 1972. 98 p, 32 fig, 15 tab. Coast Guard DOT-CG-12, 843-A.

Descriptors: *Waste treatment, *Waste water treatment, *Ships, *Sewage treatment, Water pollution control, Incineration, Waste disposal.

A shipboard waste treatment system for a crew of 10-20 was studied. A preliminary design for the prototype system is presented. The results of the laboratory model testing are analyzed and the alternative approaches compared for filter-incinerator and secondary treatment systems. The catalyzed electrolytic process provides rapid oxidation of dissolved organic material in the waste, producing an effluent low in BOD and suspended solids. (Knapp-USGS)

THE COMPUTER SIMULATION OF THE OPERATION OF A BANK OF RAPID GRAVITY FILTERS,
Water Research Association, Marlow (England).
D. W. Hilder.

In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 79-84, 25-27 September 1973. 5 fig, 2 ref.

Descriptors: *Computer programs, *Simulation analysis, Control, *Weirs, *Water quality control, *Waste water treatment, *Filters, Gravity, Water quantity, Effluents, Water delivery, Operations research, Valves, Systems analysis.
Identifiers: Filter plants, Influents, Backwashing.

A computer simulation program has been developed from a suitable mathematical model to represent the operation of a bank of rapid gravity filters. The mathematical model accounts for the flows into the filters, the transient storage in the filters, the relationships between the heads and flows through the filters, and the effects due to backwashing. Different methods of filter control and operation can be simulated. This paper deals with the application of the simulation to a bank of sixteen filters and investigates two methods of operation: (1) as fixed rate achieved by influent weir control; and (2) as a variable declining rate system. An idealized system is considered. Simulation results are discussed. It is concluded that the two systems are identical, except for the methods in which water is delivered to the bank of filters. Moreover, water balance calculations show that the amount of water delivered by the system is the same in both cases, and the simulation assumes that the influent water quality is the same. EFFECT OF TEMPERATURE AND OXYGEN PRESSURE ON CELLULOSE UTILIZATION BY THERMOPHILIC ORGANISMS,
Rhode Island Univ., Kingston. Dept. of Chemical Engineering, and Rhode Island Univ., Kingston. Dept. of Microbiology.
S. M. Barnett, R. A. Romanelli, and C. W. Houston.
Available from the National Technical Information Service as PB-235 839 $4.50 in paper copy, $2.25 in microfiche. Completion Report, July 1974. 101p, 19 fig, 12 tab, 151 ref. OWRT A-046-RI(1), 14-31-001-3840.

Descriptors: Thermosphilic animals, *Fungi, *Cellulose, Dissolved oxygen, *Fermentation, Temperature, Pressure, *Waste water treatment, *Growth rate.
Identifiers: Thermophilic organisms, *Thermophilic fungi, *Chaetomium thermophil, *Sporotrichum thermophile, *Thermoascus aurantiacus.

Three thermophilic celluloytic fungi, Chaetomium thermophile var. coprophile, Sporotrichum thermophile and Thermoascus aurantiacus were studied to determine the conditions for a high rate of cellulose degradation. The range of temperature over which good growth occurred was determined first in a temperature gradient incubator, the optimum temperature was then established in shake flask cultures. T. aurantiacus had the highest optimum growth temperature range (46-51C), whereas S. thermophile had the broadest range over which good growth occurred (36-43C). Optimum temperatures for the three organisms, T. aurantiacus , S. thermophile and C. thermophile were 48, 40 and 40C respectively. The effect of pressure on cellulose utilization, cell yield, growth rate and optimum growth temperature of the cellulolytic fungi Chaetomium thermophile var coprophile, Sporotrichum thermophile and Thermoascus aurantiacus was studied in especially designed pressure vessels. The optimum and limiting growth pressures of these fungi were also determined. The effect of pressure per se on the degree of polymerization was studied in uninoculated medium. Pressure above 75 psig was inhibitory to C. thermophile, while pressure above 90 psig was inhibitory to S. thermophile and T. aurantiacus. The growth and utilization of cellulose by S. thermophile and T. aurantiacus, however, increased under pressure and displayed a maximum between 30 and 45 psig. Pressure applied under growth conditions had no effect on cellulose depolymerization of cellulose of the three fungi; the optimum growth pressure was 40 psig.

AN ELECTROCHEMICAL METHOD FOR REMOVAL OF PHOSPHATES FROM WASTE WATERS,
Dynatech Corp., Cambridge, Mass.
S. E. Sadek.
Water Pollution Control Research Series, (1970). 47 p, 23 fig, 8 tab, 10 ref. FWQA Program No. 17010--02/70, 14-12-405.

Descriptors: Phosphates, *Electrochemistry, *Waste water treatment, *Electrodes, Costs, *Electrolysis, Flotation, Sewage treatment, Ion exchange, Ion transport.
Identifiers: Treatment costs, *Phosphates removal.

Phosphates in waste water may be removed electrochemically utilizing sacrificial electrodes. The electrode metal is first dissolved by the flow of current then precipitates out, removing from solution the phosphate ions. This removal is either dependent on chemical reaction of the metal cation and the phosphate anions or, possibly, on the adsorption of the phosphate by the metal hydroxide floc. Data on the phosphate removal was gathered using both aluminum and iron electrodes. Essentially complete removal was found to occur on using 300 coulombs/liter of charge flow with normal phosphate concentrations for both types of electrodes. Aluminum consumption averaged about 0.7 mass units per single mass unit of PO4 removed for essentially complete phosphate removal. This mass ratio was about 2 for iron electrodes. Treatment costs (excluding labor and filtration) have been estimated to be about 2.5 cents/1000 gal. and 8 cents/1000 gal. when using iron and aluminum electrodes respectively. Exploratory tests indicated that flotation by means of the hydrogen generated during the electrolysis may be used to remove suspended solids from raw sewage while phosphates are being removed.

EVALUATION OF POLYMERIC CLARIFICATION OF MEAT-PACKING AND DOMESTIC WASTEWATERS,
Metropolitan Sewer Board, St. Paul, Minn.
K. D. Larson, and D. A. Maulwurf.
Available from GPO Sup Doc as EP1.23:660/2-74-020, $2.30; microfiche from NTIS, Springfield, Va 22161 as PB-235 900, MF$2.25. Environmental Protection Agency, Technology Series EPA-660/2-74-020, April 1974. 197 p, 13 fig, 60 tab, 2 ref, 3 append. EPA Project 12130 EKK, Program Element 1BB037.

Descriptors: *Waste water treatment, Settling basins, *Polyelectrolytes, *Flocculation, Biochemical oxygen demand, Suspended solids.
Identifiers: *Polyelectrolyte treatment, Packinghouse waste water, *Polymeric clarification, Chemical treatment, Ferric chloride treatment.

Laboratory tests were conducted to determine which system of chemicals would be most effective on combined packinghouse and domestic waste. A dual system of chemicals was found which was effective in the treatment of this combined waste. This was a combination of ferric chloride and an anionic polyelectrolyte. This system was effective in forming a floc which would settle out under the dynamic conditions of the overloaded primary sedimentation tank. Treatment with this system could effectively reduce suspended solids in the effluent of the primary sedimentation tank over what could be achieved without the use of this dual system. This was demonstrated by running: (1) a parallel system of identical test and control tanks and, (2) full plant scale investigation for both test and control periods, kept as identical as possible. When full plant scale tests were run, laboratory data were collected from various sampling points throughout the plant during the test and control periods. A significant reduction of BOD and suspended solids was obtained in the primary sedimentation tanks and a change in efficiency was not observed on the trickling filters resulting in an overall reduction in these parameters in the effluent from the secondary sedimentation tank. The cost of chemically treating the combined 10 mgd of wastewater would be approximately $45 per million gallons and would be less for strictly domestic wastes. (EPA)

Copy Available from GPO Sup Doc as EP1.23:660/2-74-037, $2.90; microfiche from NTIS. Springfield, Va 22161 as PB-235 886, $2.25. Environmental Protection Agency Technology Series Report EPA-660/2-74-037, May 1974. 275 p, 28 fig, 16 tab, 68 ref, 5 append. EPA Project 14020 FVW, 14-12-873.

Descriptors: *Oil industry, *Brine disposal, *Cost analyses, Permits, Evaporation, Injection wells, Cost comparisons, *Waste water disposal, Waste disposal, *Waste treatment, *Alternative costs, State governments.
Identifiers: Brine disposal costs, State-permitted brine disposal mechanisms.

Methodology is developed for the economic evaluation of environmentally acceptable brine disposal systems. Specifically, a procedure is presented for determining total unit costs of alternative systems. These are then compared in order to select the least expensive, legally-permitted disposal processes. A broad and simplified discussion of resources economics is included. Disposal mechanisms and disposal cost analyses are described. Methods are included for obtaining the necessary information for use in the analyses. A

listing is made of state regulatory agencies and their roles in administering brine disposal policies. (Pfeffer-EPA)

SOIL MODIFICATION FOR DENTRIFICATION AND PHOSPHATE REDUCTION OF FEEDLOT WASTE,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
A. E. Erickson, B. G. Ellis, J. M. Tiedje, C. M. Hansen, and F. R. Peabody.
Copy Available from GPO Sup Doc as EP1.23:660/2-74-057, $1.60; microfiche from NTIS, Springfield, Va 22161 as PB-235 909, $2.25. Environmental Protection Agency, Technology Series Report EPA-660/2-74-057, June 1974, 118 p, 9 fig, 24 tab, 10 ref. EPA Project 13040 FYK, Program Element 1BB039.

Descriptors: Hogs, Dairy industry, *Denitrification, *Aerobic treatment, Anaerobic conditions, *Soil treatment, Waste treatment, *Farm wastes, *Phosphates, Feed lots, Biodegradation, Pilot plants, *Waste water treatment.
Identifiers: Barriered landscape water renovation systems, Organic matter decomposition, Phosphate fixation.

The efficiency of pilot-size Barriered Landscape Water Renovation Systems (BLWRS) to renovate flushed livestock waste was studied. The BLWRS is a modified permeable soil that has an aerobic zone for the filtering and oxidation of the waste and an anaerobic zone to which an energy source is added to create an environment for denitrification. Two pairs of BLWRS 0.008 ha. in size were constructed using a polyvinyl barrier to create the anaerobic zone and contain the effluent. Flush waste from swine or dairy cattle were applied on each pair of BLWRS. The waste effluents and BLWRS soil were periodically analyzed for nutrients, oxygen demand and pathogens. At manure loading rates of up to 122 t/ha. swine waste and 93 t/ha. of dairy waste, the BLWRS had an efficiency of 80% and 97% for nitrogen renovation, greater than 99% for phosphate and 93% for carbon. The oxygen demand dropped 50- to 100- fold. Under normal operating conditions, the pathogenic indicator organisms did not appear in the effluent. The BLWRS has been shown to be an efficient system for renovating large quantities of livestock waste and should be tested on a commercial scale with continuous monitoring. (EPA)

LIQUID AEROBIC COMPOSTING OF CATTLE WASTES AND EVALUATION OF BY-PRODUCTS,
Chino Basin Municipal Water District, Cucamonga, Calif.
F. Grant, and F. Brommenschenkel, Jr.
Copy available from GPO Sup Doc as EP1.23:660/2-74-634, $0.95; microfiche from NTIS as PB-235 914. Environmental Protection Agency Technology Series Report EPA-660/2-74-034, May 1974, 50 p, 2 fig, 16 tab, 36 ref, append. EPA Project S801647 (13040 HPV), Program Element 1BB039.

Descriptors: *Farm wastes, *Aerobic treatment, *Byproducts, Economic feasibility, Biological oxygen demand, Chemical oxygen demand, Dissolved solids, *Waste treatment, Feasibility studies, Costs, Dairy industry.
Identifiers: Volatile solids, Thermophilic reactors, Mesophilic reactors, Total dissolved solids, *Liquid composting.

The technical and economic feasibility was determined of treating dairy waste in a liquid state by a tandem thermophilic-mesophilic aerobic stabilization process, more commonly described as liquid composting. Experimental apparatus were set up at an operating dairy. A large fraction of dairy manure is relatively resistant to rapid biological degradation even at thermophilic temperatures. Antithertical requirements of sufficient oxygen for maximum biological activity and minimum air flow to preclude the need for an external heat source could not be satisfied with the particular experimental apparatus when utilizing air as the oxygen source. Improved results were obtained with an oxygen-enriched air supply which pointed out the potential advantage of a pure oxygen system. Preliminary cost estimates for a liquid composting process to serve 500 cows were developed within the context of current dairy operation economics. The process is considerably more costly than current, conventional, composting, operations. The cost of the process is substantially above levels which could be maintained by dairy operations. (EPA)

NITROGEN REMOVAL AND PHOSPHORUS PRECIPITATION IN A COMPARTMENTALIZED AERATION TANK,
New York State Dept. of Environmental Conservation, Albany.
C. Beer, and L. J. Hetling.
February 1974. 23 p, 25 fig, 13 ref. EPA, 17050 EDL.

Descriptors: *Waste water treatment, *Sewage treatment, *Activated sludge, *Pilot plant, *Denitrification, *Aeration, Municipal wastes, Treatment facilities, Treatment, Aerobic treatment, Water pollution control, Biological treatment, Flow control, New York.
Identifiers: *Nitrogen removal, *Phosphorus precipitation, Compartmentalized aeration tank, Flow equalization, Ferric chloride, Anoxic cell.

With a view to the importance of the activated sludge process in the New York State water pollution program, the State of New York embarked in 1968 on a research and development program in the area of activated sludge. It was hoped that results of that program might help to operate existing activated sludge plants more efficiently and, perhaps, to develop modifications that could be incorporated in these plants for achieving greater removals of contaminants. It was also hoped that processes could be developed that would influence the design of plants not yet on the drawing board. As a vehicle for the research and development program drawn up, it was decided to construct an experimental sewage treatment plant that would serve one of the state's institutions, the Coxsackie Correctional Facility. A modification of the biological nitrogen removal process described by Wuhrman (W70-04764) was combined with the phosphorus removal process based on the addition of ferric chloride to the aeration tank of the activated sludge system as described by Thomas and Wildi (W73-07465). Good results were obtained in treating approximately 95,000 gallons per day of institutional sewage. A compartmentalized aeration tank (11 compartments) was used, with arrangement for aerobic treatment after denitrification and before final settling. The required ferric chloride addition for phosphorus elimination was much less than the stoichiometric requirement. (Poertner)

THE ELECTRICAL PROCESS IN THE BREAKING OF DILUTE OIL-IN-WATER EMULSIONS,
Georgia Inst. of Tech., Atlanta. High Temperature Materials Div.
C. Orr, Jr., and E. Y. H. Keng.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 908, $3.00 in paper copy, $2.25 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No. ERC-0674, June 1974. 15 p, 2 fig, 2 tab, 4 ref. OWRT A-049-GA(1). 14-31-0001-4010.

Descriptors: Water pollution control, *Zeta potential, Electrical properties, *Emulsions, *Oil-water interfaces, *Oil wastes, *Industrial wastes, Oily water, Separation techniques, Waste water treatment.
Identifiers: Oil-water emulsions, Grease, Wax.

Oils, greases, and waxes frequently occur in industrial waste waters as highly dispersed droplets. Simultaneously, soaps and detergents enter most waste waters from domestic and other sources. When the mixtures of waste particles in water, known as emulsions, come in contact with the soaps and detergents, they generally become quite stable. One way to break such emulsions and thereby separate out the wastes is to add chemicals that will cause the oil droplets to agglomerate into larger drops. The problem is to determine just which chemical and what quantity of that chemical is needed to induce a given emulsion to agglomerate (break). This study sought to assess the usefulness of electrical measurements, particularly the so-called zeta potential, in guiding the treatment process to chemicals and application rates that can break measured emulsions. When the zeta potential, which for a highly stable emulsion may be as negative as -0.090 volt, is made to approach -0.015 volt, the stability of the emulsion deteriorates rapidly. Past this point, oil-in-water emulsions often break spontaneously. The larger drops will than rise to the water surface and form a distinct oil layer that can be easily removed. Laboratory applications of various chemicals to emulsion samples and subsequent zeta potential measurement should thus provide a ready guide to those trying to remove oily waste water discharges. (James-Georgia Tech)
W74-12343

TREATMENT OF WASTE WATER FROM FISH AND SHELLFISH PROCESSING PLANTS,
Rhode Island Univ., Kingston. Dept. of Chemical Engineering.
H. N. Knickle.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 925, $3.25 in paper copy, $2.25 in microfiche. Completion Report, July 31, 1974. 35 p, 3 fig, 9 tab, 6 ref. OWRT A-048-RI(1). 14-31-0001-3840.

Descriptors: *Waste water treatment, Water pollution, *Filtration, Reverse osmosis, Adsorption, *Chemical precipitation, Economics, *Food processing industry, *Industrial wastes, Effluents.
Identifiers: Fish processing wastes, Shellfish processing wastes.

Some of the simpler methods for treating liquid effluent from fish and shellfish processing plants have been studied with particular emphasis on their effectiveness and economy. These include filtration, reverse osmosis, adsorption, and chemical precipitation. In addition, the wastewater from an operating shellfish plant has been characterized. Filtration and chemical precipitation both appear to be effective and economical treatment methods.

A TOTAL PROCESS APPROACH TO WATER AND WASTE MANAGEMENT IN AN EXPANDING FINE PAPER MILL,
Papeteries de Virginal (Belgium).
G. W. Ruth, and J. Catterall.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 143-159, 1973. 3 fig, 1 tab, 8 ref.

Descriptors: *Pulp wastes, *Solid wastes, *Sludge, Treatment facilities, Waste treatment, *Waste water treatment, *Water purification, Water supply, Pulp and paper industry, Europe, Ion exchange, Filtration, Flocculation, Mixing, Flotation, Aeration, Landfills, Lime, Sumps, Pumps, Effluents, Polyelectrolytes, Boiler feed water, Industrial water, Water conservation, Recirculated water.
Identifiers: *Belgium, White water(Paper machine), Charleroi Canal(Belgium), Sennette River(Belgium).

A Belgian fine-paper and coated-paper mill (owned jointly by a U.S. and a British company) manufactures lightweight papers, especially optical character recognition (OCR) papers. It generates only enough steam for drying and space heating and no electric power. Boiler feed water from the Sennette River is pretreated with lime and by ion-exchange. Additional water supply comes from the Charleroi canal since the mill expanded from 75-110 to 200-250 daily tons by replacement of one of the two older machines with a high-speed paper and coating machine. Machine white water flows through mesh screens into two separate sumps equipped with submerged centrifugal pumps which deliver the effluent to the mixing chamber of an 85-ft clarifier where sulfuric acid and lime may be added. The center of the clarifier is equipped with a rake, raise-lower facilities, skirt, and flocculating turbines. The clarified effluent (with or without alum and polyelectrolyte addition) passes to an aeration basin having a 6-hp floating aerator and then is either discharged to the river or to a second chamber from which it can be recycled to the raw water sumps or discharged to the canal. Sludge from the clarifier is pumped to a thickener and to a vacuum drum filter and is disposed of by hauling to a landfill site. (See also W74-12400) (Brown-IPC)

In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, p 161-170, 1973. 8 fig.

Descriptors: *Pulp wastes, *Bleaching wastes, *Water pollution control, *Pollution abatement, *Waste water treatment, Waste treatment, Air pollution, Europe, Pulp and paper industry, Water conservation, Recirculated water, Water pollution sources, Sulfite liquors.
Identifiers: Kraft mills, Sulfite pulp mills, *Sweden, Condensates, Evaporator condensates, Barking(Debarking), Closed systems.

Since the Swedish pulp and paper industry is responsible for over half of the total organic matter discharged into streams, as well as for considerable emissions of atmospheric sulfur dioxide, a three-year study project was conducted during 1970-1973 with the aid of about 100 scientific experts and a $6 million budget to focus on technologically feasible pollution control measures. Several changes in the operating procedures and practices of mills are recommended, which should considerably reduce the pollution load from both kraft and sulfite mills. These changes are discussed and include, e.g., conversion from wet to dry debarking of pulpwood, stripping and reuse of evaporator condensates, and closure of the pulp cooking, washing, screening, and drying cycle. TREATMENT OF CONDENSATE,
Angpanneforeningen, Stockholm (Sweden).
O. Axelsson, and S. E. Jonsson.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 201-227, 1973. 15 fig, 10 tab, 8 ref.

Descriptors: Treatment facilities, *Pulp wastes, Condensation, Byproducts, Pollution abatement, *Waste water treatment, Waste treatment, Liquid wastes, Odor, Biochemical oxygen demand, Sulfite liquors, Alcohols, Costs, Operating costs, Water pollution control, Recycling, Recirculated water, Water reuse, Neutralization, Steam, Water vapor, Gases, Water pollution sources, Pulp and paper industry, Biological treatment.
Identifiers: Kraft mills, *Sulfite pulp mills, *Condensates, *Evaporator condensates, *Digester condensates, Digesters(Pulp mill), Evaporators, Furfural, Methanol(Methyl alcohol), Formic acid, Acetic acid, Spent pulping liquors.

Steam and vapor condensates from kraft and sulfite pulp mill digesters and evaporators are discussed with regard to reduction of BOD and odor emissions by various technological measures, notably neutralization of spent pulping liquors, recovery of by-products (such as methanol, furfural, and formic and acetic acids) from the condensates, biological effluent treatment, improved extraction of spent liquors, and recirculation of condensates to the acid-making (cooking liquor preparation) stage. The comparative costs of various treatment processes are also indicated. (See also W74-12400) (Brown-IPC)
W74-12409

SOME SYSTEMS DEVELOPED FOR POLLUTION ABATEMENT IN THE PULP INDUSTRY, PARTICULARLY OXYGEN BLEACHING,
Mo Och Domsjo A.B., Ornskoldsvik (Sweden).
I. Croon.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 229-253, 1973. 24 fig.

Descriptors: *Water pollution control, *Pulp wastes, Pulp and paper industry, *Pollution abatement, Air pollution, *Bleaching wastes, Economics, *Costs, Oxygen, Oxidation, Effluents, Sulfur compounds, Odor, Europe, Canada, Water conservation, Industrial wastes, Waste treatment, Biochemical oxygen demand, Color, Toxicity.
Identifiers: *Kraft mills, Sweden, Debarking(Barking), *Oxygen bleaching, Pulp washing, Condensates, Gas scrubbing, Closed systems.

Recent developments in oxygen bleaching of pulp promise to reduce not only the BOD, toxicity, and color of bleach plant effluents but also the total volume of aqueous discharges from pulp and paper mills. Further aids to the reduction of water pollution include dry debarking of pulpwood logs, closed-circuit screening and countercurrent washing of pulp, and treatment of condensates from digesters and evaporators. By converting to oxygen bleaching sequences in conjunction with steam stripping of condensates, a kraft pulp mill may eliminate 65% of its effluent BOD and 70% of the color load while saving at least $5 per ton of pulp in chemical costs, without affecting the quality of the pulp produced. Odiferous sulfur emissions from various sites in the mill can be collected, scrubbed, and/or subjected to thermal oxidation. Black liquor (spent alkaline pulping liquor) can be oxidized to minimize reduced sulfur compounds (such as mercaptans and hydrogen sulfide) in flue gases from direct-contact evaporators. The main sources of sulfur dioxide emissions is the recovery furnace stack. They can be minimized by scrubbing flue gases with alkaline solutions. The MoDo scrubber combines this process with heat recovery. Progress along these lines Mo och Domsjo AB. in Sweden and by Chemetics Ltd. in Canada is emphasized. (See also W74-12400) (Brown-IPC)
W74-12410

PULP MILL WATER SYSTEM CLOSURE,
Swedish Forest Products Research Lab., Stockholm.
N. Hartler.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 267-281, 1973. 15 fig.

Descriptors: *Water reuse, *Water conservation, *Industrial water, *Recirculated water, *Water pollution control, *Pollution abatement, *Pulp and paper industry, Pulp wastes, Effluents, Waste treatment, Waste water treatment, Operation and maintenance, Bleaching wastes.
Identifiers: Closed systems, Pulp mills, Unbleached pulps, Bleached pulps.

The closure of pulp mill water circuits is attractive for several reasons, including pollution abatement, freshwater conservation, and reduced fiber losses. Key points in closed production lines and some of the attendant problems are discussed, viz., (1) screening as an integral part of pulp washing; (2) cleaning and/or recycling of condensates; (3) system closure within and between filter washing stages; (4) cooking of pulpwood to higher delignification degrees; (5) replacement of Cl by chlorine dioxide; (6) separation of free chloride from organic substances; (7) secondary effluent treatment; and (8) leakage and accidental disturbances. System closure is approaching practical fulfillment for unbleached but not yet for bleached pulp manufacturing lines on which further research is needed. (See also W74-12400) (Brown-IPC)
W74-12411

ESTABLISHMENT OF A CLOSED SYSTEM FOR THE PAPER MAKING PROCESS,
T. Franzen, C. Heinegard, S. Martin-Lof, C. Soremark, and D. Wahren.

In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 311-336, 1973. 14 fig, 2 tab.

Descriptors: *Pulp wastes, *Pollution abatement, *Water pollution control, *Recirculated water, *Water purification, *Waste water treatment, Pulp and paper industry, Recycling, Economics, Discharge(Water), Slime, Operation and maintenance, Equipment, Temperature, Water properties, Industrial water, Effluents.
Identifiers: Closed systems, Paper machines, White water(Paper-machine), Papermaking.

Internal system closure represents one alternative measure for pollution abatement in paper mills. Such measures have several advantages over external effluent treatment method, provided that care is taken to avoid impairment of operating conditions and/or of product quality. Experience gained in many paper mills with the full or partial closure of the white water circuit has shown that a substantial part of conventionally discharged pollutants can be excluded from effluents and reused in paper products without negative effects. In many instances, such system closures have improved not only the mill's operating conditions, such as paper machine drainage and minimized slime deposits, thanks to increased water temperatures, but also the optical and mechanical properties of the paper sheet. Moreover, savings in fiber consumption and heat supply amounting to $10 to $15 per ton of paper can be realized by various circuit-closing measures, such as recirculation of internally cleaned white water as shower, cooling, and sealing water. An appendix gives calculations of the materials balance and discusses the concentration relationships resulting from a white water system closure. (See also W74-12400) (Brown-IPC)
W74-12412

DESIGN PRINCIPLES OF WHITE WATER SYSTEMS WITH SPECIAL REFERENCE TO EFFLUENT CONTROL,
Jaakko Poyry and Co., Helsinki (Finland).
P. Aaltonen, M. Nyyssola, and S. Von Troil.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 337-349, 1973. 2 fig, 2 tab.

Descriptors: *Water conservation, *Industrial water, *Waste water(Pollution), *Recirculated water, *Pulp wastes, *Pulp and paper industry, Freshwater, Design, Equipment, Monitoring, Suspended solids, Colloids, Dissolved solids, Water pollution control, Pollution abatement, Design criteria.
Identifiers: Paper machines, Fourdrinier machines, Sheet formers(Paper-machine), Closed systems, White water(Paper-machine).

Basic principles for designing process water circuits for a fourdrinier paper machine are discussed, notably the controlled use of freshwater, observations of stock and water system dynamics, and monitoring of suspended, dissolved, and colloidal materials. The presence of more than one machine or modern nonfourdrinier sheet formers in a single mill may alter the system design. (See also W74-12400) (Brown-IPC)

FRACTIONAL INPLANT TREATMENT OF RECYCLE FLOWS BY ADVANCED TECHNIQUES,
Institute of Paper Chemistry, Appleton, Wis.
A. J. Wiley.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 351-362, 1973. 5 fig, 1 tab, 9 ref.

Descriptors: *Waste water treatment, *Pulp wastes, *Bleaching waters, *Recirculated water, *Water conservation, *Treatment facilities, *Reverse osmosis, Membrane processes, Adsorption, Activated carbon, Electrodialysis, Freeze drying, Filtration, Flotation, Pulp and paper industry, Industrial water, Water purification, Waste water(Pollution), Recycling.
Identifiers: Ultrafiltration, Savealls, Woodrooms(Pulp mill), Bleach plants(Pulp mill), Pulp washing, Paper machines, Papermaking, Pulp mills, Paper mills.

The papermaking process can be divided principally into five main unit operations, viz., the woodroom, the pulp mill, the pulp washing plant, the bleach plant, and the machine room, each comprising facilities for water processing, such as clarifiers, pulp presses, drum filters, washing presses or filters, and flotation savealls. The total system design principle, however, calls for recycling of waste waters from later to earlier stages after appropriate purification. Novel technological approaches under investigation include reverse osmosis, ultrafiltration, activated carbon adsorption, electrically drive membrane processes (such as electrodialysis), and freeze concentration. Work performed particularly on reverse osmosis at the Institute of Paper Chemistry is reported. (See also W74-12400) (Brown-IPC)
W74-12414

CLARIFICATION OF WHITE WATER BY VACUUM FILTRATION (KLAERUNG VON WEISSWASSER DURCH VAKUUM-FILTRATION),
R. F. Kozich.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 363-376, 1973. 13 fig.

Descriptors: *Water treatment, *Waste water treatment, *Filtration, *Pulp wastes, *Industrial water, Pulp and paper industry, Water purification, Waste treatment, Additives, Flotation, Slime, Foaming, Operation and maintenance, Recirculated water, Water conservation, Equipment, Design, Design criteria.
Identifiers: Paper machines, White water(Paper-machine), Paper additives, Closed systems.

Factors affecting the design of white water (paper machine) circuits are discussed, including water volume, retention of fillers and fines (fine fibers), beating degree, filter aids, mineral (ash) content, and paper grades. Advantages of vacuum filtration over other white water purification processes are outlined. They include ready adaptation to different paper machines and paper qualities; elimination or minimized use of flocculants or other chemical additives; lower foam (gas) content in the machine headbox than with flotation savealls; fewer organic flock and slime deposits; insensitivity to changes in water influx; stable operation with little supervision; reduced space requirements; and reuse of treated white water as shower spray water. (See also W74-12400) (Brown-IPC)
W74-12415

EFFECTS OF RAW MATERIALS AND CHEMICAL ADDITIVES ON MILL EFFLUENT LOSSES,
Research Association for the Paper and Board, Printing and Packaging Industries, Leatherhead (England).
W. G. Cobett, R. A. Granville, and R. D. Isabell.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 377-391, 1973. 1 fig, 6 tab, 7 ref.

Descriptors: *Pulp wastes, *Biochemical oxygen demand, *Water pollution control, *Pollution abatement, *Additives, *Chemicals, Pulp and paper industry, Effluents, Suspended solids, Dissolved solids, Waste water treatment, Waste treatment, Industrial wastes, Costs, Pollutants, Water conservation, Water reuse, Recirculated water.
Identifiers: Waste papers, Retention aids, Stock preparation(Pulp), Paper additives.

The most logical first step toward reduced water pollution at a pulp or paper mill is to maximize water recirculation and thus cut the freshwater intake. This will both simplify the task and lower the costs of removing suspended solids and BOD from effluents. For maximizing treatment cost savings, the reduction of water pollution achieved should be judged in terms of load (kg/day) rather than of concentration (mg/liter). The solubles in paper mill effluents derived from wood pulps are not greatly affected by variations in stock preparation and cannot be substantially reduced by common procedures. However, the appropriate choice of chemical additives, such as beater and surface sizing agents, may improve the retention of water solubles in the sheet and lessen the effluent BOD load. Despite this judicious selection, high pollution loads will still arise from contaminants in poorer grades of waste paper furnishes. The use of low-BOD additives, such as carboxymethylcellulose, may provide only temporary relief, since stricter demand by pollution control authorities may pose the later problem of removing these additives from the effluent. Details are reported of research studied conducted by PIRA on sources of BOD in different kinds of wood pulps (mechanical, sulfite, kraft, neutral semichemical sulfite, softwood, hardwood, etc.) and various furnish additives, such as rosin size, alum, oxidized starch, cationic starch, and the like. MECHANICAL TREATMENT OF PULP AND PAPER MILL EFFLUENT,
Nevalainen and Orivuori, Helsinki (Finland).
J. Koljonen.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 435-448, 1973. 1 fig, 3 tab.

Descriptors: *Treatment facilities, *Pulp wastes, *Waste treatment, *Waste water treatment, *Suspended solids, *Costs, *Economics, *Capital costs, *Operating costs, *Sludge treatment, Discharge(Water), Waste water(Pollution), Filtration, Centrifugation, Flotation, Effluents, Energy, Sludge disposal, Liquid wastes, Solid wastes, Industrial wastes, Pulp and paper industry, Europe, Water pollution sources, Water pollution control, Pollution abatement.
Identifiers: Kraft mills, Sulfite mills, Woodrooms, Barking(Debarking), Finland.

The screening and clarification of kraft and sulfite pulp mill barking room (woodroom) effluents by mechanical methods such as flotation, filtration, and centrifugation are discussed, including treatment and disposal of the resulting sludges. Investment and operating costs of mechanical processes depend on the quality and quantity of effluents, the allowable suspended solids content of the treated discharges, the space available for treatment facilities, and sludge handling problems. For large Finnish mills with maximum allowable discharges of 8 to 15 kg suspended solids per tone of product, the removal of 1 ton suspended solids per day requires a capital investment of ca. $120,000 and a total expense (with 6% interest over 20 years) of 0.5 cent per cu m of effluent treated, provided that no chemical flocculants are needed. The energy demand of mechanical treatment installations is about 20 kw per ton of suspended solids removed daily. (See also W74-12400) (Brown-IPC)
W74-12418

THE USE OF SILICATES AND POLYELECTROLYTES FOR FLOCCULATION,
Papiripari Vallalat Kutato- es Fejlesztointezete, Budapest (Hungary).
P. Lengyel, K. Engelhoffer, and J. Papp.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 491-503, 1973. 6 fig, 4 tab, 7 ref.

Descriptors: *Waste water treatment, Waste treatment, *Pulp wastes, Additives, *Suspended solids, *Chemical oxygen demand, *Silicates, Zeolites, Clays, Montmorillonite, *Polyelectrolytes, *Flocculation, Sedimentation, Chemical precipitation, Colloids, Aluminum, Ion exchange, Kaolinite, Bentonite, Kaolin minerals, Hydrogen ion concentration, Neutralization, Effluents, Sludge, Recycling, Water pollution control, Pollution abatement.
Identifiers: *Alum(Aluminum-potassium sulfate), Waste paper, Swelling, Swellability, Specific surface, Surface area.

The characteristics and purification of mill effluents are discussed with special reference to a paper mill in which large amounts of waste paper fibers are recycled. Laboratory studies are reported concerning the effects of alum, silicates, and polyelectrolytes on the COD and sediment solids content of paper-machine waste waters (white waters). Silicate additives (including sodium carbonate-activated bentonites, kaolins, and zeolites) were tested for montmorillonite content, ion-exchange capacity, swellability, and specific surface area in order to seek relationships between these characteristics and the effluent-purifying efficiency of the compounds. Also determined were those alum levels required to give a sediment-free effluent and beyond which no significant further COD reduction was evident. It was found that a part of the alum needed to remove colloidal and suspended solids could be replaced by certain silicates while keeping the pH of the clarified water neutral, so that no further pH adjustment was necessary prior to discharge or recirculation of effluent waters. A relationship was also found between the physical characteristics of silicates on one hand and the sedimentation rate of suspended solids and the sludge volume produced on the other hand. (See also W74-12400) (Brown-IPC)
W74-12420

THE BIOLOGICAL PURIFICATION OF PAPER INDUSTRY WASTE WATERS (DIE BIOLOGISCHE REINIGUNG VON RESTABWAESSERN DER PAPIERINDUSTRIE),
Cellulose Attisholz A.G., Luterbach (Switzerland).
A. Scherler.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 505-521, 1973. 4 fig, 12 tab.

Descriptors: *Biological treatment, *Pulp wastes, Treatment facilities, Waste treatment, *Waste water treatment, *Pollution abatement, Economics, *Operating costs, Costs, Sludge treatment, Biochemical oxygen demand, Oxidation, Biodegradation.
Identifiers: Attisholz process(Effluent treatment).

After a review of the four main types of available biological treatment processes (trickling filters, total oxidation, and single- and two-stage sludge), the design and operation of the two-stage Attisholz process are discussed in some detail. This treatment is said to operate most economically, i.e., at a total cost of ca. 15 Swiss francs per ton of product (including capital interest, sludge utilization, and preclarification) while reducing effluent five-day BOD to ca. 0.4-kg per ton of paper. (See also W74-12400) (Brown-IPC)

TERTIARY METHODS OF WASTE TREATMENT,
Balfour-Italia, Rome (Italy).
J. R. Simpson, G. A. Truesdale, and L. Baruchello.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment, held in Rome, May 7 to 11, 1973, p 523-533, 1973. 1 tab, 3 ref.

Descriptors: *Tertiary treatment, *Waste treatment, *Waste water treatment, *Pulp wastes, *Biochemical oxygen demand, *Suspended solids, *Capital costs, Costs, Treatment facilities, *Filters, *Filtration, Bacteria, Irrigation, Soil disposal fields, Lagoons, Biological treatment, Pulp and paper industry, Effluents.
Identifiers: Microstrainers, Immedium filter, Simater filter.

After full-scale biological treatment of effluents to at least 20 mg/liter of BOD and 30 mg/liter of total suspended solids (TSS), residual objectionable constituents may require further treatment. Such tertiary processing cannot be justified solely for improving the effluent quality of an inefficient secondary treatment system, since the capital costs for achieving ultimate BOD and TSS values of 10 and a final ammonia N content of 3.5 mg/liter are 25% higher than those for BOD reduction to 20 and TSS reduction to 30 mg/liter. Various tertiary polishing methods are compared, including irrigation over grasslands, lagooning, slow and rapid gravity sand filters, 'Immedium' upward-flow and 'Simater' radial-flow sand filters, microstrainers, gravel-bed clarifiers, and bacteria removal. (See also W74-12400)

ACTIVATED CARBON AND OTHER TECHNIQUES FOR COLOR REMOVAL FROM KRAFT MILL EFFLUENTS,
Saint Regis Paper Co., Pensacola, Fla.
W. G. Timpe, and E. W. Lang.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 535-557, 1973. 10 fig, 8 tab, 32 ref.

Descriptors: *Activated carbon, *Pulp wastes, *Waste water treatment, *Bleaching wastes, *Biological treatment, Color, Reverse osmosis, Ion exchange, Lime, Lignins, Membrane processes, Biochemical oxygen demand, Pulp and paper industry, United States, Water consumption(Except consumptive use), Suspended solids, Dissolved solids, Costs, Operating costs, Water reuse.
Identifiers: Alum(Aluminum-potassium sulfate), Kraft mills.

Of the 2100 billion gal of water consumed annually by the U.S. paper industry 1500 billion are used by the kraft industry. Manufacture of kraft paper requires 10,000 to 60,000 gal (average 27,000 gal) of water per ton. Effluent contaminant range from truly dissolved to suspended materials. Clarification and bio-oxidation processes can remove all suspended solids and 90% of the 5-day BOD in modern mills. Effluent color (light to dark brown, exceeding 500 APHA color units) represents about 50% of dissolved organics and is caused mainly by black liquor lignin (representing 2-7% losses from the system) and by lignin degradation products formed during pulp bleaching. In the U.S.A. five commercial lime treatment systems operated on kraft and mixed effluents for color removal, which ranges from 60 to 95% at a lime pH of 11.5 or above. Although alum can remove color at pH 5-6 more effectively than lime, its use is burdened by sludge handling and chemical recovery problems. Reverse osmosis through cellulose acetate membranes can achieve high color removals, but is presently uneconomical for kraft effluents. Cross-flow ultrafiltration through dynamically formed membranes at lower applied pressures can remove up to 99% of color, but is still in laboratory development stages. Some success has been achieved also with ion-exchange of bleach plant effluents. Pilot plant trials gave color removals to below 10 C.U. from unbleached kraft effluents and produced reuseable water by passage through multiple carbon columns after lime pretreatment. Costs of this process are less than for carbon treatment preceded by bio-oxidation and clarification (or by clarification alone) where discharged water quality requires 90% of BOD removal and color removal to 200 C.U. or less. A new carbon contact technique with still better economy is under development. (See also W74-12400) (Brown-IPC)

NEW FINE PARTICLE TECHNOLOGIES APPLIED TO THE ENVIRONMENTAL PROBLEMS OF THE PAPER INDUSTRY,
English China Clays Ltd., Saint Austell (England).
N. O. Clark.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 559-571, 1973. 8 fig, 1 tab.

Descriptors: *Sludge treatment, *Sludge disposal, *Particle size, *Solid wastes, *Liquid wastes, *Industrial wastes, *Pulp wastes, *Waste treatment, *Separation techniques, Equations, Darcys Law, Stokes Law, Clays, Calcium carbonate, Flocculation, Polyelectrolytes, Chemical precipitation, Water pollution control, Pulp and paper industry.
Identifiers: Kynch equation, Poiseuille equation, Talc, Polacrylamide.

Pollution by solids or liquids is easier to control than is the processing of sludges which require separation into a solid and a liquid phase. The separation of fine particles involves four theoretical equations, namely, Stoke's, Kynch's, Darcy's, and Poiseuille's Laws. The application of these physical-engineering principles to the practical removal or recovery of minerals, such as clays, talc, and calcium carbonate, is discussed and illustrated, including the use of retention and flocculation aids, such as polyacrylamide. A STUDY OF THE EFFLUENT TREATMENT FROM AN ITALIAN PAPER MILL,
Cartiera del Timavo, Trieste (Italy).
R. Ferretti.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 573-584, 1973. 11 fig.

Descriptors: *Pulp wastes, *Treatment facilities, Europe, Biochemical oxygen demand, Suspended solids, Flocculation, Filtration, Coagulation, Chemical precipitation, Bentonites, Aluminum, Polyelectrolytes, Filtration, Effluents, Waste treatment, *Waste water treatment, *Pollution abatement, Pulp and paper industry, Water pollution control, Industrial wastes.
Identifiers: Alum(Aluminum-potassium sulfate), White water, *Italy.

Antipollution treatments applied by an Italian groundwood pulp, newsprint, and printing paper mill to minimize BOD loadings and total suspended solids in its aqueous effluents are discussed and illustrated. Depending on the varying characteristics of discharges (from the barker room, grinder room, wire and felt showers, washing and cooling waters, etc.), the facilities provide a range of simple to sophisticated mechanical and chemical treatments, from decanters and bark-based filter basins to chemical flocculation and coagulation with alum, bentonite, and/or polyelectrolytes. Maximum BOD and suspended solids discharges of 20-30 ppm are reported. (See also W74-12400) (Brown-IPC)

SYSTEM OF COMBINED AND PROFOUND TREATMENT OF PULP AND PAPER INDUSTRY WASTE WATERS WITH ACTIVATED SLUDGE,
Vsesoyuznyi-Nauchnyi Planovii Otdel Bumazhnoi Promyshlennost, Moscow (USSR).
N. A. Evilevitch, M. A. Lomova, M. M. Nikiforov, B. S. Pritsker, and A. Ya. Tipisev.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 763-767, 1973.

Descriptors: *Treatment facilities, *Pulp wastes, *Activated sludge, *Aeration, *Biodegradation, Foreign research, *Biological treatment, Aerated lagoons, Waste water treatment, Waste treatment, Industrial wastes, Pulp and paper industry, Oxidation, Organic loading, Biochemical oxygen demand, Nutrients, Phosphorus, Nitrogen, Nitrogen compounds, Phosphorus compounds, Microorganisms, Equipment.
Identifiers: *USSR, Aerators, Multistage processes.

A modified three-stage activated sludge process is outlined, which avoids most of the disadvantages of conventional biological effluent treatment systems. Partial removal of oxidized pollutants in first-stage equalizers is followed by high-rate oxidation (2000-3000 g/cu m/day) in a second stage equipped with mechanical aerators which remove 70-80% of the BOD load at a BOD:N:P nutrient ratio of 100:4:1. Final 'profound' (in-depth) treatment with specific microfloral cultures occurs in third-stage high-load aeration ponds equipped with self-suction type aerators. (See also W74-12400) (Brown-IPC)

A PILOT PLANT STUDY FOR THE TREATMENT OF PAPERMILL AND DEINKING EFFLUENTS,
American-Israeli Paper Mills Ltd., Hadera (Israel).
L. Rakosh.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 769-780, 1973. 5 fig, 5 tab, 2 ref.

Descriptors: Treatment facilities, *Pilot plants, *Waste water treatment, *Pulp wastes, *Waste treatment, Pulp and paper industry, *Water reuse, Water conservation, Recirculated water, Irrigation, Flocculation, Activated sludge, Suspended solids, Turbidity, Industrial water, Biochemical oxygen demand, Biodegradation, Organic loading, Recycling, Discharge(Water), Waste water(Pollution), Sedimentation.
Identifiers: White water, *Israel, De-Inking wastes, Waste paper, Attisholz process, Paper machines, Paper mills.

An Israeli paper mill which, until recently, discharged its untreated effluent into a local stream, has installed a new treatment facility comprising primary sedimentation followed by two-stage activated sludge treatment in an Attisholz (Swiss-developed) pilot unit which handles the combined white waters from two paper machines producing offset printing, kraft wrapping, and newsprint papers. At volumetric loadings of 3-4 kg of BOD per day per cu m of aeration volume, low turbidities (suspended solids) were achieved with some flocculant addition to the second stage. Without biological treatment, 7 to 20 times as much flocculant would have been needed. At higher pollution loads of 6-8 kg BOD, the same turbidities were obtained without flocculants. Deinking effluent (from waste paper deinking) was readily biodegradable. The process responded well to frequent changes in water composition resulting from paper grade changes, and to variations in pollution load. The treated effluent could be recirculated or disposed of as irrigation water. (See also W74-12400) (Brown-IPC)

METHOD FOR TREATING OIL-CONTAINING WASTES,
M. Ohta.
U.S. Patent No 3,809,631, 2 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 922, No 1, p 274-275, May 7, 1974.

Descriptors: *Patents, *Industrial wastes, *Oil wastes, *Electrolysis, *Pollution abatement, Water quality control, Water pollution control, *Waste water treatment, Oily water.

Industrial wastes containing oils and surfactants are treated by adjusting the pH of a waste to 3 or less. The waste is then subjected to electrolytic treatment wherein the oil phase is separated out. In the first-stage electrolytic treatment a titanium-lead oxide composite electrode is employed as an acid-resistant anode. The remaining waste water is again subjected to electrolysis. This time the electrodes are composed of aluminum thereby precipitating the surfactants as sludge separated from water. (Sinha-OEIS)
W74-12433

PROCESS FOR REMOVING CHROMIUM FROM COOLING TOWER BLOWDOWN STREAMS,
Texas Gulf, Inc., New York.
A. Gloster, and H. G. Boockino.
U.S. Patent No 3,810,542, 4 p, 3 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 922, No 2, p 522, May 14, 1974.

Descriptors: *Patents, Pollution abatement, *Cooling towers, *Chromium, *Industrial wastes, *Waste water treatment, Water pollution control, Water quality control, Acid streams.
Identifiers: Chemical treatment.

A procedure for combining the streams from a cooling tower and an acid plant scrubbing tower to reduce the pollution problems of these industrial waste water is disclosed. The cooling tower stream is characterized by the presence of chromium products in which the chromium is in the hexavalent state, such as chromic acid or a chromate salt which are common corrosion inhibitors in cooling waters. The acid plant scrubbing tower has an acidic component such as sulphur dioxide dissolved in water. By combining these two streams the hexavalent chromium under acidic conditions is converted to trivalent chromium. The combined streams are then neutralized to precipitate chromium hydroxide and other compounds which are undesirable in the effluent. After settling out the chromium hydroxide and other compounds the waste stream may be discharged without presenting a pollution problem. (Sinha-OEIS)
W74-12434

MOBILE PURIFYING PLANT FOR WASTE WATER,
Aktiebolaget Gustavsbergs Fabriker (Sweden). (assignee).
B. O. Lundqvist.
U.S. Patent No 3,810,543, 3 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 922, No 2, p 522, May 14, 1974.

Descriptors: *Patents, *Waste water treatment, *Biological treatment, Pollution abatement, Water pollution control, Water quality control, *Water purification, Aluminum sulphate, Separation techniques.

A purifying plant for waste water consists of a mobile housing of a size to be transported on public highways. The housing contains means for the biological purification of the waste water, means for mixing aluminum sulphate into the biologically purified water, a separator to separate the deposited particles from the water, and a tank to collect the particles separated in the separator. The various apparatuses are situated at one wall of the housing, so as to create a compact plant. (Sinha-OEIS)
W74-12435

ELECTROLYTIC FLOTATION,
Simon-Hartley Ltd., Stoke-on-Trent (England).
E. P. Austin.
U.S. Patent No 3,817,865, 2 p, 8 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 1068, June 18, 1974.

Descriptors: *Patents, *Flotation, *Electrolysis, *Activated sludge, *Waste water treatment, Pollution abatement, Water pollution control, Electrodes, Gases, Bubbles, Equipment, Effluent.

In the flotation apparatus, the liquid to be treated is caused to flow through a tank equipped with at

least one electrode assembly. Gas bubbles are generated by electrolytic action. The gas bubbles cause suspended matter to rise to the surface of the tank to be skimmed off for removal. The removal device comprises endless chains supported on sprocket wheels at opposite sides of the tank. The chains are driven so that scraper blades remove the thickened material for disposal into a suitable waste collector. (Sinha-OEIS)
W74-12439

METHOD FOR TREATING WASTE WATERS,
Fried-Krupp G.m.b.H., Essen (West Germany).
B. Hoke.
U.S. Patent No 3,817,862, 4 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 1068, June 18, 1974.

Descriptors: *Patents, *Filtration, *Waste water treatment, *Organic wastes, *Aeration, *Chemical oxygen demand, Pollution abatement, Water quality control, Water pollution control, Activated carbon, Ion exchange, Carbon.

Waste water containing emulsified and dissolved, oxidizable, organic substances is added to a catalyst selected from a group consisting of carbon and ion exchangers. Air is forced through the resulting mixture, increasing the interfacial area between them. The treatment is discontinued when the chemical oxygen demand and permanganate consumption values have been reduced. The treated mixture is then filtered through a bed of activated carbon. (Sinha-OEIS)
W74-12440

METHOD OF COAGULATING SUSPENDED SOLID IMPURITIES IN WATER WITH SILICONE-SILICA COMPOSITIONS,
G. M. J. Slusarczuk, and J. F. Brown, Jr.
U.S. Patent No. 3,817,861, 10 p, 8 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 1068, June 18, 1974.

Descriptors: *Patents, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, *Flocculation, Electrolytes, Suspended solids, *Coagulation.
Identifiers: Silicic acid, Silane, Silicone, Biocolloids.

Water-dispersed compositions have been prepared by contacting 'soluble silica' with a hydrolyzed carbon-functional silance. The macromolecular structure present in this composition may consist of silicic acid polymer molecules, the outer surfaces of which are partially covered with cationic silicone molecules attached thereto. One specific system that has been found to produce very effective flocculants, particularly for the removal of biocolloids from wastewater, is produced by the reaction between a silicic acid sol and an aminofunctional aliphatic silane. The flocculative effectiveness of the silicic acid polymer molecules so modified can be explained on the basis of the probable manifestation thereby both of the mechanism of attachment characteristic of silica sol and of the mechanism of attachment characteristic of cationic polyelectrolytes. (Sinha-OEIS)

WASTE WATER TREATMENT METHOD,
Texaco, Inc., New York.
J. F. Tate.
U.S. Patent No. 3,817,859, 3 p, 3 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 1067, June 18, 1974.

Descriptors: *Patents, Chemical reactions, *Liquid wastes, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, Acidity, Sulfides, Alkaline earth metals, Metals, Alkaline water, Hydrogen ion concentration.
Identifiers: *Pollution prevention, Cresylates, Iron salts.

In the case where two streams of waste water are alkaline and are capable of forming a solid precipitate upon contact with each other, the pH is lowered to an acidic range to inhibit the formation of a precipitate or to dissolve any precipitate already formed. The waste in the original streams might be in the category of sulfides, cresylates and soluble iron salts and alkaline earth metal ions. The acid recommended is hydrochloric acid. (Sinha-OEIS)
W74-12443

AEROBIC SEWAGE TREATMENT SYSTEM,
Coate Burial Vault, Inc., West Milton, Ohio.
K. J. Yost.
U.S. Patent No. 3,817,858, 5 p, 8 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 1067, June 18, 1974.

Descriptors: *Patents, *Liquid wastes, *Sewage treatment, *Aerobic treatment, *Chlorination, *Waste water treatment, Water treatment, Pollution abatement, Water pollution control, Water quality control, Equipment.
Identifiers: *Water clarification.

Liquid sewage is directed generally tangentially into a large, flat and shallow aerobic settlement tank to expose a large surface area of the sewage per unit volume. Air is circulated over the surface of the sewage in a spiral direction to effect circulation or turbulence of the sewage within the tank and diffusion of the air into the liquid. The air flow within the tank is produced by connecting the air outlet of the tank to a chimney which projects upward adjacent to the outer wall of the residence and creates a natural draft. The liquid treated in the aerobic settlement tank is directed into a similarly shaped aerobic digestor and clarifier tank which also provides for circulation of the treated liquid and diffusion of the air in response to a generally spiral flow of air also created by the chimney draft. The second tank defines an annular clarifier chamber which receives the treated liquid before it is discharged. The discharged effluent may be directed through a chlorinator formed by a vertical housing which receives a supply of chlorine crystals. The crystals are urged downward into the path of the effluent by a combined weight and valve which is effective to stop the flow of treated liquid in the event additional chlorine crystals are not added to the supply. (Sinha-OEIS)
W74-12444

TREATMENT OF WASTEWATER,
Autotrol Corp., Milwaukee, Wis.
W. N. Torpey.
U.S. Patent No. 3,817,857, 5 p, 7 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 1066, June 18, 1974.

Descriptors: *Patents, *Waste water treatment, *Biological treatment, *Oxidation, *Denitrification, *Pollution abatement, Water pollution control, Water quality control, Equipment.
Identifiers: *Activated slime, Nitrogenous wastes, Carbonaceous wastes.

Wastewater is treated by the use of a mixture of biologically activated slimes attached to partially submerged rotating contractors, in order to accomplish the oxidation of carbonaceous and nitrogenous matter. The contractors are mounted in a single-stage treatment unit. They are supplied with wastewater at a controlled rate relative to the surface of the contractors and are distributed evenly over the surface of the contractors. A denitrifying unit is supplied with wastewater and recirculated effluent from the single-stage treatment unit. The denitrifying unit utilizes biologically active slimes attached to rotating biological contractors for the removal of carbonaceous matter from the wastewater supported by nitrate oxygen from the recirculated effluent. (Sinha-OEIS)
W74-12445

APPARATUS FOR REMOVING PARTICULATE MATTER,
B. Michel, and A. A. Delaney.
U.S. Patent No. 3,817,383, 7 p, 8 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 950, June 18, 1974.

Descriptors: *Patents, *Water treatment, *Waste water treatment, Hydraulics, Water quality control, Water pollution control, *Pollution abatement, Equipment, Separation techniques.

The device is intended to remove trash, ice particles or other suspended materials through hydraulically created forces. The structure is provided with a passage such that three stratum or layers of the liquid are formed. A splitting means is placed in the passageway permitting the first strata to flow out of one discharge area, the second and third through separate discharge areas. The device is either partially or totally submergible in water. The shape of the passageway generates a stream velocity which permits formation of an upper strata carrying flotable particulate matter, and a lower strata which contains and carries settable matter. The splitter separates these so that the intermediate 'cleaned' strata are discharged to the site to be utilized. (Sinha-OEIS)
W74-12447

METHOD FOR THE TREATMENT OF WATER,
Mitsui Mining and Smelting Co. Ltd., Tokyo (Japan).
M. Ichiki, and K. Nakade.
U.S. Patent No. 3,816,276, 3 p, 6 ref; Official Gazette of the United States Patent Office, Vol 923, No 2, p 673, June 11, 1974.

Descriptors: *Patents, *Pollution abatement, *Electrolysis, *Waste water treatment, Water pollution control, Water quality control, Metals, Oily wastes, Suspended solids, Flotation.

The method involves three processes to remove metal ions, oils or suspended solids. In the first process water is electrolyzed in an electrolytic cell with an anode of aluminum or aluminum alloy while blowing air into the water so the insoluble compounds are formed. In the second, anionic water-soluble high molecular materials are added to the water so that the compounds are converted into coagulums which float on the surface. Water remaining from the second process is electrolyzed in a second electrolytic cell provided with an insoluble anode so that all the coagulums are floated to the surface for removal. (Sinha-OEIS)
W74-12448

REMOVAL OF DISSOLVED OR SUSPENDED SOLIDS IN WASTE WATER,
Swift and Co., Chicago, Ill.
H. T. Anderson.
U.S. Patent No. 3,816,274, 5 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 923, No 2, p 673, June 11, 1974.

Descriptors: *Patents, *Emulsions, *Waste water treatment, *Oily wastes, *Waste water treatment, Pollution abatement, Water polution control, Water quality control, Suspended solids, Flotation, Chemical reactions, Hydrogen ion concentration.
Identifiers: Anolyte.

Greasy matter is separated by conveying an emulsified water fat solution to a first zone of a container where the walls act as a cathode. Anodes are placed transverse to the entry flow of the solution. The pH changes at least 2 units conveying the solution to a second zone having anodes positioned so that the lowest potential is greater than 0.6 volts but not more than 3 volts and impressing electrical current throught the solution forming a three dimensional anolyte body of solution. The fat particles separate from the water and float to the surface for removal. (Sinha-OEIS)
W74-12449

ARRANGEMENT FOR CONTINUOUS TREATMENT OF POLLUTED LIQUIDS,
Ceskoslovenska Akademie Ved, Prague.
S. ,Mackrle, and V. Mackrle.
U.S. Patent No. 3,815,750, 7 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 923, No 2, p 550, June 11, 1974.

Descriptors: *Patents, *Flocculation, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, Equipment, Sludges, Sedimentation, Filtration.
Identifiers: *Bioflocculation.

An arrangement for the continuous treatment of polluted liquids by a bioflocculation process comprises a bioflocculation space and a chamber having a perfectly fluidized sludge blanket situated above the bioflocculation space. The bioflocculation space is enclosed in at least two connected vessels of cylindrical shape having outer mantles with a horizontal axis, aligned side by side, the bottom of the chamber having the perfectly fluidized sludge blanket being formed at least partly by the mantles of the bioflocculation vessels. Means for supplying oxydation gas into the bioflocculation space and means for promoting a helical and circulating motion in the vessels forming the bioflocculation space are provided. Polluted liquid is converted to a suspension. A sedimentation channel is inclined with respect to a vertical line and the adjacent bioflocculation space. (Sinha-OEIS)
W74-12452

TREATMENT OF SEWAGE OR CONTAMINATED WATER,
Albright and Wilson Ltd., Oldbury, (England).
D. A. Swales.
U.S. Patent No. 3,814,686, 3 p, 4 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 923, No 1, p 264, June 4, 1974.

Descriptors: *Patents, *Sewage treatment, *Coagulation, *Industrial wastes, *Waste water treatment, *Water pollution treatment, Iron, Aluminum, Magnesium, Chromium, Chemical precipitation, Treatment.
Identifiers: Chrome residue, Metal salts.

A method is disclosed for removing suspended solids from contaminated water by adding a coagulant. The coagulant is prepared by digesting chrome residue containing 35-40% by weight of Fe203, 27-32% A1203, 13-18% MgO, and 12-17% Cr203 with a strong mineral acid selected from the group consisting of 20-36% by weight hydrochloric acid and 20-100% by weight sulphuric acid to form a solution of metal salts, the solution containing trivalent iron, aluminum, and chromium ions, and magnesium ions. (Sinha-OEIS)
W74-12454

AERATION APPARATUS,
Envirotech Corp., Salt Lake City, Utah.
D. Di Gregorio, and G. L. Shell.
U.S. Patent No. 3,814,396, 4 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 923, No 1, p 193, June 4, 1974.

Descriptors: *Patents, *Waste water treatment, *Aeration, Pollution abatement, Water pollution control, Water quality control, Bubbles, Equipment.

The apparatus comprises a non-impelling bubble shearing mechanism secured to and rotatable with the submerged end of a vertical shaft. An axial flow impeller is fixed to the shaft above the shearing mechanism to rotate with it. The impeller drives liquid downward past the shearing mechanism to intersect and entrain the sheared bubbles. This provides increased retention of the mixture in the lower portion of the liquid, and additional contact between sheared bubbles and recirculating liquid before the bubbles rise to the liquid surface. The shearing mechanism includes a hollow cylinder having an open bottom to receive bubbles, a closed top concentrically secured to a rotating shaft, and a slotted sidewall through which the bubbles are released and sheared. (Sinha-OEIS)
W74-12456

REVERSE OSMOSIS FOR MUNICIPAL WATER SUPPLY,
Du Pont de Nemours (E.I.) and Co., Inc., Wilmington, Del.
C. P. Shields.
Water and Sewage Works, Vol 119, No 1, p 64-70, January, 1972. 7 fig, 2 tab.

Descriptors: *Reverse osmosis, *Municipal water, *Desalination processes, *Water treatment, Ions, Water quality, Waste water treatment, *Water supply.

Reverse osmosis is the newest water treatment process in a decade and provides an important tool for improving water quality and utilizing previously untapped sources of water. The principal applications for reverse osmosis are in the desalting of brackish water having total dissolved solids between 1,000 and 15,000 mg/l. Minerals removed include Fe, Ca, Mg, Na, K, bicarbonate, chloride, sulfate and fluoride. RO is a membrane process that acts as a molecular filter to remove up to 90-95 percent of all dissolved organics, and 98+ percent of biological and colloidal matter. The most important capability for municipal water treatment is reduction of the excess dissolved solids. Reverse osmosis costs have now reached the point where desalting is justified for communities currently using poor quality water and is competitive with conventional means of acquiring additional supply. (Jernigan-Vanderbilt)
W74-12513

FILTRATION OF OILFIELD PRODUCED WATERS,
J. T. Wallace.
Society of Petroleum Engineers of AIME Preprint SPE 4251, 1972. 6 p, 7 fig.

Descriptors: *Filtration, *Waste water treatment, Water purification, Water quality control, *Well filters, Water pollution, *Groundwater, Oil wastes, Oily water, Brine disposal, *California.
Identifiers: *Long Beach(Calif), Contamination, *Permanent media pressure filters, Automatic backwash system.

The city of Long Beach, California was recently awarded first prize in a national environmental competition for pioneering a program of getting the various field operators to build filtration systems to handle produced oil field brinewater, and then to reinject the filtered wastewater back underground, serving the dual purpose of eliminating a potential pollution problem and helping to curb subsidence. The produced water may contain as much as 25 to 50 parts per million of oily residue and an equal quantity of suspended solids, but it is also oxygen deficient. The oily residue and solids have little effect on marine life, but the oxygen deficiency would be detrimental. The application of deep bed dual media filters as the final step before injection made the program economically feasible by removing the majority of the contaminants and making injection into the aquifers a reality. (Campbell-NWWA)
W74-12539

NITRIFICATION AND DENITRIFICATION FACILITIES. WASTEWATER TREATMENT,
Metcalf and Eddy, Inc., Boston, Mass.
C. N. Sawyer, H. E. Wild, Jr., and T. C. McMahon.
Environmental Protection Agency Technology Transfer Seminar Publication, August 1973. 33 p, 24 fig, 3 tab, 13 ref.

Descriptors: *Nitrification, *Denitrification, *Treatment facilties, *Sewage treatment, Biochemical oxygen demand, Nitrates, Nitrogen, Ammonia, Hydrogen ion concentration, Temperature, Kinetics, Design, Settling basins, Sludge, Effluents, Pilot plants.
Identifiers: Nitrogenous oxidation.

Wastewater treatment plants designed to accomplish nitrification and denitrification require a three-stage biological system in climates where wastewater temperatures drop below 18C. The first stage is necessary to remove carbonaceous BOD-5 to levels of about 50 mg/l. The second stage is needed to accomplish nitrification and should be designed to employ the plug-flow principle as closely as possible. The third stage accomplishes denitrification. A source of carbonaceous BOD must be added to reduce the nitrates to nitrogen gas in a reasonable period of time. Studies showed that factors affecting nitrification kinetics are: the ammonia-nitrogen concentration did not inhibit nitrification in concentrations of less than 60 mg/l; pH did not affect the rate of nitrification (optimum 8.4); temperature did not affect the nitrification (rate increased through the range of 5 degrees to 30C); the time required for nitrification is directly proportional to the amount of nitrifiers in the system; instantaneous increases (from 50 to 110 mg/l) or decreases (from 50 to 5 mg/l) in BOD concentration did not affect the rate of nitrification. Design criteria and denitrification by suspended growth systems, are described both based on pilot plant data. (Jones-Wisconsin)

Descriptors: *Waste disposal, *Farm wastes, *Domestic wastes, *Recycling, *Algae, Water reuse, *Anaerobic digestion, *Waste water treat-

ment, Nutrients, Fermentation, Photosynthesis, Solid wastes, Liquid wastes, Pilot plants, Kinetics.
Identifiers: Anaerobic treatment.

A system with which a large fraction of the wastes produced by agricultural industries could be converted into a useful material without imposing an unacceptable burden on the environment was studied. Specifically, the project involved a detailed study of the basic characteristics of an integrated anaerobic fermentation and algae growth system for agricultural solid and liquid wastes on a laboratory and small pilot plant scale, with special attention devoted to the reaction kinetics of the system. A substantial degree of nutrient recovery and recycle can also be attained in the system. (Knapp-USGS)

SURVEY OF METHODS OF TREATING WINE AND GRAPE WASTEWATERS,
New York State Dept. of Environmental Conservation, Albany.
T. J. Tofflemire.
Am J Enol Vitic. Vol 23, No 4, p 165-172. 1972.

Descriptors: *Industrial wastes, *Waste water treatment, Effluents, *Biological treatment.
Identifiers: Grapes, *Wine.

The waste characteristics and treatment methods for wine and grape wastewaters are discussed. The wastewater is strong and highly variable, and tends to become odorous upon standing. Stillage represents a more concentrated and acidic wastewater that may require neutralization. The P and N content of the wastewater is less than ideal by the 1/30/150 standard. The treatment methods discussed include activated sludge systems, aerated lagoons, trickling filters, rotating biological discs, irrigation systems, anaerobic processes, and chemical processes.--Copyright 1973, Biological Abstracts, Inc.

SOIL MICROORGANISM METABOLISM IN SPRAY IRRIGATION,
North Texas State Univ., Denton.
G. R. Vela, and E. R. Eubanks.
J Water Pollut Control Fed. Vol 45, No 8, p 1789-1794. 1973. Illus.

Descriptors: Industrial wastes, *Waste water treatment, Effluents, Canneries, Irrigation systems, Bacteria, Soil bacteria, Metabolism.
Identifiers: *Spray irrigation treatment.

A study of the microbial activities in a spray irrigation treatment system for cannery wastewater showed that there was no enzymatic activity in the process water and that bacteria in the effluent contributed little or nothing to purification. Specific bacterial populations developed in the spray fields. These bacteria hydrolyzed polymers and oxidized monomers in the wastewater. Only 16 of 100 isolated species contributed directly to purification, although the remainder probably contributed indirectly. There was no correlation between total numbers of bacteria and oxidative capacity of the soils in the irrigation field.--Copyright 1974, Biological Abstracts, Inc.

TREATMENT OF OILY WASTES FROM A STEEL MILL,
McMaster Univ., Hamilton (Ontario).
D. R. Woods, and M. W. Slezak.
J Water Pollut Control Fed. Vol 45, No 10, p 2136-2145, 2239, 1973. Illus.

Descriptors: *Waste treatment, Distillation, Mixing, *Oil wastes, *Coagulation, *Solvent extraction, Wastes.

The theory of stability of an oily waste is reviewed. Two laboratory-scale processes are described to treat the waste. In the solvent extraction process, a small amount of electrolyte added to the oily waste feeds to a countercurrent mixer-settler solvent-extraction column. With water phase continuous and at a relatively high rpm for the mixing, good quality effluent could be obtained in 6 stages. The solvent could be recycled. Bench-scale operating conditions were identified. In the coagulation process, suitable coagulants were identified from jar tests. The dosage rates, pH, and oil removal rates found in the batch jar test agreed reasonably well with the results from a carefully scaled-down flow unit.--Copyright 1974, Biological Abstracts, Inc.

New York State Dept. of Environmental Conservation, Albany.
T. J. Tofflemire, M. Chen, F. E. Van Alstyne, L. J. Hetling, and D. B. Aulenbach.
December 1973. 72 p, 17 fig, 5 tab, 243 ref.

Descriptors: *Phosphorus compounds, *Phosphorus, *Soil chemical properties, *Soil physical properties, *Waste water disposal, *Pollutants, Soil chemistry, Soil investigations, Pollution abatement, Waste water treatment, Soil surveys, Soil testing.
Identifiers: *Phosphorus removal, *Phosphorus disposal.

An approach is presented for evaluating a land disposal site for phosphorus removed from wastewater. It involves: (1) making a field reconnaissance, (2) gathering literature data on soils, and geology; (3) determining the flow pathway of the wastewater; (4) taking soil samples in that pathway; (5) analyzing the soil samples for particle size distribution, pH and rapid phosphate adsorption capacity; and (6) calculating and adding the capacities of the various soil volumes involved. The land disposal system is then designed so that it does not exceed the phosphate adsorption capacity of the site for the time desired. Further studies should be conducted on long term phosphate mineralization or the site should be rejected as unacceptable. Because the necessary field data is difficult to gather, the approach involves a number

of assumptions and will yield a conservative estimate of the phosphorus removal. For very large treatment systems, column studies, field pilot studies and ground water modeling studies are also recommended. At an operating land disposal site, wells and lysimeters can be installed to measure resulting ground water quality. (Poertner)

THE TREATMENT AND REMOVAL OF WASTE WATER RESIDUAL SLUDGES IN THE PAPER INDUSTRY (DIE BEHANDLUNG UND BESEITIGUNG VON RESTABWASSERSCHLAEMMEN DER PAPIERINDUSTRIE),
Muenchen-Dachauer Papierfabriken Heinrich Nicolaus G.m.b.H. (West Germany).
G. Strittmatter.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 407-418, 1973. 9 fig.

Descriptors: *Sludge, *Pulp wastes, *Dewatering, *Sludge treatment, *Waste disposal, *Ultimate disposal, *Separation techniques, *Recycling, *Solid wastes, Incineration, Landfills, Filtration, Centrifugation, Effluents, Research and development, Marketing.

The separation, thickening (concentration), dewatering (by centrifugation or filtration), reuse, and disposal (by combustion, landfill, etc.) of paper mill effluent sludges are discussed. Although separation and sludge treatment problems are largely solved, the recirculation of white water sedimentation sludge into commercial marketable products, such as flameproof building panels, will require much more research and development work. HYDROLOGY OF RADIOACTIVE-WASTE DISPOSAL AT THE IDAHO CHEMICAL PROCESSING PLANT, NATIONAL REACTOR TESTING STATION, IDAHO,
P. H. Jones.
Geological Survey Research, Article 420, 1961. p D-374-D-376, 2 fig, 1 tab, 1 ref.

Descriptors: *Radiation, *Groundwater, Reservoirs, Basalts, Silts, Gravel, Sand, Brine, Aquifers, Petrology, Hydrology, Water wells, Boreholes, Gamma rays, Waste water(Pollution), Salinity, Water quality, Waste disposal, *Idaho.
Identifiers: National Reservoir Testing Station(Ida), *Radioactive-waste disposal, *Intercept wells, Vertical flow.

Low-level aqueous radioactive waste (less than 10 to the minus 4 microcuries per milliliter, gross beta-gamma) is pumped directly into the groundwater reservoir at the Idaho Chemical Processing Plant (ICPP) through a drilled, cased, gravel-packed well 598 feet deep. This well penetrates several thin basalt flows and a single thin bed of silt, sand, and gravel below the water table, which occurs at a depth of about 460 feet. Radioactive waste is diluted with warm nonradioactive water from plant wastes, including large amounts of sodium-chloride brine from water-softening units. Since 1952, 757 curies of activity have been disposed to this well in 2 1/2 billion gallons of water. Vertical flow between aquifers tapped by intercept wells results in an erratic distribution of waste water in the ground-water reservoir and makes measurements of water level in the well useless for quantitative purposes. Effective study of vertical flow requires reconstruction of intercept wells so that they tap but one aquifer. Where this has been done using modified oilwell packers, head differences between aquifers generally occur in waters from different aquifers tapped by the same well. (Campbell-NWWA)

DISPOSAL OF URANIUM-MILL EFFLUENT NEAR GRANTS, NEW MEXICO,
S. W. West.
Geological Survey Research, Article 421, 1961. p D-376-D-378, 2 fig, 1 tab.

Descriptors: Effluents, Potable water, Aquifers, *Groundwater, Limestones, Mills, Stratigraphy, Alluvium, Basalts, Disposal, Sandstones, Bedding, Injection wells, Faults(Geologic), Fractures, Pressure, *New Mexico.
Identifiers: *Uranium-mill effluents, San Andres limestone, Glorieta sandstone, Evaporation pond.

Disposal of uranium-mill effluent at the Anaconda Co. Bluewater Mill, 9 miles northwest of Grants, N. Mex., became a problem in a relatively short time after the mill was built in 1952. The use of an evaporation pond in a natural depression and much research by The Anaconda Co. on impervious pond linings and on other methods of surface disposal indicated that surface methods of disposal might contaminate the potable ground water. The company then investigated the possibility of injecting the waste fluids into an unused aquifer that contains non-potable water and is below, and isolated from, the principal sources of ground water in the area. There are many faults in the region, and it was feared that fractures in the fault zones might be conduits through which water could move from one formation to another. It seemed possible, also, that permeable beds might be offset against impermeable beds forming barriers to lateral movement of water away from the injection well and causing excessive buildup of hydraulic pressure in the disposal zone. The initial injection test indicated that vertical leakage was negligible and that one or more faults are barriers to lateral movement of the water. Temporary cessation of injection at critical times during the test period obscured the reaction of the water level to the probable barrier. Thus, the future pressure buildup cannot be forecast until more is learned about the effects of the barrier. (Campbell-NWWA)

5F. Water Treatment and Quality Alteration

STUDY RELATING TO THE USE OF A PROCESS CONTROL COMPUTER FOR A WATER TREATMENT PLANT IN FRANCE,
Compagnie Generale des Eaux, Paris (France).
D. Coyaud.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 229-239, 25-27 September 1973. 3 ref.

Descriptors: *Industrial plants, *Management, Computers, Control, *Water treatment, *Treatment facilities, Water quality, Data processing, Investment, Pumping, Ozone, Monitoring, Operating costs, Europe, Statistics.
Identifiers: *Process control, *France, Filter washing, Caustic soda, Raw water, Savings.

The management of modern industrial plants presents many intricate problems difficult to solve. Therefore, computers operating in real time are being used to assist the technical management. The Compagnie Generale des Eaux proposes to install a process control computer in its plant at Neuilly-sur-Marne. The computer will control the pumping and treatment equipment existing on site, and as a second stage it will be extended to structures and networks outside the plant. Discussed are the functions to be initially ensured: (1) supervision of about 160 measurements, 360 status conditions and 230 alarm conditions; (2) data processing yielding information easily usable by staff in charge of plant; (3) issue of reports and statistics; (4) optimized control of sub-assemblies (i.e., pumping program, equal distribution of the flow, best conditions for filter washing, etc); and (5) management of chemical stocks through off-line programs, together with group maintenance schedule, statistics and data analysis. The initial investment and the running costs have been estimated, as well as expected savings. Installations using computers in Europe (Chambrey, France, St. Gall, Switzerland, and Luxemburg dam) are given as examples. (See also W74-12107) (Bell-Cornell)

COMPUTER USE IN US WATER AUTHORITY,
Chicago Dept. of Water and Sewers, Ill.
J. B. Corey.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 241-249, 25-17 September 1973. 2 fig, 1 append.

Descriptors: *Water works, Computers, *Control, Regions, Management, Operation and maintenance, Monitoring, *Water treatment, Treatment facilities, Water quality, Water quantity, Water utilization, Lake Michigan.
Identifiers: *Chicago(Ill), *Process control, *Filtration plants, Reporting, Physical set-up.

The City of Chicago waterworks system is outlined and the extent to which process computer capability is utilized is considered in more detail. The physical set-up is described together with the monitoring and reporting functions of the system. All computer capability is at present located in the Central Water Filtration Plant, the world's largest water treatment plant; an Appendix is included which briefly describes this installation. A typical flow diagram is shown. In conclusion, possible future developments are indicated. (See also W74-12107) (Bell-Cornell)
W74-12120

THE START-UP MODEL OF A RAPID SAND FILTER,
Philips Forschungslaboratorium G.m.b.H., Hamburg (West Germany).
M. Klinck.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England. p 101-104, 25-27 September 1973. 2 fig, 3 equ, 1 ref.

Descriptors: *Water treatment, *Water quality control, *Treatment facilities, *Filters, *Simulation analysis, Effluents, Operation and maintenance, Design, Pipe flow, Control, Model studies, Computers, Systems analysis.
Identifiers: Rapid sand filters, Start-up model, Washing procedure.

Rapid sand filters play a very important role in many water treatment plants. An operation model can be built as the basis for the design of the corresponding level control loop. With this operation model, which describes the static and dynamic behavior, the structure of the level controller can be designed and the parameters can be chosen. During the startup period after a washing procedure, however, the operation model for the rapid sand filters is not valid. Using simulation analysis, a start-up model is derived and the start-up behavior of the level-controlled rapid sand filter is investigated. Use of a simulation language for continuous systems running on a digital computer is advantageous in such investigation. Much money can be saved during the installation and test period of a plant, if use is made of simulation-aided design methods for the control of complete water treatment plants. METHOD OF DISINFECTING WATER AND DEMAND BACTERICIDE FOR USE THEREIN,
Kansas State Univ., Research Foundation, Manhattan.
J. L. Lambert, and L. R. Fina.
U.S. Patent No. 3,817,860, 6 p, 3 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 1067, June 18, 1974.

Descriptors: *Patents, *Water purification, *Water treatment, *Disinfection, *Bactericides, Halogens, Iodine, Iodides, Microorganisms, Bacteria, Resins, Anion exchange, Waste water treatment.
Identifiers: *Chemical treatment, Triiodide resins.

A method of treating bacterially contaminated water for direct production of disinfected water ready for use is disclosed. The water is rendered bacterially sterile by passing it through a strongly basic anion exchange resin containing combined triiodide without forming a detectable concentration of iodine in the disinfected water. The triiodide is combined in a stable form with the basic groups of the resin. Although the dissociation of the iodine of the resin-insolubilized triiodide is extremely low, the triiodide resins are highly bactericidal, the triiodide groups reacting on demand with bacteria in water suspensions to kill the bacteria. Available from NTIS, Springfield, Va. 22161 as AD-763 154. Price $3.00 printed copy; $2.25 microfiche. Report 2058, May 1973. 11 p, 2 fig, 3 tab. MIPR-Z-70099-1-13218.

Descriptors: *Separation techniques, *Oily water, *Ships, *Water pollution control, Waste water treatment, Equipment, Evaluation, Water pollution treatment.

A 10-gpm liquid/liquid separator was tested to determine its suitability as a shipboard oil pollution control device. The separator is more effective with coalescer elements installed in all three stages. Redesign of the vessel may be required, however, to enhance complete separation and removal of coalesced oil at high oil injection rates. The high pressure drop across the test unit at the increased flow rate and the test unit weight-to-capacity ratio are excessive. The separator is a two-stage (later converted to three stages by the manufacturer) coalescence-type device. (Knapp-USGS)

Development Sciences, Inc., East Sandwich, Mass.
M. Gorden, and M. Gorden.
Available from NTIS, Springfield, Va 22161 as PB-221 890 Price $5.45 printed copy; $2.25 microfiche. Contract Report, July 1972. 127 p. NSF Grant C-673.

Descriptors: *Information exchange, *Pollution abatement, *Planning, Data collections, Publications, Ecology, Information retrieval, Data storage and retrieval, Systems analysis.
Identifiers: *Information systems.

The Effluent Management Information System deals with generating new alternatives to pollution abatement, disseminating known techniques, and providing a systematic framework for evaluating the quantitative potential of industrial response to government policy. It identifies alternatives through a materials flow analysis which links firms to find compatible solutions to pollution control. Incorporating economic criteria of increasing productivity from efficient waste management, and applying ecological criteria, the Effluent Management Information System identifies firms within and among 8-industries which could benefit from resource recovery, shared capital investment in treatment centers, and land assimilable waste. A man-machine combination adds known solutions and new alternatives to facilitate dissemination of choices to government policymakers and industry. The system can also indicate in what specific regions a range of solutions is possible, thus giving planners insight into present possible responses and future planning alternatives. The system is also linked to a land use planning tool for siting of new industry. Through the application of these management tools, the conflict between economic growth and environmental quality can be minimized. (Knapp-USGS)

WATER QUALITY CONSIDERATION FOR THE METAL MINING INDUSTRY IN THE PACIFIC NORTHWEST,
Environmental Protection Agency, Seattle, Wash.
J. E. Sceva.
Available from NTIS, Springfield, Va 22161 as PB-226 995 Price $7.75 printed copy; $2.25 microfiche. Environmental Protection Agency Report No Region X-3, 1973. 89 p, 1 fig, 4 tab, 12 ref, 3 append.

Descriptors: *Mining, *Mine wastes, *Water pollution control, Mine acids, Mine water, Acid mine water, Spoil banks, Waste dumps, Water pollution sources, Legislation, Water law, *Water quality standards.

The principal causes of water pollution at both active and abandoned mines are discussed. Recommendations are given for minimizing the effects of mining on water quality. The 1972 Federal Water Pollution Control Act contains many provisions that relate directly with mining operations. It establishes a national goal of eliminating the discharge of pollutants into the waters of the United States by 1985. Interim goals call for the application of best practicable control technology by 1977 and the best available technology by 1983. The FWPCA also requires the states to establish water quality standards for all surface waters. These standards describe water quality conditions that are acceptable to the states and Federal government. The standards for turbidity, suspended solids and heavy metals will have a direct effect on mining operations. (Knapp-USGS)

REAERATION IN OPEN-CHANNEL FLOW,
Canada Centre for Inland Waters, Burlington (Ontario).
Y. L. Lau.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 257-272, 1973. 3 fig, 1 tab, 13 ref.

Descriptors: *Reaeration, *Oxygenation, Self-purification, Water quality, Reviews, Dimensional analysis, Regression analysis, *Open channel flow.

Theoretical models of the mechanism of oxygen absorption are reviewed; they are deficient as far as prediction of the reaeration rate is concerned. Empirical prediction equations resulting from regression analysis of laboratory or field data are applicable over only small ranges of flow conditions. The governing parameters in the process of reaeration in open-channel flow were identified through use of dimensional analysis. The discrepancy which has been suggested to exist between some sets of flume data was actually the result of the method of analysis. A new prediction equation is proposed. CONTROL OF SEA WATER INTRUSION BY SALTWATER PUMPING--A MATHEMATICAL MODEL,
MacLaren (James F.) Willowdale (Ontario).
A. F. Ashamalla, and P. L. Hall.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 337-354, 1973. 4 fig, 9 ref.

Descriptors: *Saline water intrusion, *Drawdown, *Aquifers, *Groundwater movement, Pumping, *Mathematical models, *Canada, Withdrawal, Simulation analysis, Saline water barriers.
Identifiers: *Shippegan(NB-Canada).

A mathematical model was built to simulate the effect of pumping on saltwater intrusion in coastal aquifers. The model calculates the motion of a shallow interface in either a phreatic or confined aquifer of varying thickness and properties. Any pattern of recharge by natural replenishment or discharge by pumping at different locations can be simulated. An implicit scheme is used for the solution of the partial differential equations, with changeable size and time increment. The model was used for the solution of an intrusion problem at Shippegan, New Brunswick. The movement of the saltwater wedge along various profiles was computed in response to freshwater pumping. In order to control the intrusion, a saltwater well was located in the model at different locations, and the movement of the saltwater wedge was predicted for different pumping rates. The best locations and pumping rates for the saltwater wells were found

for the prevailing natural boundary conditions and the required water demand. (See also W74-12087) (Knapp-USGS)

COMPUTER SERVICES AND APPLICATION IN THE GREATER LONDON COUNCIL'S DEPARTMENT OF PUBLIC HEALTH ENGINEERING,
Greater London Council (England). Dept. of Public Health Engineering.
A. R. Bovington, and E. L. Patient.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 10-19, 25-27 September 1973. 1 fig.

Descriptors: Computers, *Water resources, *Public health, Engineering, *Computer programs, Rivers, *Water pollution control, Flood control, Treatment facilities, Sewers, Management, Operations, Economics, Public utilities.
Identifiers: *Centralized computing, *London(Eng-UK).

The computing facilities used by the GLC's Department of Public Health Engineering, more than half of which will be involved in water reorganizztion, are described. Discussed are: the main installation, which is the responsibility of the Computer Branch of the Treasurer's Department; other installations, operating specialized computing equipment; Bureau facilities; and software support. Some of the major computer applications and proposed developments are described. Considered are: centralized management applications, including, among others, an accounting scheme, a trade effluents scheme, and a sophisticated stock control scheme; and technical applications, including river surface profile analysis, a sewer model, analysis of data logger output, simulation of refuse transfer stations, and analysis of treatment works operating data. Some proposed developments are a complete personnel information and retrieval system and a data base for sewer operation and management. The paper concludes with a discussion of the effectiveness of centralized computing in a large authority. (See also W74-12107) (Bell-Cornell)

FISH NUTRITION IN THE COOLER RESERVOIR OF THE LITHUANIAN ELECTRIC POWER STATION, (IN RUSSIAN),
Akademiya Nauk Litovskoi SSR, Vilnius. Institut Zoologii i Parazitologii.
L. A. Rachunas.
Gidrobiol Zh. Vol 9, No 5, p 21-27, Illus, 1973. English summary.
Identifiers: Electric powerplants, *Fish growth, *Heated water, Nutrition, Reservoirs, *Sewage, *USSR(Lithuania), Growth rate.

Heated water sewage has no harmful effects on the fodder base of fishes. It contributes to nutritional reserves formation in the winter period, providing fishes with food in other seasons. Some differences are found in food organism composition between heated and unheated zones. In the heated zone fishes feed actively all the year round, they show comparatively high growth rate and are characterized by fatness.--Copyright 1974, Biological Abstracts, Inc.

MIXING ZONE CONCEPTS,
National Academy of Sciences, Washington, D.C. Environmental Studies Board.
C. M. Fetterolf, Jr.
In: Biological Methods for the Assessment of Water Quality, 1973, Philadelphia, Pa., ASTM Special Technical Publication 528, p 31-45. 3 tab, 7 ref.

Descriptors: Aquatic life, *Mixing, Discharge(Water), *Water pollution, *Regulation, *Water quality control, Water management(Applied), *Waste water(Pollution), Standards, Specifications, Waste water disposal, Pollution abatement, Thermal pollution, *Water quality standards, Legal aspects, State governments, Mixolimnion, Effluents.
Identifiers: Aquatic biology, Assimilation, Mixing zones, Time exposure history, Thermal discharges.

There is no uniform approach among states to the designation of zones to accommodate liquid waste discharges into an aquatic receiving system without interfering with other beneficial uses. This leads to confusion and indecision among dischargers and enforcement agencies. Acceptance of universally adaptable guidelines would initiate understanding and progress. Such conceptual guidelines are proposed, including: initial establishment of the waste capacity of the receiving system; control of mass emission rate of critical materials; adoption of aesthetic criteria; establishment of water quality requirements in the mixing zone based on time exposure history; derivation of specialized criteria to permit overlapping mixing zones; assessment of damage to biota on a population basis; recognition that limited loss of living area may not be significant to populations; early acknowledgment that siting and discharge design can afford protection to uses; and that a case-by-case approach is essential to wise use of natural resources, even though it is more difficult than other ways of controlling mixing zones. ECONOMIC EFFECTS OF SUBSIDIES FOR WASTE ABATEMENT,
Clemson Univ., S.C. Dept. of Economics.
H. H. Macaulay.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 800, $4.50 in paper copy, $2.25 in microfiche. South Carolina Water Resources Research Institute Report No 43, Clemson, 115 p, 4 fig, 2 tables, 2 append, 40 ref, 1974. OWRT B-030-SC(6).

Descriptors: *Taxes, *Costs, Economics, Resources, Financing, Economic Efficiency, Cost allocation, Benefits, Investment, *Pollution abatement, *Pollution taxes(Charges), *Water quality control.
Identifiers: *Subsidies, *Charges, Externalities.

Environmental problems basically involve the use of environment by people and firms whose uses are often mutually exclusive. This approach has not been clearly seen because of an emphasis on (a) pollution rather than use of the environment, (b) compensation of victims of pollution instead of owners or the environment, (c) the public-good nature of the environment instead of its private-good aspects, and (c) technological externalities instead of pecuniary externalities created by other users. The asset-use approach supports user charges, while the case for subsidies must rest not on economic grounds but on equity or political grounds. However, both states and the Federal government grant to industries and municipalities. The value of the tax preferences given to industry has been insignificant relative to the expenditures required for pollution abatement, while those given to municipalities are now about $4 to $5 billion annually. Each of these subsidies fails to discourage the creation of waste and encourages capital intensive waste treatment. The largest subsidies are those provided by regulations requiring firms and municipalities to treat wastes so that those who want clean water may enjoy it. These subsidies appear to be between $3 and $10 billion annually and apparently produce benefits of much less value than the sums spent.

B. A. Simco.
Available from National Technical Information Service, Springfield, Va 22161 as PB-235 824, $3.25 in paper copy; $2.25 in microfiche. Tennessee Water Resources Research Center, Knoxville, Research Report 39, August 1974, 29 p, 2 tab, 6 fig, 26 ref. OWRT B-028-Tenn(1), 14-31-0001-4127.

Descriptors: *Channel catfish, *Fish management, *Recirculated water, *Water reuse, *Filters, *Fish farming, Fish hatcheries, Production.

Identifiers: Fish cultures.

Channel catfish can be cultured at high densities in carefully managed recirculating raceway systems. Various flow rates, exchange rates, and tank to filter ratios were investigated in eleven recirculating systems employing biological filters, settling chambers and foam strippers. Limestone, shells, styrofoam and teflon rings served as effective filter media, but coal slag restricted water flow and was not satisfactory. An equation was developed to evaluate the effects of system design on water quality. Water quality varies directly with fresh water exchange, flow rate per tank, and the filter size. Production was greater in systems with small tanks and large filters (5 lb/ft3) than in systems with large tanks and small filters (1 lb/ft3). Densities in excess of 7 lb/ft3 per tank have been obtained, indicating recirculating systems may become an increasingly important method of fish culture.

Copy Available from GPO Sup Doc as EP1.23:660/2-74-065, $0.70, microfiche from NTIS, Springfield, Va 22161 as PB-235 929 $2.25. Environmental Protection Agency, Technology Series, Report EPA-660/2-74-065, June 1974. 29 p, 2 fig, 2 tab, 29 ref. EPA Project 21AGF-16, Program Element 1BB040.

Descriptors: *Linings, *Soil sealants, *Impervious membranes, Waste disposal, Liquid wastes, Solid wastes, Permeability, Seepage, Monitoring, Liquid limits, Plastics, Mine wastes, Costs, Sealants, Seepage control.
Identifiers: Liner costs, Latexes, Fiberglass, Seepage detection, Mill tailings ponds.

A summary is presented of the rather limited information available in the literature pertaining to the use of sealants for mine and mill tailings ponds. Included is a discussion of currently employed seepage detection methods, as well as the various types of sealants currently in use--compacted earth, clays, chemicals, waste tailings solids, asphalt, and synthetic liners will prevent all seepage. Installation costs of the sealants, including labor, are discussed and graphs for estimating costs based on pond size are presented. Regulations governing the amount of seepage allowed are ill-defined or non-existent in the majority of States. (EPA)

Environmental Protection Agency, Technology Series Report EPA-660/2-74-036, May 1974. 95 p, 2 fig, 53 tab, 35 ref, append. EPA Contract 14-12-922, Program Element 1BB039.

Descriptors: *Pesticide removal, *DDT, *Reduction(Chemical), *Pesticide toxicity, Chlorinated hydrocarbon pesticides, *DDE, Pesticide kinetics, Water pollution control, Water pollution effects, Rainbow trout, Daphnia, Sun fishes, Reproduction, Minnows.
Identifiers: *Pesticide degradation, TTTB.

Laboratory studies were carried out as a part of initial development of a concept of controlled destruction of field applied DDT pesticide. Copper catalyzed aluminum reductant was shown to degrade DDT in 24 hr at 25C and 4 hr at 40C without forming DDE. Copper catalyzed iron required a week to reduce DDT at 25C and 8 hr at 40C. Acidity for field degradation of DDT can be supplied by solid acids such as sulfamic, oxalic, or citric. An integrated degradable particle was demonstrated by a 5 micrometer reductant particle overlaid with sulfamic acid and coated with DDT. Only moisture is needed to initiate decomposition. In a demonstration 98.4% of the DDT was destroyed in 6 days and 99.8% in 2 weeks at 25C. Product TTTB is 50-fold less fat soluble than DDT and nearly insoluble in water. Product DDEt is 20-fold more soluble than DDT in water. The vapor pressure of DDEt is about 80-fold greater than DDT. Exposure of fathead minnows bluegills and rainbow trout to water saturated with DDEt (.05ppm) or TTTB (.001 ppm) produced no acute toxic effects. The TLm of DDEt to Daphnia is about 35 ppb. Long term chronic exposure of fathead minnows to DDEt saturated waters showed no effect on adult growth and survival, egg production or hatchability. Growth and survival of freshly hatched fry were affected by DDEt above about .006 ppm. No effect on fathead minnow adult or fry growth and survival, egg production or hatchability was shown by TTTB saturated water. Nearly mature fathead minnows consumed 10 mg/kg body weight/day of DDEt to 980 mg/kg body weight/day of TTTB in food without apparent deleterious effect. (EPA)

FEASIBILITY OF EMISSION STANDARDS BASED ON PARTICLE SIZE,
Midwest Research Inst., Kansas City, Mo.
L. J. Shannon, P. G. Forman, and W. Park.
Copy Available from GPO Sup Doc as EP1.23:600/5-74-007, $2.50; microfiche from NTIS, Springfield, Va 22161 as PB-236 160, $2.25. Environmental Protection Agency, Socioeconomic Studies Series, Report EPA-600/5-74-007, March 1974. 221 p, 25 fig, 53 tab, 89 ref, 3 append. EPA Program Element 1HA091, Contract 68-01-0428.

Descriptors: *Standards, *Air pollution, *Feasibility studies, *Particle size, Economic feasibility, *Regulation, Benefits, Pollutants.
Identifiers: Particulates, *Emission standards, Technical feasibility, *Fine particle emissions.

The technical and economic feasibility of particulate emission standards based on particle size was assessed. Attention was focused on standards to regulate the emission of fine particulates--particulates below 2 microns in size. The program was divided into four major areas of effort: (1) Analysis of approaches for regulating fine particle emissions from stationary sources. (2) Definition of technological and economic requirements necessary for implementation of emission standards. (3) Identification of benefits that would accrue if control procedures for fine particulates can be implemented. (4) Assessment overall feasibility of implementation of fine particle emission standards. (EPA)

Descriptors: *Permafrost, *Erosion, Resources, *Access routes, Environmental control, Water quality, *Roads, *Subarctic, Sedimentation, *Standards, Regulation.
Identifiers: Thermal erosion.

This set of guidelines is based on Federal and State regulations that set standards to protect the total environment. Although major highway construction is under stringent regulation, pioneer type access roads such as are needed by loggers, miners, land developers, etc., have been neglected. These smaller roads frequently pose serious erosion hazards because planning, design, and construction of them is not thorough, as it is for major roads; this results in erosion, fire and insect traps, and generally unattractive roadways. Suggestions and recommendations contained in these guidelines are for the use of operators with limited engineering and planning staffs. Although all examples of poor practices are from the vicinity of Fairbanks, all suggested treatments are taken from the literature from the conterminous United States, with some modifications for subarctic conditions. Most of these recommendations are simple in concept, and if properly applied, do prevent erosion and result in superior access roads which are esthetically pleasing. (EPA)

PERCEPTION OF WATER QUALITY BY SELECT RESPONDENT GROUPINGS IN INLAND WATER-BASED RECREATIONAL ENVIRONMENTS,
Rensselaer Polytechnic Inst., Troy, N.Y. Freshwater Inst.
K. J. Kooyoomjian, and N. L. Clesceri.
Water Resources Bulletin, American Water Resources Association, Vol 10, No 4, p 728-744, August 1974. 6 fig, 5 tab, 13 ref.

Descriptors: *Trophic level, *Recreation, *Lakes, *Water quality, *Water users, *Data processing, Fishing, Eutrophication, Oligotrophy, Statistics, Water sports, Attitudes, Ecology, Sampling, Data collection, *New York.
Identifiers: Lake George(NY), Oneida Lake(NY), Saratoga Lake(NY), Schroon Lake(NY), Cluster level analysis.

Data on perceptions of water quality in oligotrophic and eutrophic lakes were obtained from a questionnaire survey of several user groups in New York state. The responses of recreationists, cottage and homeowners, and fishermen were compared utilizing percentage response profiles and cluster level groupings. The survey examined four lake environments which were paired by size and each pair contained both trophic states. The large-size pair were Lake George (oligotrophic) and Oneida Lake (eutrophic). The intermediate-size pair were Schroon Lake (oligotrophic) and Saratoga Lake (eutrophic). Partial analysis of the data indicated that the selected lakes are reasonable trophic state and points for polarizing user group attitudes toward water quality. Each user group surveyed appeared sensitive to select water quality parameters; where shifts in sensitivity appear within the between user groups with changes in ecological settings, as well as with factors independent of ecological settings. WATER RESOURCES PROTECTION MEASURES IN LAND DEVELOPMENT - A HANDBOOK,
Delaware Univ., Newark. Water Resources Center.
J. Tourbier, and R. Westmacott.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 049, $6.50 in paper copy, $2.25 in microfiche. Completion Report, April 1974. 237 p, 36 fig. OWRT C-4247(No. 9036)(1).

Descriptors: *Design criteria, *Measurement, *Protection, *Environmental control, Urban runoff, Infiltration, Erosion, Sediment yield, Flooding, Sewage disposal, Legal aspects, *Comprehensive planning, Land development, *Delaware, *Integrated control measures, Water pollution control.
Identifiers: *Christina River Basin(Del), New Castle County(Del), Urban development.

A description is presented of measures that can become in integrated part of urban development to lessen problems that would otherwise adversely affect water resources. These problems consist of runoff increases and decreases in infiltration and a greater degree of erosion and sedimentation, flooding, runoff pollution and discharge of sewage effluent. Issues have been analyzed individually in the Christina River Basin and, where possible, quantified. Measures are presented in groups and related directly to the problems listed above. Each group is preceded by a flow chart that relates individual measures to each other, and can aid in the selection of alternative techniques that follow a logical sequence. Each measure has been described, and site characteristics to which it is applicable, identified. The application, advantages and disadvantages, design criteria and outline specifications, cost guidelines and maintenance, and legal implementation of each measure are individually covered. Illustrated case studies give examples of measures which have been constructed in the field. Legal implications of implementation on the county, State and regional level are described. The State of Delaware is used as an example.

Wisconsin Water Resources Center, Madison, Technical Report 74-05. Partial Completion Report, July, 1974. 67 p, 16 fig, 43 ref. OWRT B-080-WIS(3). 14-31-0001-3948.

Descriptors: Model studies, Hydraulics, *Impoundments, *Stratified flow, *Withdrawal, *Destratification, *Water quality, Lakes, Reservoirs, Water pollution control, Forecasting.
Identifiers: *Selective withdrawal, Bottom withdrawal.

A variety of methods have been proposed to improve the water quality of lakes and reservoirs. The work described is directed toward the overall improvement of water quality in a reservoir through the removal of the poor quality, hypolimnetic water. In particular, theoretical and experimental investigations on selective withdrawal of a viscous, non-diffusive, linearly-stratified fluid from the bottom of a reservoir have been carried out. The governing differential equations which describe planner and axisymmetric withdrawal are derived. In each case, an assumed horizonatal velocity profile is substituted into the integral form of the momentum equation; the resulting ordinary differential equation is solved numerically to give the variation with distance from the outlet of the thickness of the layer of hypolimnetic water withdrawn. Using the assumed velocity profile and the principle of mass conservation, expressions are derived in each case to predict the quality of the water withdrawn. Laboratory experiments are conducted; the results obtained verify the theoretical predictions. Procedures for predicting the withdrawal layer thickness and discharged water quality in an actual reservoir are discussed.

PROCEEDINGS OF THE XV EUCEPA CONFERENCE ON HARMONIZING PULP AND PAPER INDUSTRY WITH ENVIRONMENT,
Held in Rome, Italy, May 7-11, 1973, by ATICELCA (Associazione Tecnica Italiana per la Cellulosa e la Carta), Rome, Italy, in cooperation with FAO, 1973, 806 p.

Descriptors: *Pulp and paper industry, *Pulp wastes, *Conferences, *Water pollution control, Legal aspects, Economics, Water management(Applied), Waste water(Pollution), Pollution abatement, Europe, Water supply, Industrial wastes, Treatment facilities, Water conservation, Industrial water, Air pollution, Waste water treatment, Water conservation, Water reuse, Water quality control, *Environment.

Cosponsored by FAO (Food and Agriculture Organization of the United Nations) and ATICELCA (Italian Technical Association of the Pulp and Paper Industry), this 15th annual EUCEPA (Comite Europeen de Liaison pour la Cellulose et le Papier) Conference was dedicated to environmental problems of the paper and allied industries. Numerous technical presentations dealt with technological, economic, and legislative aspects of water and air pollution control in the paper industries of various countries, not only in Europe, but also in the USSR and North America. Most of the printed contributions and their subsequent discussions from the floor are reproduced in English, a few being given in French or German. (See W74-12401 thru W74-12431) (Brown-IPC)

J. P. Gill.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 753-762, 1973.

Descriptors: *Biodegradation, *Pulp wastes, *Pollution abatement, *Pulp and paper industry, *Additives, *Chemicals, *Pesticides, Water pollution control, Industrial wastes.
Identifiers: Size-press(Paper machine), Wet-end(Paper machine), Slimicides, Retention aids, White water(Paper machine effluent), Closed systems.

Papermaking chemicals can be classified into processing aids and functional or special-purpose additives. Correct selection and controlled dosage of such compounds will achieve optimum retention or solids in the paper sheet, especially in conjunction with retention aids. Closure of the white water system of paper machines is possible by use of slimicides for control of undesirable deposits. Effluent volumes can be reduced also by applying functional additives on the size-press (that is, after the fiber web has been formed), rather than on the wet-end (that is, to the aqueous fiber suspension). Pollution problems can be minimized by development of special biocides and other compounds that are readily biodegradable. Contributions of a British chemical supplier in these areas are indicated. DEVICE FOR RECOVERING FLOATING MATTER FROM WATER SURFACE,
Bridgestone Tire Co. Ltd., Tokyo (Japan). (assignee).
K. Aramaki, H. Kawakami, and Y. Kawaguchi.
U.S. Patent No 3,812,968, 6 p, 15 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 922, No 4, p 1137, May 28, 1974.

Descriptors: *Patents, *Flotsam, *Pollution abatement, *Oil pollution, Water quality control, Water pollution control, Equipment.

The device for recovering floating matter from a water surface comprises a floating frame body, a bucket directed downward. A feeder secured to the frame body in the proximity of the bucket feeds the floating matter to an inlet opening in the bucket. The feeder consists of an endless belt which has an absorptive member secured to the outer surface. There is at least one squeezing roller engaging the endless belt. The belt moves along a closed loop extending from a point above water level to the proximity of the inlet in the bucket. A whirl-generator may be placed within the bucket. (Sinha-OEIS)
W74-12432

APPARATUS FOR CONTROLLING A POLLUTING LIQUID,
Shell Oil Co., New York.
J. P. Oxenham.
U.S. Patent No 3,810,546, 3 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 922, No 2, p 523, May 14, 1974.

Descriptors: *Patents, *Skimming, *Oil spills, *Oil pollution, *Pollution abatement, Water quality control, Water pollution control, Flotsam, Equipment, Separation techniques.

The skimmer comprises a platform having floats and rotatable drums spaced about the periphery of the platform. The drums face in mutually perpendicular directions. Each drum has a weir positioned adjacent to the interface of the liquids to allow a substantial amount of the polluting liquid to pass into the drums. Each of the drums is mounted for rotation about the axis by a suitable shaft and supports on the platform. The skimmer is arranged to remove the polluting liquid from all directions. (Sinha-OEIS)

OIL/WATER SEPARATION ACCELERATION MEDIA,
Oil Mop, Inc., New Orleans, La.
H. M. Rhodes.
U.S. Patent No 3,810,832, 2 p, 9 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 922, No 2, p 593, May 14, 1974.

Descriptors: *Patents, *Oily water, Water quality control, Waste water treatment, *Pollution abatement, Water pollution control, *Separation techniques.

The oil and water mixture is directed through a barrier of filaments of polypropylene arranged across the path of mixture. The barrier is anchored at its base at the bottom of the fluid holding pond. The free ends of the strips of polypropylene are directed upward forming an inclined plane up which the oil droplets amalgamate assisted by the buoyancy of the oil and the force flow vector of the mixture passing through the fluid holding pond. (Sinha-OEIS)
W74-12437

METHOD AND A DEVICE FOR COLLECTING SUBSTANCES FLOATING IN A LIQUID SURFACE,
H. L. Bergman.
U.S. Patent No, 3,817,385, 4 p, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 923, No 3, p 950, June 18, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Flotsam, *Pollution abatement, Water quality control, Water pollution control, Equipment, Separation techniques.

The collecting device is carried on a ship and is provided with a supply of paper rolls. The collecting device comprises a conveyor in the form of an endless band of a suitable material which is adapted to run around two spaced rollers. The conveyor band may be driven conveniently by causing one of the rollers to rotate by means of a motor. The two rollers are mutually connected to a rigid assembly by means of a frame so that one end of the conveyor can be placed in the water while the other end of the conveyer is located adjacent to a collecting table, which makes it possible to transfer the material transported by the conveyor to a collecting receptacle. At its end immersed in the water, the conveyor frame is provided with two guide plates arranged in V-form to guide floating substances on the water surface in the direction of the conveyor. (Sinha-OEIS)
W74-12446

OIL/WATER SEPARATION AND RECOVERY SYSTEM,
Pollution Recovery Systems, Okland, Calif.
J. D. Pavolvic.
U.S. Patent No. 3,815,751, 9 p, 14 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 923, No 2, p 550, June 11, 1974.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Pollution abatement, Water quality control, Water pollution control, Equipment, *Separation techniques.
Identifiers: *Oil waste recovery.

A separating tank is provided having first and second sections partially separated by a wall extending across the tank. An intake channel directs the flow of fluids downward, permitting contact between the lower density fluid flowing in the channel and a layer of the lower density fluid maintained in the tank, so as to capture the major portion of the entering lower density fluid. The higher density fluid plus entrained lower density fluid is directed downward into the second section and assumes a tortuous path over the wall into the first section, while the lower density fluid escapes upwards into the layer of the lower density fluid. The separating tank is mounted in a vessel below fluid level and the intake channel connected to a flexible articulated trough which is controlled to maintain a relatively constant level of fluid, until the fluid reaches the downward curing portion of the channel. A flexible boom is provided for containing the oil or other fluid in anticipation of or during the removal and separation operation. (Sinha-OEIS)
W74-12451

APPARATUS FOR AND METHOD OF AUTOMATICALLY REMOVING POLLUTANTS FROM A FLOWING STREAM,
Societe Alsthom, Grenoble (France).
J. L. Dubouchet.
U.S. Patent No 3,815,742, 4 p, 6 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 923, No 2, p 547, June 11, 1974.

Descriptors: *Patents, *Flotsam, *Oily wastes, Waste water treatment, Liquid wastes, *Pollution abatement, Water pollution control, Water quality control, *Separation techniques.

A separator is used so that there may be by-passed or diverted thereinto a portion of the tap of a stream on which flotsam has collected. At the downstream end of the separator, is a vertical liquid chamber. Associated with this chamber are means for permitting the discharge of separated liquid from it supper portion while maintaining the level of the liquid at a given constant above the maximum height of any interface that may exist between the liquid and pollutant material. UNRECORDED POLLUTION FROM URBAN RUNOFF,
Rutgers-The State Univ., New Brunswick, N. J., Water Resources Research Inst.
W. Whipple, J. V. Hunter, and S. L. Yu.
Journal of the Water Pollution Control Federation, Vol 46, No 5, p 873-885, May, 1974. 6 fig, 2 tab, 22 ref. OWRR A-025-NJ(5).

Descriptors: *Urban runoff, *Urban planning, *Waste disposal, *Water pollution sources, Pollution, Wastes, Streams, Biochemical oxygen demand, Planning.
Identifiers: Waste recording.

A study has been done on unrecorded pollution caused by concentrations of urban populations. It was concluded that in the case of developing urban areas when the stage of secondary treatment of recorded wastes is arrived at, the unrecorded pollution sources will account for more than half of the pollution in streams. These unrecorded wastes will be found too large to be ignored in planning. An approximation of unrecorded BOD loading of 0.02 to 0.03 lb/day/person may be used for clean residential urban development. (Murphy-FIRL)

CORPS OF ENGINEERS DREDGE AND FILL JURISDICTION: BUTTRESSING A CITADEL UNDER SIEGE,
W. C. Hoyer.
University of Florida Law Review, Vol 26, No 1, p 19-40, Fall 1973. 125 ref.

Descriptors: *Wildlife conservation, *Shorelines, *Construction, *Administration, *Regulation, Federal government, Legislation, Tidal wetlands, Aquatic habitats, Water resources development, Recreation, Institutional constraints, Administrative agencies, Political aspects, Adoption of practices, Aesthetics, Ecology, Coastlines, Legal aspects, Planning, Waste water pollution, Water law.
Identifiers: *Coastal waters, *Fill permits, *Administrative regulations.

Coastal and estuarine wetlands are vital to the survival of fish and wildlife. They also have a function in controlling floods and tidal forces. All of the nation's shorelines are facing pollution or development. Uncontrolled and unplanned dredging and filling of these areas have resulted in a depletion of aquatic resources. Unspoiled beach and shore areas available for public use are becoming scarce. The United States Army Corps of Engineers has major statutory responsibility for most of these shorelands. Work in waterways where the Corps has jurisdiction is subject to Corps approval. The Corps thus plays a role requiring significant environmental responsibility. Being a developer, itself, the Corps has not traditionally been oriented toward resource conservation. The Corps is not presently administratively organized to evaluate ecological factors fairly. The Corps is being impaled by environmentalists for its lack of aggressiveness, at the same time being criticised by developers for lack of clarity and consistency. The basis for Corps of Engineers jurisdiction over dredge and fill projects is examined, and the expansion of that jurisdiction into the environmental arena is traced. (Sperling-Florida)

AIR POLLUTION FROM FUEL COMBUSTION IN STATIONARY SOURCES.
Processes Research, Inc., Research Triangle Park, N.C. Industrial Planning and Research.
Available from NTIS, Springfield, Va 22161 as PB-222 341, Price $4.25 printed copy; $2.25 microfiche. Final Report EPA R2-73-241, on U S National Report to OECD Joint Group on Air Pollution from Fuel Combustion in Stationary Sources, October 1972. 109 p.

Descriptors: *Air pollution, *Sulfur, *Nitrogen, Dusts, *Pollution abatement, Sampling, Planning, *Oxides.
Identifiers: Air pollution control, Combustion.

Estimates are given of past and future fuel consumption in stationary combustion sources and of the associated quantities of the air pollutants-sulfur oxides, nitrogen oxides, and particulate-emitted to the atmosphere from the combustion of these fuels. Abatement strategies to control the 1980 level of pollutant emissions are proposed. The projected emissions of sulfur and nitrogen oxides could be expected to approximately double the 1968 levels of pollution without implementation of new controls. Those of particulate emissions are expected to increase some tenfold without the best control practices. The 1980 emissions can be controlled to the targeted levels through implementation of control and fuels management practices. The estimated costs for achieving control approach a total estimated capital expenditure of about $13 billion (cumulative through 1980) and an annual operating cost climbing to $2.8 billion in 1980 (1970 dollar estimates). (Knapp-USGS)
W74-12640

EVALUATION OF CONCEPTS FOR SEPARATING OIL FROM WATER DISCHARGED FROM SHIPS,
Coast Guard, Washington, D.C. Office of Research and Development.
W. C. McKay.
Available from NTIS, Springfield, Va. 22161 as AD-770 346, Price $4.25 printed copy, $2.25 microfiche. Technical Report, August 1973. 117 p, 9 ref.

Descriptors: *Oily water, *Ships, *Water pollution control, *Separation techniques, Waste water treatment, Pollution abatement.

Methods for separating oil from water discharged from ships were tested. The eight systems evaluated are: tubular membrane separator, centrifugal coalescer separator, laminar flow coalescing plate separator, ultrafiltration separator, electrochemical flotation separator, vacuum desorption air flotation separation, viscosity separation, and vortex separation. It is essential that oil-water mixtures be emulsified as little as possible prior to separation. Emulsification of the mixture can be reduced by the elimination of detergent cleaning agents, by the de-rating of centrifugal pumps to 50% of the designed rpm, and when practical, locating the pump after the separator. Ultrafiltration systems and the electroflotation systems consistently produced high quality effluent discharges with less than 10 parts per million of oil. Centrifugal systems are most suited for high volume ballast water cleaning systems because of their small size and high flow capability. Laminar-flow, parallel-plate separators offer possibilities for separating oil from ballast water when the oil-water mixture is not emulsified. Cartridge coalescers can meet effluent discharge standards, when operated to prevent ingestion of detergents and to reduce mechanical mixing of the influent. (Knapp-USGS)

ASSESSMENT OF BIODEGRADATION POTENTIAL FOR CONTROLLING OIL SPILLS ON THE HIGH SEAS,
Oklahoma State Univ., Stillwater. Dept. of Biochemistry.
R. K. Gholson, P. Guire, and J. Friede.
Available from NTIS, Springfield, Va. 22161 as AD-759 848, Price $5.45 printed copy, $2.25 microfiche. Contract Report for US Coast Guard, September 1972. 130 p, 19 fig, 4 tab, 203 ref. DOT-CG Contract 20, 260-A.

Descriptors: *Oil spills, *Oily water, *Biodegradation, *Water pollution control, Water pollution treatment, Aquatic microorganisms, Reviews, Research and development.

Research work related to the problem of the biodegradation of marine oil spills was reviewed to determine the practical feasibility of controlling oil spills and residues by biodegradation and to define those areas requiring additional research and development. There are several means by which crude oil and refined petroleum products may be introduced into the marine environment. First, there are shipping disasters, of which the Torrey Canyon and the Tampico Maru are recent notable examples. A second kind of accident which can result in large quantities of crude oil being released into the sea is an uncontrolled seep occurring when a new oil well is being sunk on the Continental Shelf. However, a greater total amount of oil pollution may result from deliberate release of many small quantities of oil onto the sea by tankers and other cargo vessels. Also, the loading and unloading of oil cargo constitutes a hazard in harbors and ports. Oil pollution of the ocean also occurs from runoff by way of rivers and sewage systems. Many natural oil seeps on the ocean floor constitute another continuous source of petroleum entering the marine environment. Natural processes cause the oil to disappear. These processes include disposal by evaporation, emulsification, sinking and beaching of the oil components and destruction by oxidation and by microbial degradation. Microbial oxidation of the oil is the main reason that the oceans and beaches of the world are not completely covered with petroleum hydrocarbons. Hydrocarbon oxidation has been observed in a wide variety of both terrestrial and marine microorganisms including many species of bacteria and several species of yeast and fungi. (Knapp-USGS)

WATER QUALITY CRITERIA 1972, A REPORT OF THE COMMITTEE ON WATER QUALITY CRITERIA.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 199, $2.25 in microfiche. Environmental Protection Agency, Ecological Research Series, March 1972. 594 p, 3 append. EPA-R3-73.033.

Descriptors: *Water quality standards, *Reviews, *Regulation, *Baseline studies, Basic data collections, Recreation, Aesthetics, Water supply, Aquatic life, Wildlife, Irrigation water, Industrial water, Freshwater fish, Marine animals, Marine fish, *Toxicity, *Lethal limit, *Toxins, Bibliographies.

In 1971, at the request of the Environmental Protection Agency, the National Academy of Sciences-National Academy of Engineering undertook the revision of WATER QUALITY CRITERIA, the 1968 Report of the National Technical Advisory Committee (NTAC) to the Secretary of the Interior. The Academies appointed a Committee on Water Quality Criteria and six Panels, and the responsibility for overseeing their activities was assigned to the Environmental Studies Board, a joint body of the Academies. The guidelines for the Academies' Committee were-similar to those followed by the NTAC. The Committee's six Panels were: (1) Recreation and Aesthetics, (2) Public Water Supplies, (3) Freshwater Aquatic Life and Wildlife, (4) Marine Aquatic Life and Wildlife, (5) Agricultural Uses of Water, and (6) Industrial Water Supplies. In the 1972 Report many new subjects are discussed in detail, among them: the recreational impact of boating, levels of use, disease vectors, nuisance organisms, and aquatic vascular plants; viruses in relation to public water supplies; effects of total dissolved gases on aquatic life; guidelines for toxicological research on pesticides and uses of toxicants in fisheries management; disposal of solid wastes in the ocean; use of waste water for irrigation; and industrial water treatment processes and resultant wastes. Many toxic or potentially toxic substances not considered by the NTAC are discussed including polychlorinated biphenyls, phthalate esters, nitrilotriacetate (NTA), numerous metals, and chlorine. The six Sections do not provide summaries; an understanding of how the recommendations should be interpreted and used can be gained only by a thorough reading of the rationale and the evaluation of criteria preceding the recommendations. (See also W74-12675)

RESEARCH NEEDS IN WATER QUALITY CRITERIA, 1972.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.
Available from Environmental Studies Board, National Academy of Sciences, 2101 Constitution AV, NW, Washington, DC 20418. NAS-NAE Report, Washington, DC, 1973. 64 p, 1 fig, 3 tab, 79 ref.

Descriptors: *Research priorities, *Water quality standards, *Reviews, *Regulation, *Baseline studies, Basic data collections, Recreation, Aesthetics, Water supply, Aquatic life, Wildlife, Irrigation water, Industrial water, Freshwater fish, Marine animals, Marine fish, *Toxicity, *Lethal limit, *Toxins, Bibliographies.

In conjunction with the primary task of revising and updating Water Quality Criteria, the NAS-NAE Committee on Water Quality Criteria compiled research needs as limitations to establishing criteria were encountered because of a lack of scientific information. The present document reports on those needs and is intended to serve as a guide to scientists, research program managers, and institutions involved in fostering scientific information relating to water quality requirements for the various uses made of the nation's waters. Because the report is based largely on the Committee's initial report, Water Quality Criteria, 1972, it should be used in conjunction with it, as the rationale for most of the research needs reported here is found there. This report is crossreferenced by page numbers to appropriate sections of Water Quality Criteria, 1972. (See also W74-12674)

CONTROL OF CATCH-BASIN MOSQUITOES USING ZOECON ZR515 FORMULATED IN A SLOW RELEASE POLYMER: A PRELIMINARY REPORT,
California Univ., Davis. Dept. of Entomology.
R. L. Dunn, and F. E. Strong.
Mosq News. Vol 33, No 1, p 110-111. 1973.

Descriptors: *Mosquitoes, Polymers, Toxicity, *Pesticide toxicity.
Identifiers: Hormones, *Zoecon(ZR-515), Juvenile hormones, Catch-basin mosquitoes, Slow-release polymers.

The potential effectiveness of a slow-release polymer-juvenile hormone (JH) system was demonstrated on a catch-basin study. The slow-release polymers overcame a previously described problem a short residual toxicity. Now, catch basins treated early in the breeding season may result in effective control for the entire season with a single application of a JH-slow release polymer.--Copyright 1974, Biological Abstracts, Inc.

THE LACK OF INORGANIC REMOVAL OF DISSOLVED SILICA DURING RIVER-OCEAN MIXING,
University of South Florida, St. Petersburg. Marine Science Inst.
K. A. Fanning, and M. E. Q. Pilson.
Geochim Cosmochim Acta. Vol 37, No 11, p 2405-2415, 1973.

Descriptors: *Rivers, *Estuaries, *Sediments, Oceans, Interfaces, *Saline water-freshwater interfaces, *Inorganic compounds, *Silica, Flumes, *Fluvial sediments, Suspended solids, *Sediment transport, Water pollution control.
Identifiers: Orinoco, Venezuela, Savannah River, Mississippi River, Plumes.

The significance of the inorganic removal of dissolved silica from estuarine zones was investigated at 3 river mouths: the Orinoco (Venezuela), the Savannah and the Mississippi. Particular attention was given to the Mississippi river plume, where extensive inorganic silica uptake had been reported. Mixing curves and laboratory dilution experiments provided little evidence that the phenomenon was widespread,. Because of an uncertain fresh water tie point, some inorganic uptake could not be completely ruled out for the Orinoco, but, in the plumes of the Savannah and Mississippi rivers, no inorganic silica removal was indicated. In contrast to published experiments on river sediments, laboratory dilution studies on suspended matter from the Mississippi river showed release of dissolved silica instead of uptake.--Copyright 1974, Biological Abstracts, Inc.

EPIDEMIOLOGICAL ASPECTS OF THE PROBLEM OF SANITARY PROTECTION OF BODIES OF WATER, (IN RUSSIAN),
D. P. Nikitin.
Gig Sanit. Vol 37, No 12, p 61-63. 1972.

Descriptors: *Public health, *Diseases, Epidemiology, Environmental sanitation, Sanitary engineering, *Water supply, Infection, Protection.

A major role should be played by scientists and practical workers of the sanitary and epidemiological services in solving problems related with the use of funds allocated for environmental protection, particularly protection of bodies of water. In so doing they should concentrate on routine sanitary inspection. The successful implementation of measures to protect water will be a major contribution to the solution of the general problem of the prevention of intestinal infections in the country.--Copyright 1973, Biological Abstracts, Inc.

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

COMPUTER USES IN WATER SYSTEMS: CONFERENCE REPORT.
Water Research Association, Marlow (England).
A Water Research Association Conference, University of Reading, England, 25-27 September 1973. 53 p, 15 fig, 6 ref, 1 append.

Descriptors: *Conferences, Computers, *Water resources development, *Information retrieval, *Water pollution control, *Data storage and retrieval.

The Water Research Association Conference of September 1973 dealt with the use of computers in the management, analysis, planning and design of water resource systems. A broad range of topics in both the water and computing fields were covered, and numerous data processing, simulation and optimization techniques were presented together with computer programs and models. Contained within this Conference Report are: STORET, the Environmental Protection Agency's computerized information system for defining cause and effect relations in water pollution; a summary of the discussions which took place during the Conference sessions, motivated by the invited Conference papers; the closing address; and an appendix comprised of the names and associations of the delegates attending the Conference. (See W74-12108 thru W74-12147) (Bell-Cornell)

STORET-THE EPA WATER QUALITY DATA SYSTEM,
Environmental Protection Agency, Washington, D.C.
C. S. Conger.
In: Computer Uses in Water Systems: Conference Report. A Water Research Association Conference, University of Reading, England, p 1-20, 25-27 September 1973. 15 fig.

Descriptors: Computers, *Information retrieval, *Water pollution control, *Data storage and retrieval.

STORET is the Environmental Protection Agency's computerized information system serving over two hundred remote locations. The system attempts to define the cause and effect relationships in water pollution. Described are the system and the form of the data identifiers. The system is based on two files: the water quality file and the General Point Source File. The methods of addressing the data base are outlined and examples of various retrievals are given. The paper concludes with a brief indication of proposed future developments. (See W74-12107) (Bell-Cornell)

COMPUTER USES IN WATER SYSTEMS: CONFERENCE PAPERS.
Water Research Association, Marlow, (England).
A Water Research Association Conference, University of Reading, England, 25-27 September 1973. 308 p, 57 fig, 15 tab, 41 equ, 160 ref.

Descriptors: Computers, *Water resources, *Management, *Systems analysis, Data processing, Simulation analysis, Optimization, Computer models, Computer programs, Economics, Forecasting, Planning, Hydrology, River basins, Reservoirs, Lakes, Telemetry, Water treatment, Water quality control, Water supply, Water distribution(Applied), Mathematical models, Industries.
Identifiers: Regional water authorities, *United Kingdom.

This volume contains sixteen conference papers which deal with the use of computers in the management, planning, and analysis of water resource systems. These articles cover a broad range of topics in both the water and computing fields. Numerous simulation, optimization, and data processing techniques are presented. Included are such subjects as computer based management systems, management information in the water industry, computer and systems analysis applications to water resource planning, water quality monitoring, computer investigations of lake water movements, remote control of a water system using an on-line mini computer, computers in structural design, a process/financial computer modeling. These sixteen articles represent a comprehensive overview of the role being played by computers within the water industry, primarily in Great Britain. (See W74-12107) (Bell-Cornell)
W74-12109

COMPUTER BASED MANAGEMENT SYSTEMS--OPPORTUNITIES IN THE NEW ORGANIZATION,
R. M. B. Kenyon.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 1-10, 25-27 September 1973.

Descriptors: *Organizations, Computers, *Management, *Benefits, Water resources, Planning, Methodology, Economics, Regional development, *Regional analysis.
Identifiers: *Regional Water Authorities, Data.

The formation of new, larger organizations presents numerous opportunities to obtain benefits from the use of computer based management systems. These systems will have an impact upon all aspects of the new organization, for example, in resource planning, quality control, distribution, and design, as well as providing scope for benefits in other areas such as administration, accounting, and financial planning. Considered is the introduction of computer based management systems in the new Regional Water Authorities. Discussed are the opportunities for benefits or improvements which are available and how new systems should be developed to achieve the goals and to avoid pitfalls and consequent disappointments. Application of computer systems in specific areas is not dealt with here. Description is given of the main features of computer based management systems; this is then linked to the sections on opportunities by examining briefly the relevant aspects of the new authorities. Finally, the problems of development are discussed and a planning method is recommended. Successful changeover to computer based management systems necessitates hard work and careful planning, the main steps being: (1) audit present position and establish future needs; (2) simulate means of satisfying needs; and (3) prepare blueprint for implementation. PROCESS/FINANCIAL MODELS,
J. N. Firth, and A. M. Sutton.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 29-39, September 1973. 3 fig.

Descriptors: *Mathematical models, *Computer models, Computer programs, Industries, Control, Planning, Economics, Evaluation, Estimating, Systems analysis.
Identifiers: *Financial models, Process evaluation, Comprehensive modeling.

The concepts of mathematical model building are introduced and extended to include financial computer models. The general nature of these models and their use are investigated. Financial models are a sub-set of mathematical models, expressing relationships in monetary terms. Developed is a unique extension of financial models to include physical aspects, process yields, etc. In its most complex form a financial model is a complete control and planning system based on computer models. The four types of these are: those run in batch or time sharing, and those constructed using a financial language or a multi-purpose language such a FORTRAN. Two specific models, representing the extremes of financial model building, are discussed in detail. The first, a simple budget model built in a financial language, SIMSTRAT, calculates the gross profit and percentage increase in gross profit over the first period. The second is a generalized process model written in FORTRAN. This model, used extensively in London and Mexico, is designed to evaluate chemical and steel plants and other production systems. Considered are the possible applications of these techniques within the water industry. (See also W74-12007) (Bell-Cornell)
W74-12112

AN INTEGRATED MODEL FOR THE PLANNING AND OPERATION OF WATER SYSTEMS,
Water Research Association, Marlow, (England). Economics Group.
T. Wyatt.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, 25-27 September 1973, p 41-71. 29 p, 5 fig, 4 tab, 24 ref.

Descriptors: *Water resources development, *Planning, *Analytical techniques, *Multiple-purpose, *Operation and maintenance, Mathematical models, Costs, Resource allocation, Time, Water distribution(Applied), Networks, Design, Water storage, Water demand, Simulation analysis, Optimization, Systems analysis, Comprehensive planning, Regional analysis.
Identifiers: Cost minimization.

Analytical techniques have been developed in various problem areas of the water resources field. A brief review is made of three such areas: (1) water resource systems incorporating long-term storage for planning and operation, herein considering simulation and optimization techniques; (2) resource allocation to multiple demand areas, discussing allocation subject to short-term constraints and nonlinear power tariffs; and (3) water distribution systems, considering least-cost design of distribution networks. These are defined in terms of objectives, constraints, and the decision time span involved. The degree of interaction between these sub-areas is discussed and ways in which such dependence might be accomodated in light of present expertise are considered. In-

creased regionalization, conjunctive and multi-purpose use promote this interaction between problem areas which must be modeled for global system optimization. Mathematical models should be developed within the overall framework of a total integrated water system model with due consideration of the financial links involved in the management process. (See also W74-12107) (Bell-Cornell)
W74-12113

SYSTEMS AND TECHNIQUES FOR RESOURCE PLANNING,
Water Resources Board, Reading (England).
V. K. Collinge.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, p 73-103, 25-27 September 1973. 7 fig, 8 ref.

Descriptors: *Water resources, *Regional analysis, *Analytical techniques, *Comprehensive planning, Data processing, Hydrologic data, River flow, Resource allocation, Economics, Investment, Timing, Simulation analysis, Groundwater, Multiple-purpose reservoirs, Control, Mathematical models, Systems analysis.
Identifiers: England, National planning, Mixed integer programming.

The development background of computer-based techniques to aid regional and national planning of water resources is outlined. Examined in detail are the main features of these types of analyses. The development of a system for processing and archiving river flow data is described. Planning techniques evolved by the Board are then described; future data needs and the tasks facing the new Data Collection Unit are indicated. Resource planning techniques and objectives, with respect to allocation and costing, are described and illustrated through reference to the Trent Economic Model. Description of the Model includes that of the river, the allocation, and the timing of investment models, together with the way in which these models interact. Finally, examples of planning and operational models are given in three appendices. The first of these deals with a simulation technique for evaluation of a regional water resource system, the second with the South Downs groundwater model, and the third with short-term control strategy for multi-purpose reservoir systems. SYSTEMS ANALYSIS IN WATER RESOURCE PLANNING IN THE USA,
Geological Survey, Washington, D.C. Water Resources Div.
E. D. Attanasi.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, p 105-127, September 1973. 2 tab, 61 ref.

Descriptors: *Water resources, *Planning, *Systems analysis, *Analytical techniques, *Surveys, Computers, Evaluation, Value, Comprehensive planning, *United States, Optimization, Simulation analysis, Mathematical models, Economics, Hydrology, Forecasting.

A heuristically-based survey of computer and systems analysis applications to water resource planning is presented. Systems techniques are considered in terms of their application to the establishment of economic, social, physical and hydrologic relationships, to forecasting values of planning variables, and to evaluating, via simulation or optimization, alternative policies in terms of system performance. Specific techniques are reviewed briefly. A general appraisal of methods of construction and 'validation' of systems models is made. Presented is a tabular survey of special applications of computer modeling and optimization techniques; selected hydrologic, physical, economic and social modeling efforts and alternative optimization and decision models are reviewed. An assessment is made of the impact of computer and systems analysis applications to water resource planning. A summary of previous criticism is also presented. The concluding discussion suggests how these methodological issues may dictate the direction of future research. (See also W74-12107) (Bell-Cornell)

USE OF COMPUTERS BY THE CONSULTING ENGINEER IN THE DEVELOPMENT OF WATER RESOURCES,
W. Pemberton.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 283-294, 25-27 September 1973. 1 ref, 2 append.

Descriptors: *Water resources development, Computers, *Environmental engineering, *Computer programs, *Hydrologic data, Benefits, Planning, Data processing, Hydraulics, Simulation analysis.

Discussed is the use of computers by consulting engineers in the water resources field; considered is the effect of this use upon their organization and management systems. The obvious and secondary benefits of computer use are mentioned. The use of computers to rationalize documentation and in the digital simulation of water resource systems is discussed. The possible future development of GENESYS sub-systems to cover water resources problems is considered; an outline of a possible, simple sub-system for processing hydrological data is given. Until a short while ago, the characteristics of computers were restrictive in applications to water problems; particular difficulties were experienced with delays in communicating with the computers. Recent developments however, especially in data transmission, have removed many of these difficulties and now enable the economic provision of computing services and of computer-based information services to dispersed organizations, such as the new Regional Water Authorities (RWA's). This paper discusses how current developments in computing services can help serve the re-organizing water industry in England. Considered are mini-computers, terminals, the commercial scene, databases and database management systems, software packages, technical systems, and computer selection. The author envisages the day when each RWA will have a centralized large computer on which will be based not only the 'classic' computer applications of accounting, payroll and project control, but also information services for strategic planning and day-to-day control and technical services for engineers and planners. COMPUTER USES IN WATER SYSTEMS: CONTRIBUTED PAPERS.
Water Research Association, Marlow (England).
A Water Research Association Conference, University of Reading, England, 25-27 September 1973. 110 p, 38 fig, 3 tab, 29 equ, 27 ref.

Descriptors: Computers, *Water resources development, *Systems analysis, Management, Simulation analysis, Optimization, *Computer programs, *Computer models, Data processing, Planning, Design, Hydrology, Water pollution control, Water distribution(Applied), Networks, Reservoirs, Rivers, Lake Erie, Economics, Water chemistry, Finite element analysis, Dynamic programming.
Identifiers: River authorities, *United Kingdom.

This is a supplement to the volume which contains invited Water Research Association Conference papers. Comprised herein, however, are 22 short articles which were contributed to the Conference. They deal with the use of computers in the management, analysis, planning and design of water resource systems and cover a broad range of topics in both the water and computing fields. Numerous data processing, simulation and optimization techniques are presented together with computer programs and models. Included is the use of computers in such areas as integrated hydrometric data processing by a river authority, public health engineering, reservoir scheme yield assessment, river regulation scheme design, time-sharing for water resources planning, wind driven circulation in shallow lakes, prediction of ammoniacal nitrogen, analysis and design of water distribution

systems, the start-up model of a rapid sand filter, and the development of a national library of GENESYS programs. These 22 articles represent a comprehensive overview of the role being played by computers within the water industry, primarily in Great Britain, and are a rich supplement to the volume containing invited Conference papers. TECHNICAL COMPUTER SYSTEMS,
Mersey and Weaver River Authority (England).
D. Sherlock, and E. Tongue.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 5-9, 25-27 September 1973.

Descriptors: Computers, Analysis, *River basin commissions, Hydrometry, Management, Reservoirs, Conjunctive use, Rainfall, Computer programs, Backwater, Curves, Frequency analysis, Information retrieval.
Identifiers: Technical problems, Conveyance curves, Information, Abstraction licenses, *United Kingdom.

Discussed is the development of the application of computer systems to technical problems by the Mersey and Weaver River Authority. Following the Authority's inception, the basic information relating to abstraction licenses was put on computer file. The range of analyses of hydrometric data was extended and programs were developed for use in hydraulic design calculations. An ICL 1901A computer comprises the central processor; magnetic tapes have recently been added. The range of technical applications in use at present is outlined, including: backwater and conveyance curves; surveying; river flow analysis; rainfall analysis; frequency analysis; state-discharge calculations; experimental catchment; reservoir and conjunctive-use programs; and abstraction licence analyses. The last two applications are discussed in more detail. Described is a minimum ranking program developed for use either in reservoir design or in conjunctive use schemes; the program calculates from main daily flows and limitations on abstractions, such as prescribed flows, etc., the quantity of water which may be abstracted during each day. The licence file has been expanded and is designed to contain information required for a variety of purposes by different departments of the Authority. It is now a management system rather than a simple technical application. (See also W74-12107) (Bell-Cornell)

THE USE OF A COMMERCIAL TIME-SHARING COMPUTER FOR WATER RESOURCE PLANNING,
Severn River Authority (England).
T. Kitson.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 35-38, 25-27 September 1973. 1 fig.

Descriptors: Computers, *Data processing, *Water resources, *Planning, Computer models, *Computer programs, Data collections, Projects, Reservoir operation, Simulation analysis, River regulation, River flow, Costs, Systems analysis.
Identifiers: Time-sharing computers, Batch facilities, Commercial bureaus, Predicting.

This brief paper describes the use by the Servern River Authority of a commercial bureau which offers batch, time-sharing, and remote job entry facilities. A number of sub-systems are used to insure mixed mode operation of the three facilities. Two examples of the type of water resource planning projects undertaken are discussed: reservoir simulation studies and river regulation studies. The costs of using the facilities are considered. It is concluded that a commercial bureau provides planners with a sophisticated computer installation which is almost continuously available without the commitment to expensive equipment, specialist personnel or office equipment. A. C. Tory.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 52-55, 25-27 September 1973. 5 fig.

Descriptors: *Computer models, *Computer programs, *Digital computers, *Water resources, Hydrologic data, Engineering, Systems anslysis.
Identifiers: Model building, Operating rules.

A computer package, designed to enable the water resources engineer to produce a reliable model with the minimum of programming effort, is described. In constructing a model, the physical system must be expressed operationally; a system diagram and a data file are shown. The heart of the model is contained within the function FLOW; the sources of hydrological data are specified within the function HYDRO. Limitations and future developments of the package are discussed. (See also W74-12107) (Bell-Cornell)

DEVELOPING A NATIONAL LIBRARY OF PROGRAMS USING GENESYS,
Loughborough Univ. of Technology (England). Genesys Centre.
R. J. Allwood.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 105-110, 25-27 September 1973. 1 fig, 2 ref.

Descriptors: Computers, *Computer programs, Engineering, *Libraries.

In the utilization of computers for engineering, the similar problems which must be faced by both programmers and users are discussed. For example, many programs will work only on the computer used for the initial development, and often can be understood of used only by the original author. This is tolerable with small programs; but with progress in electronics, more sophisticated and larger programs are being developed. It then follows to ask whether the programming tools of the 60's are suitable for developing such complex, substantial programs. The creation of GENESYS and the establishment of the Genesys Centre provide solutions to these problems. The advantages of this program and Centre for both user and programmer are discussed in detail. GENESYS uses a machine-independent language which is easily translatable into a version of FORTRAN suitable for the particular computer being used. The library of engineering programs needs only to be written once and is available on many types and sizes of computer, at many computing centres throughout the country. The Genesys Centre acts as the focal point for the development and supply of programs. To promote use of GENESYS, the Centre: (1) maintains and distributes programs; (2) provides publicity and education; and (3) develops a library. GENESYS is a commercial venture. WEBER RIVER BASIN INCLUDING DAVIS COUNTY AND THE OGDEN S.M.S.A.: WATER QUALITY MANAGEMENT PLANNING, PHASE I--PROGRAM DESIGN.
Stevens, Thompson and Runyan, Inc., Portland, Oreg. and Nielsen, Maxwell and Wangsgard, Inc., Salt Lake City, Utah.
Utah State Division of Health, Salt Lake City, February 1973. 57 p, 4 fig, 3 tab.

Descriptors: *Planning, *Regional analysis, *River basin development, *Utah, *Watershed management, *Water quality control, River basins, Water Quality Act, Federal Water Pollution Control Act, Cities, Long-term planning, Project planning, Studies.
Identifiers: *Weber River Basin, Area-wide planning, Metropolitan planning.

A program design is presented for water quality planning in the entire Weber River Basin, including both metropolitan areas and non-metropolitan areas within Weber County and Davis County, Utah. The metropolitan areas includes portions of the Ogden and Salt Lake City Standard Metropolitan Statistical Areas. This first phase study is an attempt to define the program clearly. Phase I consists of the following elements: physical description of the planning area, goals and objectives, statement of problem, status of basin planning, and a description of the water quality planning program. The latter is subdivided into program management, program design, planning coordination, funding and budget. Brief descriptions of individual tasks comprising the planning program are provided in the Program Design section. A task numbering system has been adopted to follow the logic of the planning process. The nine major tasks suggested are: (1) program definition and design, (2) program management, (3) community involvement and information, (4) data system, (5) system requirements, (6) synthesis of alternative systems, (7) analysis of alternative systems, (8) evaluation of alternative systems and selection of a preferred system, and (9) implementation plan. Phase II of the program will provide budget cost estimates and recommendations for finalizing of funding and assignments of tasks. Phase III will be development of the water quality management plan for the Weber River Basin. Phase IV will be development of the metropolitan water quality management plans for the Ogden SMSA and Davis County. (Poertner)

CHATTANOOGA AREA REGIONAL COUNCIL OF GOVERNMENTS COMPREHENSIVE WATER AND SEWER STUDY: HAMILTON, WALKER AND CATOOSA COUNTIES, BOOK TWO.
Hensley-Schmidt, Inc., Chattanooga, Tenn.
Chattanooga Area Regional Council of Governments, Chattanooga, Tennessee, December 1971. 192 p, 39 fig, 9 tab. Tennessee P-131.

Descriptors: *Planning, *Water supply development, *Sewerage, *Regional analysis, *Georgia, *Tennessee, Waste water treatment, Long-term planning, Municipal water, Municipal wastes, Urbanization, Comprehensive planning.
Identifiers: *Chattanooga(Tennessee).

A comprehensive regional water supply and sewerage plan was developed for a three-county area surrounding Chattanooga, Tennessee. The study area included Walker and Catoosa Counties in Georgia and Hamilton County, Tennessee. Efforts to expand opportunities and solve problems within the region are underway through a comprehensive planning program which includes regional studies of housing, land use, transportation, parks, recreation, open space, solid waste disposal, water and sewerage. In recent years, many local governments have initiated independent studies and developmental programs to meet the water and sewerage needs of their citizens. However, to date no study has been made of the entire area with a view toward coordinating and meeting both present and future needs. Because water and sewerage systems are closely related to the topographic features of an area, rather than political boundaries, it is important to consider providing these services on a regional basis if the most beneficial and compatible land use and water resources conservation are to be attained. Based on findings, specific recommendations deal with the development of a comprehensive plan for water and sewerage facilities for the three-county area. (Poertner)

A Q-METHODOLOGICAL STUDY OF ATTITUDES TOWARD WATER RESOURCES AND IMPLICATIONS FOR USING MASS MEDIA IN DISSEMINATION OF WATER RESEARCH RESULTS,
Missouri Univ., Columbia. Water Resources Research Center.
R. R. Kahle, and R. L. Lee.
Available from the National Technical Information Service as PB-235 859 $8.00 in paper copy, $2.25 in microfiche. Partial Completion Report, (1974). 349p, 5 fig, 23 tab, 160 ref, 8 append. OWRT X-127(3756)(1).

Descriptors: *Attitudes, *Communication, *Information exchange, *Social aspects, *Public opinion, *Publications, Psychological aspects, Motivation, Human behavior, Rural sociology, Social sciences, Questionnaires, Applied psychology, Public relations, Behavior, Social behavior, Editing, Reviews, Television, *Missouri, Films, Correlation analysis.
Identifiers: *Q-Methodology study, Radio, Newspapers, *Mass communication, *Dissemination of information, *Factor analysis, Religion, Abduction, Depth interviews, Beliefs, Extension service, News media, Attitude scaling, Psychometrics.

To analyze audience attitudes, a Q-study of attitudes toward water resources in Missouri was undertaken. Four basic attitude types were isolated: 'Ecologically Aware,' 'Farmers' Advocates,' 'Rural Optimists,' and 'Optimistic

Professionals.' The study further showed how this attitude information could be applied to designing a dissemination of information program utilizing the mass media, with special attention to radio and newspapers. Among the demographic variables that were found most pertinent to water resources attitude patterns were relious affiliation, age, and residence (urban, town, or rural). A replication of Costantini and Hanf's Environmental Awareness Scale failed to be internally reliable when transplanted to Missouri. However, the four basic attitude patterns closely resemble the four lemma clusters described by Courtland Smith in an Oregon study.

ESTIMATING RESERVOIR RECREATIONAL VISTS IN INDIANA,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
K. K. Wolka, and G. H. Toebes.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 818, $4.50 in paper copy, $2.25 in microfiche. Technical Progress Report No 48, June 1974, 99 p, 8 tab, 24 fig, 21 ref, 5 append. OWRT-A-026-IND(3).

Descriptors: *Recreation, *Access routes, *Lakes, *Multiple purpose projects, *Reservoir operations, Water sports, Swimming, Boating, Recreation demand, Reservoirs, Transportation, Statistical models, Correlation analysis, *Indiana, *Estimating.
Identifiers: *Population centers, *Origin-Destination models, Recreation Standard models, Network models, Forecasting models, Causal models.

A prediction model was developed to estimate the expected number of recreational vists to Federal reservoirs in Indiana. To this end an elementary origin-destination model was amended in several ways. The ultimate purpose in constructing the simulation model was its possible use for evaluation purposes of benefits from different types of water resources development. The two main project benefits are flood control and recreation. An evaluation of the recreation benefits requires an estimate of the expected future visitation based on Indiana data. This estimation method is the subject of the report. The method is an improvement over existing models in that a network approach was followed. Further work is needed to adjust the model. The absence of some constraints for the selection of which data are not yet available, caused several unacceptable prediction results. (See also W74-12197)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 819, $4.00 in paper copy, $2.25 in microfiche. Technical Report 27, (1974). 81 p, 6 tab, append. OWRT A-008-MD(1), 14-01-0001-790.

Descriptors: *Recreation, *Recreation demand, *State parks, *Recreation facilities, Planning, Attitudes, Social aspects.

The distance of a recreation facility from potential users does exert an important influence on the intensity of use which a facility receives. The exact nature of this influence varies somewhat depending on the nature of the creation area, but is in all cases the dominant influence. With no information other than the distance of recreation area from blocks of potential users, a fairly reliable estimate of the relative intensity of use can be derived. Some information concerning the type and quality of the recreation area under consideration is necessary if these attendance-distance relationships are to be used for predictive purposes. Further studies with different types of recreation areas should help define more precisely differences in the attendance-distance relationship with differing kinds of recreation are as. Quality and uniqueness of the recreation area are important factors to consider when looking at the attendance-distance relationship. It is desireable to locate many types of recreation facilities where they will be accessible to large numbers of people. Most large metropolitan areas are in need of more easily accessible recreation. Recreation planners and other resource planners must keep in mind the importance of accessibility when considering resource investments which have recreational potential. If accessibility is not given major attention in the planning process, the result will be a smaller return on resource investments than would otherwise be possible.

Identifiers: Urban growth, Resistance to urban growth, Community goals, Latent shortage.

Three instruments were designed and implemented to measure the effectiveness of water as a resource to control urban growth. The instruments were applied in varying degrees to forty urban communities whose water supply was unable or has been exactly able to keep up with the demand for water. The data was then used as an input for the development of a procedure for multiple objectives planning, which has utility in the evaluation of any specific water development project involving opposing attitudes toward growth in the affected urban communities.

PRIMARY DATA ON ECONOMIC ACTIVITY AND WATER USE IN PROTOTYPE OIL SHALE DEVELOPMENT AREAS OF COLORADO: AN INITIAL INQUIRY,
Colorado State Univ., Fort Collins. Dept. of Economics.
S. L. Gray.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 039, $3.00 in paper copy, $2.25 in microfiche. Colorado Environmental Resources Center, Fort Collins, Completion Report No 58, June 1974. 8 p. OWRT A-024-COLO(1). 14-01-0001-4006.

Descriptors: *Colorado, *Water utilization, Oil shales, Economics, *Community development, *Economic prediction, *Income distribution.
Identifiers: *Oil shale development, Economic structure.

Potential impacts of oil shale development on the economies of certain Western Slope communities in Colorado are quite large. These impacts will likely exert a substantial pressure on the land and water resource lease of the area in addition to the effects upon community development, regional income, income distribution, and a changing mix of business activity. In order to approach future research on these issues this 'seed' research effort was designed to (1) promote interaction and interchange of ideas among researchers and members of the affected communities, (2) to identify important areas of research needs in the oil shale region, and (3) to initialize the collection of primary data depicting the economic structure of the oil shale communities.

DETERMINATION ON NEVADA'S ATTITUDE TOWARD WATER RESOURCES RESEARCH,
Nevada Univ., Reno. Desert Research Inst.
R. M. Whitacre.
Completion Report, August 1974, 5 p. OWRT A-041-NEV(1). 14-31-0001-3228.

Descriptors: *Attitudes, *Information exchange, *Communication, *Research priorities, *Project planning, *Nevada.
Identifiers: Information dissemination, Research results, Advisory groups, Research planning.

One of the major problems confronting a research center is the dissemination of information to the people of the area as to how the research results can be of value to the community. The primary objective of this particular study was to identify needs and priorities of water resources research in Nevada, to recommend programs and guidelines to meet those needs and the ultimate dissemination of these findings by the Center for Water Resources Research, Reno, Nevada. It was found that a concerted effort must be made to determine the local research needs and the delivery of the research results. Also, that all information should be prepared both for technical use and use by the avefage citizen. Finally, a statewide group of interested organizations and officials should be formed to advise the Center as to the water resouce needs and problems in Nevada. (Fallon-Nevada)

THE CONCEPT OF CARRYING CAPACITY,
Utah State Univ., Logan. Dept. of Civil and Environmental Engineering.
A. B. Bishop, R. Toth, A. B. Crawford, and H. H. Fullerton.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. V:24-V:37. 1974. 3 fig, 2 ref.

Descriptors: *Carrying capacity, *Environmental control, *Environmental effects, *Resources, *Resources development, Resource allocation, Costs, Economics, Social aspects, Regional development, Spatial distribution, Urbanization, Constraints, Limiting factors, Benefits, Costs.
Identifiers: Regional growth, Urban regions, Growth limitations.

Carrying capacity is the level of a certain activity that can be sustained in a given environment. Recent rapid rise of concern for environmental problems has revealed that levels of particular activities (e.g. automobile transportation, sewage disposal) in many urban areas have already exceeded carrying capacities with dire results. The concept of carrying capacity must be included in planning regional development. Determinants of carrying must be considered. First, resources of the environment should be cataloged: ambient resources (airsheds, watersheds, sunlight); spatial resources (underground, surface and air); infrastructure and distributive resources (utilities, transportation); ecological resources (plants, animals); sociocultural resources; economic resources (labor, capital, raw materials); and amenity resources (seashores, open space). The desired information about each resource should include the quality and quantity, renewability, spatial distribution, and economic and social costs. Linkages between the urban environment and the region, e.g. linkages of transportation and water and energy distribution, are the second determinant, and life styles and social values of the individuals and institutions, the third. Application of carrying capacity must consider both the stability and resiliency of the system as it moves toward the equilibrium state, the factor which limits resource use or growth, and the factor which might trigger an unplanned and undesired chain of events in the ecological or urban system. THE STRATEGIC ENVIRONMENTAL ASSESSMENT SYSTEM (SEAS): A RESEARCH PROJECT,
Environmental Protection Agency, Washington, D.C.
S. M. Greenfield.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. VI:26-VI:31. 1974.

Descriptors: *Assessments, *Computer models, *Cost-benefit analysis, Environmental effects, Decision making, Optimization, Pollution effects, Planning, Long term planning, Regional analysis, Research and development, Analytical techniques.
Identifiers: Strategic Environmental Assessment System(SEAS).

Predicting long range environmental effects of different societal options is one of the most important challenges facing the environmental field. Benefits from such forecasting include a systematic organization of the many criteria, social, economic, and environmental, that determine the effectiveness of different environmental strategies. Another benefit is the assistance that could be given to environmental managers in providing comprehensiveness, and following the progress of certain programs in achieving stated goals. Midcourse correction could be applied more easily by testing a set of alternative goal policies. The Strategic Environmental Assessment System model will have these important and new characteristics: (1) deal explicitly with pollution generators, possible controls, and known effects of residuals; (2) be a national level model system; (3) have a 10 to 20 year time horizon; (4) make use of official environmental, economic and demographic data; (5) be used together with expert opinion; and (6) project the state of the environment and socioeconomic systems. A text model of the system will be completed in December and will be used to prepare a '1980 State of the Environment' projection. Initially SEAS will be used to assess different policy options, integrating the computer's capabilities and human expert opinion, and to establish research goals. Ultimately it would aid in policy formulation and in following the progress of the Nation. (See also W74-12457) (LaPointe-North Carolina)

COMMUNICATIONS IN ENVIRONMENTAL MANAGEMENT,
Metropolitan Regional Council, Inc., New York.
R. T. Davis.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. VI:35-VI:39. 1974.

Descriptors: *Information exchange, *Environmental management, *Communication, *Regional development, *Decision making, Planning, Frequency, Transmission, Networks, Timing, Costs, Administrative agencies, Local governments.
Identifiers: *Television, Communication system, Microwave transmission, World Trade Center, New York City(NY).

Microwave television transmission offers the capability of more efficiently linking together decisionmakers of regional governments. In September, 1970, the Metropolitan Regional Council of New York City established a microwave type of closed circuit system using the World Trade

Center as a central point (a tall building or mountain being needed to establish an unobstructed path between points), connected with 17 points in the metropolitan area. The system, which allows live, two way, bi-directional discussion, is now almost completed and may be extended to branch offices, police stations and hospitals, and coordinated with a cable television system. Present strategy is to employ the system to allow decision-makers more real communication time to monitor specific progress and specific projects. However, local governments are reluctant to buy a system over which they exercise no control, a period of time is required for users to adapt themselves to bi-directional television, utility of such a system must be clearly demonstrated to local governments. A number of problems have arisen including a lack of understanding on how to best use the system, inadequate financing techniques, reluctance of designers to work with small, incrementally increasing systems instead of large systems, and the tendency of the hardware to sometimes impede the discussion. However, such systems will increase comprehensiveness and cohesion so that systematic decisions can be made. (See also W74-12457) (LaPointe-North Carolina)
W74-12474

MANAGING AT THE LOCAL LEVEL,
International City Management Association, Washington, D.C.
M. E. Keane.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. VII:40-VII:42. 1974.

Descriptors: *Local government, *Conferences, *Decision making, *Community development, *Environment, Communications, Pollution, Governmental interrelations, State governments, Information exchange, Political aspects, Standards, Planning, Comprehensive planning.
Identifiers: Conference summarization.

The need for strong local government in the environmental movement should be emphasized and discussed: (1) The environmental movement embraces a wide variety of individuals. Conferences are essential for communication. (2) The mass media must be educated to the issues and utilized more effectively than current crisis reporting. (3) Quality of life should be monitored at some base line level so as to include those who have been excluded from society's affluence. (4) We must realize that the politician will make the ultimate decisions, and must develop an understanding of political pressures which burden him. (5) Adaptation to the environment occurs at the local level. Effective community action depends upon a national foundation of basic law, commitment and resources. (6) Traditional programs should invite local initiatives. (7) Environmental managers must adapt themselves to the incremental nature and slower pace of local decisionmaking, due to the proximity of the citizenry to local officials. (8) Local level expertise must be developed to enable local political leaders to better understand and analyze environmental issues. (9) Technology needed by local governments differs from that used by universities and industry. More organizations must be created to furnish the needed technology. (10) Citizen involvement is vital. Strategies must be developed to efficiently incorporate the citizenry in decision-making. (See also W74-12457) (LaPointe-North Carolina)

Descriptors: *Public utilities, *Marginal costs, Wells, Municipal water, Pricing, Water costs, *Water uses, Model studies, Interest, Bond issues, Investment.
Identifiers: *Urban development.

The objcetive was to determine if the water payments by the new users are sufficient to pay for the operation and maintenance costs as well as costs associated with developing a new well field. A model was developed to simulate future system growth. This model generated estimates of the amount of new users' payments available each year to pay for the construction of the new wells. Comparing these estimates to the principal and interest payments on the bond issue which financed the well construction gave an indication of whether or not new users paid for the new wells. Also, information was developed on the reated question of extent to which various types of new users pay for the new wells.

LAND POTENTIALS: FORSYTH COUNTY PHYSIOGRAPHY.
City-County Planning Board, Winston-Salem, N.C.
City-County Planning Board, Winston-Salem, North Carolina, December 1968. 48 p, 12 fig, 7 tab, 43 ref, 4 append.

Descriptors: *Geomorphology, *Land classification, *Data collections, *Regional analysis, *North Carolina, Climatic data, Soil types, Soil surveys, Urbanization, Groundwater, Regional development, Comprehensive planning.
Identifiers: *Forsyth County(North Carolina), *Winston-Salem(North Carolina).

The physiography of Forsyth County, North Carolina, was studied as part of a larger study to be used for the development of a comprehensive plan for the area. Forsyth County is located in the Northwestern portion of North Carolina. It is a predominately rural county, but it is becoming urbanized. The population in 1968 was about 227,600 and the rural portion was estimated at 39,200. The altitude of Forsyth County ranges between 800 and 1,000 feet. The area is well drained, and lies on the Piedmont of the Blue Ridge Mountains and Great Smoky Mountains. Freezing temperatures occur for about 3 months, and temperatures exceed 89 degrees for about 1.5 months per year. Precipitation averages 44.5 inches annually, with a fairly constant amount received throughout the year. Soil types are generally favorable for urban development, although some limitations do exist. Where not suited for urban development, soils are suitable for use for recreational uses, forestry and agriculture. The geologic base of the area provides essential minerals, including sand, gravel, clay and ground water. Ground water quality is generally acceptable; contamination has thus far been only an isolated problem and hardness and iron content are only rarely troublesome. (Poertner)

SOME EXTENSION SERVICE CAPABILITIES,
Georgia Univ., Athens. Cooperative Extension Service.
C. P. Ellington.
In: Proceedings of the Joint Conference on Recycling Municipal Sludges and Effluents on Land, July 9-13, 1973, Champaign, Illinois, The National Association of State Universities and Land-Grant Colleges, Washington, D.C., p 213-214, 1973.

Descriptors: *Research, *Education, *Information exchange, *Local governments, *Water resources, *Recycling, *Municipal wastes, Agriculture.
Identifiers: Community support, County leadership.

The Cooperative Extension Service, created by Congress in 1914, has the ongoing function of providing information from research of the Agricultural Experiment Stations. The present role of this service is to work through county leadership towards changes at local levels. Community support is necessary for any modification of water resources use. Recycling of municipal sludges is one specific area in which education and information should be disseminated to the public. (Prague-FIRL)

INFORMAL OPINIONS,
Food and Drug Administration, Washington, D.C.
C. Jelinek.
In: Proceedings of the Joint Conference on Recycling Municipal Sludges and Effluents on Land, July 9-13, 1973, Champaign, Illinois, The National Association of State Universities and Land-Grant Colleges, Washington, D.C., p 215-217, 1973.

Descriptors: *Food, *Fertilizers, *Toxicity, *Contamination, *Heavy metals, Pesticides, Crops, Mercury, Lead, Cadmium, Zinc, Organic chemicals measurement, Polychlorinated biphenyls.

The Bureau of Foods within the Food and Drug Administration asks that caution be used in the application of sludge or effluents as fertilizers. Levels of toxicity are very vague, including contamination by heavy metals such as mercury, lead, cadmium, arsenic, selenium, and zinc. Organic chemicals such as pesticides, PCB's, are also included. Recommended are monitoring operations for food crops and animal feed crops. For example, a test might be set up using both a control and a commercial fertilizer, measuring for pesticides, pathogenic organisms, and heavy metals. (Prague-FIRL)

WATER SUPPLY AND WATER POLLUTION CONTROL CAPITAL PROGRAM 1972-1985.
Delaware Valley Regional Planning Commission, Philadelphia, Pa.
(1972), 92 p, 14 fig, 15 tab. HUD Grant.

Descriptors: *Planning, *Water pollution control, *Water supply, *Delaware River Basin Commission, *Capital costs, *Regional analysis, *Delaware River, Budgeting, Financing, Water resources development, River basins, Valleys, Project planning, Delaware, Construction costs, Scheduling, Long-term planning.
Identifiers: *Capital program, Development program.

The Water Supply and Water Pollution Control Capital Program 1972-1985 is the official, Board approved, companion working document of the 1985 Regional Water Supply and Water Pollution Control Plan. This 1972 Capital Program constitutes a major development in Water Supply and Water Pollution Control Capital Programming in the Delaware Valley Region. For the first time, the long range development of water and sewer facilities has been scheduled for the region on an annual cost basis. This approach, therefore, establishes a significant change in format from that of the preliminary document produced in 1969. The program presents two major scheduling periods. The first is from 1972 to 1977, by individual year; the second aggregates the period 1978 to 1985. The program favorably reflects all decisions of the Delaware Valley Regional Planning Commission (DVRPC), since 1969. Projects which have been implemented to data have been deleted. Consequently, such changes represent almost a complete turnover of capital projects since 1969 for many counties. A comprehensive study was designed by the DVRPC staff which would provide for a uniform methodology of analysis and application to all projects in the region. In using this approach, scheduling allocations could then be best determined on the basis of regional and environmental needs rather than on political boundaries or influences. Under this method, political areas would not be measured against each other and long range projections would thus be made on the basis of watershed needs. (Poertner)

LEGAL PROBLEMS IN WATER POLLUTION CONTROL,
New York State Dept. of Environmental Conservation, Albany.
D. F. Metzler.
Preprint No 1891, American Society of Civil Engineers, National Water Resources Engineering Meeting, Washington, D.C. January 29-February 2, 1973. 15 p.

Descriptors: *Water pollution control, *Legal aspects, *New York, Administration, Legislation, Law enforcement, Equity, Permits, Penalties(Legal), Pollution abatement, Water quality, Water quality control.

New York State has an agressive and increasingly effective water pollution control program. This program has led to $3.1 billion of work completed or underway since 1966 and is expected to result in another $2.5 billion of work to be started in the next 5 years. The experiences gained in this program should be of assistance in the formulation of water pollution control programs by other states and the federal government. Three eras of water pollution control can be described: (1) the initial period, when control was practically non-existent; (2) a period of increased activity in which waters were surveyed and classified and cooperative approaches were used to abate pollution; and (3) the present intense program, highly dependent on legal action against pollutors. As a result of New York State programs, 6 general conclusions were reached: (1) water quality standards provide a sound basis for pollution abatement programs, maintained by limits on specific discharges, (2) water quality regulations should be a part of an overall environmental protection program; (3) enforcement should aim at a strengthening regional solutions; (4) water pollution laws should be expanded and interpreted by a board or commission formed from all parts of society; (5) a well-managed permit system is essential and needs to be supported by a monitoring system; and (6) nonpoint sources of pollution will require new methods of control, including land-use regulations. Technische Universitaet, Darmstadt (West Germany). Wassert und Abwasserforschungsstelle.
W. Brecht.
In: Proceedings XV EUCEPA Conference on Harmonizing Pulp and Paper Industry with Environment; held in Rome, May 7 to 11, 1973, p 59-62, 1973.

Descriptors: Europe, *Legislation, *Pollution abatement, *Environmental control, *Pulp and paper industry, Water consumption(Except consumptive use), *Waste water(Pollution), Economics, *Financing, Research and development, Project planning, Potable water, Legal aspects, Regulation, Industrial water, Biological treatment.
Identifiers: *West Germany(German Federal Republic).

Water demands in West Germany presently total about 16 billion cu m per year, of which about 72% is industrial and 14% each is trade and domestic usage. The pulp and paper industry stands in 4th place among all 45 industrial water users, with an annual demand of 930,000,000 cu m in 1969. West German legislative measures provide for both short- and long-term environmental protection, such as extensions of the Water Conservation Law in force since March 1, 1960, notably enforcement and pollution penalty provisions enacted Feb. 28, 1973. A 1985 deadline requires biological clarifier installations for 85% of the total pollution. Potable water demand is expected to double by the year 2000, requiring considerable local, regional, and federal financing to treat about 50% of all industrial effluents which are still being discharged into receiving waters. The seriousness with which these problems are being approached is evident from various research and project programs mentioned. (See also W74-12400) (Brown-IPC)

Descriptors: *Legislation, Europe, *Environmental control, *Pollution abatement, *Water pollution control, Legal aspects, Pulp and paper industry, Governments, Regulation, River basin commissions, Regional development, Planning, Projections, Project planning.
Identifiers: *France.

The historical development of French legislative measures against water and air pollution is traced from its beginnings in 1810 to the most recent decree of March 27, 1973. Emphasis in the French approach to ecology problems is on regional authorities in charge of managing various natural river basins. Several time-planned stages in antipollution measures have met with encouraging results. Thus, the 5th 5-year plan (1964-1969) achieved a 10% overall reduction in territorial pollution. The 6th plan (1971-1975) aims at a 20% reduction. (See also W74-12400) (Brown-IPC)

ENFORCING ENVIRONMENTAL LAW IN THE CITY,
New York City Corporation Counsel.
N. Redlich.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. V:59-V:61. 1974.

Descriptors: *Law enforcement, *Legal aspects, *Legal review, *Regulation, *Environmental control, Local governments, Pollution abatement, Standards, Permits, Administrative agencies, Urbanization, *New York.
Identifiers: Enforcement, Environmental law, *New York City(NY).

For environmental laws to be efficiently enforced in an urban setting there must be a restructuring of city agencies and traditional enforcement techniques must give way to new more easily administered methods. In New York the many departments which addressed environmental problem areas, for example the Sanitation Dept., the Dept. of Water Resources, etc., have merged into the Environmental Protection Administration, which has the ability to weigh the total effect of a particular decision. Representatives from this agency also sit on interdepartmental commissions, and can bring to these commissions a broad scale and expertise in many subcategories of environmental knowledge. Traditional enforcement techniques are totally unsuitable for an urban setting. Imposition of standards on the polluting devices (incinerators, noise generators, and fuel burning equipment) have been more effective for the City of New York. Permits to operate such devices are now required, providing greater control by the enforcing agency which also has the power to test devices to determine if they meet proper standards. A nine man environmental control board has been created to remove pollution test cases from already overcrowded court calendars. This board has the power of review, may issue cease and desist orders, permit relocation, and impose civil penalties of up to $100/day. However these fines must still be enforced in court. Citizen enforcement has also been developed. If no action is forthcoming from the agency, after a complaint is filled, the citizen may take the complaint to court and receive a share of any fines the court might order the offender to remit. (See also W74-12457) (LaPointe-North Carolina)
W74-12471

STATE RESPONSIBILITY IN MANAGING THE ENVIRONMENT,
Connecticut Dept. of Environmental Protection, Hartford.
D. W. Lufkin.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. VII:10-VII:12. 1974.

Descriptors: *State governments, *Environmental management, *Connecticut, Standards, Solid waste, Electric power production, Fuels, Electric power cost, Wildlife habitats, Legal aspects, Legislation, Economic feasibility.
Identifiers: Department of Environmental Protection(Conn).

The philosophy of the new federalism is to leave to the states the enforcement at the regional level of environmental standards set by the federal government. The federal government should set objectives, support state governments both technically and financially, and enforce only when the state government is not carrying out its responsibilities. In Connecticut the Department of Environmental Protection was established under Act 872 by uniting under one department those environmental responsibilities previously scattered among many state agencies, among them air, water, pesticides, radiation and all state natural resources for recreation. With the General Electric Company a solid waste program was established setting up 23 watersheds, separation and reuse of noncombustible materials, and disposal of combustible materials, all at a cost of $10 per ton. A solid waste authority was created with a bonding capability of $250 million. The main difficulty is the lack of administrative enforcement options, now limited to drawn out court proceedings. A recent registration program for the 16,000 point sources of air pollu-

tion resulted in 25% noncompliance, and it is infeasible to bring the 4000 non-compliers to court. However, legislation will soon be passed which gives administrators a fining capability. Fines will be levied by estimating the difference between costs of non-compliance (legal fees, operating costs saved, capital use saved) with that of compliance (equipment costs, opportunity costs, operation costs), and will be discounted over time. Such a running fine should be an incentive for compliance and should eliminate all but the most meritorious suits. (See also W74-12457) (LaPointe-North Carolina)
W74-12475

HOW A REGIONAL ORGANIZATION ASSUMES ENVIRONMENTAL RESPONSIBILITY,
Metropolitan Council of the Twin Cities Area, Minn.
F. T. Lamm.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. VII:13-VII:18. 1974.

Descriptors: *Regional development, *Environmental management, *Local government, Political aspects, Air pollution, Solid waste, Water pollution, Recreation, Budgeting, Land use, Legislation, Planning, Federal Water Pollution Control Act.
Identifiers: Twin Cities Area Metropolitan Council.

Many issues of environmental impact must be handled on the regional level. However due to the relative newness of regional government, regional organizations must take bold affirmative steps in assuming their responsibilities and establishing their authorities. Designation by HUD as the area-wide planning organization with appropriate certifications and as a regional clearinghouse under Bureau of the Budget Circular A-95 are important indications of environmental responsibility. Some methods for assuming environmental reaponsibilities for air quality, solid waste management, water resources, water pollution, recreation and protection of open spaces as handled by the Twin Cities Area Metropolitan Council are discussed briefly. The state is primarily responsible for air quality. The Minnesota Pollution Control Agency is able to delegate many powers to regional implementation organizations for cooperative development of a state-wide implementation plan for air quality. The Metropolitan Council has developed a coordinated program with the state for solid waste management. Funding is available from EPA for regional water resource planning, and further funds should become available under sections of the Federal Water Pollution Control Act. Water resource planning offers an excellent opportunity for regional agencies to provide an important service for local governments. In the Twin Cities area, the different watershed districts are submitting their Overall Plans to the Metropolitan Council for review and approval. Local governments are reluctant to consider open space protection in zoning and land use policies. Efforts have been confined to persuasion and the creation of an Open Space Advisory Board. OIL, GAS, AND WATER LAW--TODAY AND TOMORROW,
Gee and Hearon, Austin, Tex.
J. C. Dougherty.
In: Oil and Water--A Symposium, Bureau of Economic Geology, Texas University, Austin, January 29, 1965. p 56-64, (1965). 19 ref.

Descriptors: *Legal aspects, Laws, Statutes, Ordinances, *Groundwater, Recycling, Judicial decisions, Water law, Economics, Legislation, Project planning, Public health.
Identifiers: Pooling, Slant holes, *Legal tomorrows, Railroad commission, Supreme Court, Texas water commission, Pollution control board, Federal Water Resources Act of 1964.

The concept is discussed of 'legal tomorrows'--or steps that may be taken soon in oil, gas, and water law by courts, administrative agencies, and legislative bodies. The first 'legal tomorrow' is compulsory pooling of interests in order to give each land tract owner his fair share of recoverable production, while at the same time efficiently managing production from a reservoir. The legislative history of pooling is outlined and a proposed pooling bill is listed. The second 'legal tomorrow' concerns jurisdiction over salt water disposal; recent legislation and court cases are cited. The third 'legal tomorrow' is in the developing guidelines for Commission regulation of the slant hole problem where directional surveys disclose greater than permissible vertical deviation. The Supreme Court has denied to the Railroad Commission power to devise and assess penalties of its own making not specifically authorized by statute. An effort to coordinate the work of the Texas Water Commission, the Texas Water Development Board, and the Texas Water Pollution Control Board and to integrate them into a long-range State Water Plan is described. OIL AND GAS VERSUS WATER IN THE SOUTHWEST: CONFLICT OR COMPROMISE,
Humble Oil and Refining Co., Corpus Christi, Tex.
R. E. Faggioli.
In: Oil and Water--A Symposium, Bureau of Economic Geology, Texas University, Austin, January 29, 1965. p 7-20 (1965).

Descriptors: *Legal aspects, *Groundwater, Conservation, Laws, Ordinances, Statutes, Economics, Public health, Industries, Potable water, Aquifers, Saline water, *Oil industry, *Southwest US, *Texas.

The transition from a pre-1930 agrarian economy in Texas to current water needs for irrigation, municipal, and industrial purposes has been accompanied by legislative action directed toward conservation of this important natural resource. Numerous federal and state agencies are interested in Texas water, but the four principal organizations for state-wide water jurisdiction are: Texas Water Commission, Texas Railroad Commission, Water Pollution Control Board, and Texas Water Development Board. The competition for subsurface water use resolves itself into two principal problem areas: depletion of ground water and pollution of ground water. The major part of the salt water produced in Texas was being injected as far back as 1961. Continued progress, including additional secondary recovery projects, has been accomplished since that time. Additional background in the geology of ground water should be considered on an academic level and in industry application. Prepared with a factual background a geologist can make himself aggressively available to industry organizations which work closely with governmental agencies having responsibilities related to water resources. As a result, the geologist should be in a position to give aid toward leading the conflict in water demands through compromise to compatibility. (Campbell-NWWA)

MOHAWK UTILITIES, INC. V. PUBLIC UTILITIES COMM. (APPEAL FROM PUBLIC UTILITIES COMMISSION ORDER).
307 N.E.2d 261 (Ohio 1974).

Descriptors: *Ohio, *Judicial decisions, *Public utility districts, *Water contracts, *Water allocation(Policy), Water distribution(Applied), Regulation, Legal review, Water law, Jurisdiction, Water policy, Water rights, State governments, Public utilities, Legal aspects, Contracts, Land tenure, Water districts.
Identifiers: Water rights(Non-riparian).

Plaintiff utility company appealed in order of the defendant regulatory commission directing the plaintiff to cease collecting water-availability charges. The sale contracts and warranty deeds for all lots sold in the Lake Mohawk subdivision contained provisions for water-use and water-availability charges. Each lot was assessed a fixed water-availability charge until the owner hooked up to the water system, at which time the charge became a fixed water-use charge in the same amount. Owners who had more than one lot were assessed the charge on each lot owned. On complaint of land owners the defendant ruled that the charge was unreasonable and unlawful and ordered it discontinued. This action followed. The Ohio Supreme Court upheld the plaintiff's contention that the commission's ruling was based on an erroneous interpretation of an earlier Ohio Supreme Court decision, but denied plaintiff's contention that the commission had no jurisdiction over the plaintiff's rates. Reversing the order of the commission, the court ruled that a restrictive covenant in a contract for sale of land assessing a water-availability charge is not per se contrary to law. (Deckert-Florida)
W74-12602

CONTROLLING ACTIVITIES OF COASTAL WETLANDS.
N.C. Gen. Stat., sec. 113-230 (1971).

Descriptors: *Wetlands, *North Carolina, *Shore protection, *Coastlines, *Coastal engineering, Coasts, Structures, Regulation, Decision-making, Legislation, State governments, Legal aspects, Wildlife conservation, Administrative agencies, Aesthetics, Public health, Safety, Commercial fishing, Coastal marshes, Eminent domain, Penalties(Legal), Marshes.
Identifiers: *Administrative regulations, *Coastal waters.

The Director of the North Carolina Department of Conservation and Development, in order to promote the public safety and health, and to protect wildlife and marine fisheries, is permitted to promulgate regulations concerning the altering of coastal wetlands. Before adopting or repealing any regulation there must be a public hearing in the county where the coastal wetlands are located. Notice must be given to any owner or claimed owner of such wetlands as well as to interest state agencies. Any order will be recorded with the register of deeds in the county where the land is located. A violation of any regulation will constitute a misdemeanor. Any person possessing an affected interest in the land may petition the superior court to determine whether the order so restricts the use of his property as to constitute a taking without compensation. If such a taking is found to have occurred, the order will be of no force, and the state will then be required to institute eminent domain proceedings. (Sperling-Florida)
W74-12603

WATER POLLUTION POLICY.
N.Y. Environmental Conservation Law, secs. 17-0101 thru 17-0105 (1972).

Descriptors: *Water pollution, *Water quality, *Water pollution control, *Water policy, *Water pollution treatment, New York, Legislation, Administration, Water conservation, Environmental sanitation, Waste disposal, Water pollution sources, Waste water treatment, Water supply, Water law, Water quality standards, Public health.

Water pollution control and its effects on fish, wildlife, industrial use and public health and enjoyment are considered. The purpose is to prevent any new pollution and abating existing pollution, thereby safeguarding the waters of the state of New York, under a program consistent with the declaration of policy. Definitions are set forth to be used in reference to the titles of the statute. Definitions are included for the terms persons, waters, marine district, sewage, standards, sewer systems, treatment works, outlets and shellfish. (Sutton-Florida)
W74-12604

DEPOSITING TRASH, GARBAGE, ETC., ON LANDS OF ANOTHER OR IN WATERS OF THE STATE.
N.C. Gen. Stat., secs. 14-134.1 (1965).

Descriptors: *North Carolina, *Water pollution sources, *Legislation, *Garbage dumps, Sanitary engineering, Regulation, State governments, Legal aspects, Municipal government, Water conservation, Watershed protection, Land management, Permits, Landfills, Administration.

It is unlawful for any person, firm or municipal organization to place or leave any trash or waste materials upon the lands of another without the written consent of the owner. Whether the materials are deposited there permanently or temporarily is immaterial. It is also unlawful, unless specifically authorized by law, to place or deposit, temporarily or permanently, any such waste materials in any waters within the state of North Carolina, including any waters over which the state has jurisdiction. It shall not be unlawful to deposit such waste materials in a public dump maintained by a municipality or county. A violation of this statute is a misdemeanor punishable by a fine of not more than $500.00 or imprisonment of not more than six months. (Sperling-Florida)
W74-12605

WATER AND WATER SUPPLY POLLUTION.
N.J. Stat. Ann., ch. 26:3B-4 (Supp. 1973), as amended, ch. 32, sec. 1 (1973) Laws of New Jersey.

Descriptors: *New Jersey, *Legislation, *Public health, *Waste water(Pollution), *Water pollution control, Water pollution sources, State governments, Regulation, Safety, Water supply, Water conservation, Industrial wastes, Municipal wastes, Sewage effluents, Discharge(Water), Waste water disposal, Farm wastes, Bodies of water, Wildlife conservation, Aesthetics, Social aspects, Water quality, Water pollution treatment.
Identifiers: Hazardous substances(Pollution).

Any person, corporation, or municipality is prohibited from depositing, accumulating, or providing storage facilities for certain delineated substances. Such substances include: human excrement; decomposable animal or vegetable matter; domestic, factory, workshop, mill or slaughterhouse refuse; and sink, laundry, milk, creamery, or cheese house waste. These and any other polluting matter are prohibited if dealt with as to gain access to any well, spring, stream, or any body of water, including oceans and estuaries. The prohibition applies only if the disposal causes or threatens injury to any person in health, comfort or property, or if the pollution causes or threatens degradation of water quality resulting in damage to the aquatic community or wildlife in and adjacent to the affected water body. (Sperling-Florida)
W74-12606

LOWRY V. NORRIS LAKE SHORES DEVELOPMENT CORP. (ACTION BY LANDOWNERS TO ENJOIN DEVELOPMENT CORPORATION FROM REQUIRING PURCHASE OF METERS AS CONDITION TO CONTINUING WATER SERVICE).
203 S.E.2d 169 (Ga. 1974).

Descriptors: *Georgia, *Judicial decisions, *Water contracts, *Legal aspects, *Water law, Land tenure, Water rights, Equity, Water distribution(Applied), Domestic water, Water conservation, Water allocation(Policy), Water policy, Water management(Applied), Water supply, Water supply development.
Identifiers: *Estopple, *Evidence, *Injunctive relief, *Water rights(Non-riparian).

Plaintiff lot owners brought suit against the defendant development company to enjoin defendant from requiring plaintiffs to purchase water meters as a condition to continued water service. The defendant had been furnishing water at a fixed rate, but wished to install water meters, charge a fee for the meters, and charge for water use. The plaintiffs argued that the defendant was contractually obligated under the plaintiffs' deeds to furnish water at a fixed rate of $10 per quarter. They also argued that statements made by salesmen at the time plaintiffs purchased their lots, equitably estopped the defendant from refusing to sell water to the plaintiffs at $10 per quarter. The trail court granted summary judgment for the defendant and plaintiffs appealed. The Supreme Court of Georgia affirmed, ruling that there was nothing contained in the deed which obligated the defendant to furnish water, and mere evidence that the defendant instructed its salesmen to sell prospective buyers that water would be provided for a given flat fee, did not create an equitable estoppel or contractual obligation to furnish water at the initial rate. (Deckert-Florida)
W74-12607

POTOMAC VALLEY CONSERVANCY DISTRICT.
Committee on Public Works, (U.S. House).
H.R. Rep. No. 1405, 91st Cong, 2nd Sess (1970). 18 p.

Descriptors: *Interstate compact, *River basin commissions, *Legislation, *Federal government, *Water pollution control, State governments, Budget, Administration, Government finance, Coordination, Natural resources, Conservation, Land resources, Delaware, Water resources development, Water resources, Water law, Economic aspects, Public health, Water treatment, Administrative agencies.
Identifiers: Congressional hearings.

A report is presented on congressional hearings on amendments to the compact creating the Potomac Valley Conservancy District and establishing the Interstate Commission on the Potomac River Basin. The purpose of the legislation is to broaden the authority of the Commission to include management of water resources and associated land resources. Its present authority is restricted to water pollution abatement. The Commission is to provide a liason between public and non-public agencies in the formulation and coordination of plans and programs for the protection and development of water and land resources. A provision in the original compact was deleted which limited the total contributions of the signatories to less than $30,000 annually. A proposed federal interstate compact, which is modeled after the existing Delaware River Basin Compact is presently under review. In view of increasing costs the Commission will have to retrench its presently restricted activities unless there is prompt action to remove the ceiling upon contributions. (Sperling-Florida)
W74-12608

AUTHORIZING THE SECRETARY OF THE INTERIOR TO CONSTRUCT, OPERATE, AND MAINTAIN THE NARROWS UNIT, MISSOURI RIVER BASIN PROJECT, COLORADO, AND FOR OTHER PURPOSES.
Committee on Interior and Insular Affairs (U.S. House).
H.R. Rep. No. 1132, 91st Cong, 2nd Sess (1970). 13 p.

Descriptors: *Cost-benefit analysis, *Legislation, *Flood protection, *Irrigation, *Multiple purpose project, Administration, Federal government, Administrative agencies, Government finance, *Colorado, Project planning, River basin, Water resources development, Water requirements, Water allocation(Policy), Groundwater resources, Recreation, Wildlife conservation, Hydroelectric powerplants, Aquifers, Confined water, Boating, Economic aspects, Fishing.
Identifiers: Congressional hearings.

A report is presented on a bill, favoring recommendation, to authorize the Secretary of the Interior to construct, operate, and maintain the Narrows unit in the Missouri River Basin project in Colorado. The Narrows unit was included in the general comprehensive plan of the Missouri River Basin project authorized by the Flood Control Act of 1944. The Narrows unit is a multiple purpose project that will provide maximum feasible utilization of the surface water resources of the area. It will provide supplemental irrigation supplies to 166,370 acres of presently irrigated land. It will also protect the South Platte River Basin from floods originating upstream. Outdoor recreational opportunities will be significantly increased. More wildlife habitat will be created in the plains region and hydroelectric power will be produced. Groundwater use in the past has depleted the aquifer supplies. At present surface flows and aquifers are not sufficient for efficient irrigation. The estimated cost of the unit as of 1969 was $68,050,000. (Sperling-Florida)
W74-12609

WATER BANK ACT--REPORT.
Committee on Agriculture and Forestry (U.S. Senate).
Sen. Rep. No. 1393, 91st Cong, 2nd Sess (1970). 8 p.

Descriptors: *Administrative agencies, *Supervisory control(Power), *Waterfowl, *Nests, *Migratory birds, Wetlands, Conservation, Agriculture, Water conservation, Water resouces, Reclamation law, Water rights, Projects, Water law, Decision making, Environmental effects, Costs, Natural resources, Marshes, Water resources development, Water management(Applied), Adoption of practices, Administration, Water policy, Ponds, Lakes.
Identifiers: *Coastal zone management.

The Secretary of Agriculture is authorized to enter into 10 year renewable contracts with landowners and operators of migratory waterfowl nesting and breeding areas for the conservation of water on specified wetlands. During the period of the contract, the landowners agree not to drain, burn, till, or otherwise destroy the wetland areas and not to use such areas for agricultural purposes, as determined by the Secretary. In return for the agreement, the Secretary of Agriculture makes payments to the owner or operator. The rate of annual payments is determined by the Secretary and may be increased if the owner or operator agrees to permit, without other compensation, access by the general public for hunting, trapping, fishing, and hiking. The bill also authorizes the Secretary to share the cost of establishing and maintaining conservation and development practices on the wetlands and adjacent areas. The bill requires the Secretary to carry out its provisions in harmony with wetlands programs administered by the Secretary of the Interior and to utilize the technical and related services of appropriate state, federal, and private conservation agencies to insure proper coordination. (Kelly-Florida)

OCEAN DUMPING CONVENTION IMPLEMENTATION.
Committee on Merchant Marine and Fisheries (U.S. House).
H.R. Rep. No. 568, 93rd Cong, 1st Sess (1973). 17 p.

Descriptors: *International commissions, *Legislation, *Waste disposal, *Navigation, *Water pollution control, Water pollution, Oceans, Federal jurisdiction, Federal government, International law, International waters, Foreign waters, Domestic waters, Administrative agencies, Ships, Adoption of practices, Navigable waters, Oil, Water law, Water policy, Legal aspects.
Identifiers: Coastal waters, Congressional hearings.

The Committee on Merchant Marine and Fisheries of the U.S. House of Representatives amended the Marine, Protection, Research and Sanctuaries Act of 1972. The amendment implemented those features of the recent Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter not presently included in the statute. The Act regulates the dumping of materials into ocean waters within U.S. jurisdiction. The Convention made a similar international agreement to regulate dumping of waste materials. The committee received the Administration's proposed amendment in February 1973, received testimony from witnesses representing several government departments supporting enactment of the amended bill, and approved it in September 1973. The amendment expands the coverage of the bill in regulating U.S. vessels and aircraft, materials which may be dumped, and federal agency activities already controlled under the Act. (Dillingham-Florida)
W74-12611

AUTHORIZING AND PROVIDING FOR CONSTRUCTION OF A WATER DISTRIBUTION SYSTEM AND A WATER SUPPLY FOR THE SOBOBA INDIAN RESERVATION.
Committee on Interior and Insular Affairs (U.S. House).
H.R. Rep. No. 1017, 91st Cong, 2nd Sess (1970). 18 p.

Descriptors: *California, *Administration, *Legal aspects, *Water supply, *Federal reservations, Water, Resources development, Water requirements, Water allocation(Policy), Water distribution(Applied), Land ownership, Irrigation, Domestic use, Federal government, Administrative agencies, Decision-making, Construction, Economic aspects, Political aspects, Water distribution, Farm use, Water law, Water conveyance, Conduits, Water works, Release.
Identifiers: Soboba Indian reservation(Calif).

The Secretary of the Interior is authorized to approve an agreement entered into by the Soboba Band of Mission Indians. The agreement releases an Indian claim against the Metropolitan Water District of Southern California and the Eastern Municipal Water District. In return the agreement provides for the construction of a water distribution system and a water supply for the Soboba Indian Reservation. Payment of $30,000 will be made by Metropolitan to the Secretary of the Interior for the benefit of the Indians. This payment will be made only after the lands that comprise the Soboba Indian Reservation are annexed to Metropolitan. All released claims issued from the construction of a tunnel through the San Jacinto mountains. The release will become effective upon the completion of the concurrent annexation of the reservation lands and the execution of the water service agreement. There shall be a joint determination of additional water supply and distribution facilities in order to provide domestic and irrigation water to the reservation Indians. (Sperling-Florida)
W74-12612

JURISDICTIONAL PROBLEMS IN CANADA'S OFFSHORE,
British Columbia Univ., Vancouver.
K. Beauchamp, M. Crommelin, and A. R. Thompson.
Alberta Law Review, Vol 11, No 3, p 431-469, 1973. 6 fig, 145 ref.

Descriptors: *Jurisdiction, *Canada, *Operations, *Continental shelf, *Natural resources, Resources development, Offshore platforms, Oil, Oil industry, Mineralogy, Exploration, Exploitation, Judicial decisions, Foreign countries, Constitutional law, International law, Legal aspects, Oceans, Continental slope, International waters, Water law, Water policy.

Canada's submerged continental margin includes both the continental shelf and the continental slope. Their combined area is estimated to cover almost two million square miles. As oil and gas exploration activities concentrate in offshore regions, it is inevitable that problems such as the extent of international boundaries and federal-provincial control over offshore resources will be encountered. The historical origin of offshore rights, current international law on the subject and various methods of determining boundaries are analyzed. The federal-provincial issue is discussed with emphasis on constitutional aspects, resource sharing and administration of the offshore operation. Included is a comparative study between Canada, Australia and the United States with respect to the control, development and exploitation of offshore resources. Finally, the applicability of anchillary federal and provincial laws to the offshore region is examined. (Ritchie-Florida)

HIGH SEAS OIL PORT ACT.
H.R. Rep. No. 692, Comm. on Merchant Marine and Fisheries, 93d Cong, 1st Sess, 1974. 43 p.

Descriptors: *Water pollution control, *Legislation, *Federal government, *Oil pollution, *Continental shelf, Regulation, Water law, Oceans, Governmental interrelations, Interagency cooperation, Pollution taxes(Charges), Water quality control, Law enforcement, Water pollution sources, Water quality, Sea water, Foreign trade, Adoption of practices, Environmental effects.
Identifiers: *Licenses, *Absolute liability, *Coastal waters, *Coastal zone management, *National Environmental Policy Act, Congressional hearings, Administrative regulations.

The Committee reports favorable on the High Seas Oil Port Act as amended. The bill will amend the Merchant Marine Act of 1936, and will authorize the Secretary of Commerce to issue permits for construction and operation of certain offshore port and terminal facilities. The Act is designed to minimize adverse impacts on the marine environment which result from construction and operation of high seas oil ports; the ports are means for receiving petroleum products transshipped to the United States. The report represents the consensus of the Merchant Marine and Fisheries Committee and the Committee on Interior and Insular Affairs, which was considering similar legislation. The Secretary of the Interior would establish rules and regulations for protection of the marine environment. The Coast Guard would be charged with enforcement of the Act. Civil and criminal penalties are provided. A High Seas Oil Port Liability Fund would be created by collecting a per barrel fee from the owners of any oil off-loaded at an offshore facility. The fund would be absolutely liable for any damages resulting from operations of the facilities. (Deckert-Florida)

A PLAN FOR MICHIGAN'S SHORELANDS.
Michigan Dept. of Natural Resources, Lansing.
August, 1973. 135 p, 29 fig, 17 tab, 87 photo, 4 append.

Descriptors: *Michigan, *Great Lakes, *Zoning, *Shores, *Water resources development, Public benefits, Land management, Administrative decisions, Social aspects, Lakes, Rivers, Planning, Long-range planning, Natural resources, Public lands, Environment, Environmental effects, Land development, Wetlands, Comprehensive planning.

Michigan's Great Lakes' natural shorelands are disappearing as dunes and trees are being replaced by residential homes, motels, campgrounds, marinas, power plants and other signs of civilization. While in the past there has been little or no shoreland planning, in the future a new management approach must be adopted or the natural beauty and uniqueness of the shorelands will be destroyed and lost forever. Since a no-development policy is unrealistic, controlled development is the basis of the Michigan plan. The basic principles underlying the plan are that any new developments in the shorelands should be limited to those activities and facilities which specifically require a shoreland location, that permissible developments should be planned, designed, constructed and operated so as to harmonize with the capacities and tolerance limits of the natural shoreland ecosystem. Public policy should foster and facilitate, to the maximum extent possible, the acquisition of significant shoreland environmental areas. (Barnes-Florida)

DEEPWATER PORTS.
Hearings--Subcomm on Water Resources and Subcomm on Energy, Comm on Public Works, U.S. House of Representatives, 93rd Cong, 1st Sess, October 9, 10, 11, 1973. 379 p, 21 fig, 4 tab.

Descriptors: *Rivers and Harbors Act, *Legislation, *Deep water, *Engineering structures, *Harbors, Coasts, Port authorities, Transportation, Navigation, Offshore platforms, Permits, Regulation, State governments, Federal government, Oil reservoirs, Oil, International waters, Oil spills, Water pollution, Environmental effects, Engineering, Fuels, Water pollution sources, Ships, Adoption of practices.
Identifiers: *Coastal waters, *Oil Pollution Act, *Administrative regulations, *Congressional hearings, *Licenses.

This bill is an amendment to the Rivers and Harbors Act of 1965. It would establish a Federal licensing program for the regulation of construction and operation of port facilities behond three nautical miles from the coast of the United States. Such facilities are used principally for unloading crude oil and petroleum products between deep-draft vessels and the United States. Federal issuance of a license and its retention by the applicant would be dependent upon the applicant's satisfactory demonstration that the operation of the proposed facility will continue to meet requirements for protection of the public against adverse significant effects in the environment, international navigation, and land use along adjacent coasts. The hearings on this bill considered the alleged economc and environmental advantages accruing from deepwater ports, the possibility of their increasing the supply of fuel in the U.S., the testimony of expert witnesses regarding criticisms and commendations of specific points of the bill, as well as the depositions and testimonies of states and companies interested in deepwater port construction. ENVIRONMENTAL DEFENSE FUND V. FROEHLKE (REQUIREMENTS FOR ENVIRONMENTAL IMPACT STATEMENTS).
473 F, 2d 346 (8th Cir 1972).

Descriptors: *Flood control, *Channel improvement, *Judicial decisions, *Legislation, *Flood protection, Water law, River basin development, Flood plain zoning, Legal aspects, Water resources development, Water policy, Flood plain, Comprehensive planning, Planning, Channelization, Water resources development.
Identifiers: Environmental Impact Statements.

The case challenges the Cache River-Bayou DeView Channelization Project. The project was authorized by the Flood Control Act of 1950. It called for clearing, realigning, enlarging and rechanneling portions of the Cache River and its tributaries. The plaintiff attacks the inadequacy of the environmental impact statement. Secondary questions charge violations of the Water Bank Act, the Fish and Wildlife Coordination Act or the Flood Control Act. The court held that it had a right to make a substantive review of the impact statement on the merits. The court stated that the complete formal impact statement represents an accessible means for opening up the agency decision-making process and subjecting that process to critical evaluation by those outside the agency. The court found the plaintiff's other contentions without merit and remanded the case to the District Court with instructions to require the Corps to submit a revised impact statement. (Gragg-Florida)

ADAMS V. MONTANA POWER CO. (ACTION TO DETERMINE ADMIRALTY JURISDICTION).
354 F Supp 1111 (D C Mont 1973).

Descriptors: *Montana, *Judicial decisions, *Navigable waters, *Water law, *Legal aspects, State jurisdiction, Federal jurisdiction, Jurisdiction, Interstate, Constitutional law, Regulation, Ships, Transportation, Navigation, Law enforcement, Rivers, Missouri River, Navigable rivers, Inland waterways, Water policy.

Action was brought against a power company for death of decedent drowned in a small boat which capsized in the discharge from the power company's dam on the river. The court held that the 25-mile navigable stretch of the Missouri River was used by small boats only and had nothing resembling traditional maritime activity thereon. Thus it was the type of water which the law of admiralty should govern and Montana courts could exercise jurisdiction over it and apply familiar concepts of Montana tort law. Under the 'locality rule', once rather generally accepted, if a tort occurred on what was a navigable water, then admiralty jurisdiction automatically followed. Admiralty law developed out of the need of commerce on the seas for a law which related to the needs of that commerce. Thus if the problem is what body of law should govern activities on water it is unrealistic to ignore facts regarding maritime activity. (Ritchie-Florida)

Identifiers: *Coastal zone management, *Coastal zone.

Offshore wells are the source of an increasing percentage of new petroleum reserves. Continental shelves currently produce one-fifth of world petroleum output and are expected to increase that share to one-third within ten years. Geological surveys indicate that adequate reserves exist and can be found to meet future demand. The question is whether such reserves can be economically brought into production in the next decade. Beyond the need for new technology, there are legal and political disputes involving jurisdiction over off-shore minerals. These disputes take two forms: international disputes over a body of water bordered by two or more sovereign nations, or domestic disputes within federal systems between the central government and its constituent units. The U.S. Government was uninterested in exerting jurisdiction prior to the Truman Declaration of 1945. Before the doctrine Washington did not question state government ownership of submerged lands as established by Supreme Court decisions. Though the Truman Proclamation in itself only made statements about the shelf vis-a-vis other countries it signaled the beginning of federal control and end of state control of the sea bed. 6F. Nonstructural Alternatives

FLOOD PLAIN STUDIES IN ONTARIO,
Dillon (M. M.), Ltd., Toronto (Ontario).
F. I. Lorant.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 64-76, 1973. 6 plate.

Descriptors: *Flood plains, *Flood protection, *Flood plain zoning, *Non-structural alternatives, Mapping, Design storm, Flood frequency, Design flood, Canada.
Identifiers: *Ontario.

The Province of Ontario minimizes flood damages by the regulation of development in flood plains. Fundamental to the application of such preventive regulations is the accurate definition of the flood plain. Current procedures in Ontario for such flood plain studies including design frequencies, magnitude of regional design storms, and observed and estimated flood peaks are described. Commonly used photography and mapping scales and cost estimates are given. (See also W74-12087) (Knapp-USGS)

FLOOD CONTROL, NAVIGATION, AND OTHER ALTERNATIVE WATER RESOURCES POLICIES IN MINNESOTA,
Minnesota Univ., Minn. Dept. of Agricultural and Applied Economics.
J. J. Waelti.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 821, $3.25 in paper copy; $2.25 in microfiche. Minnesota Water Resources Research Center, St. Paul, Aug. 1974, Mimeographed Rept. 25 p, 3 ref. OWRT B-054-Minn(4), 14-31-0001-3601.

Descriptors: *Water resources, *Flood control, *Navigation, Environmental control, *Minnesota, *Water policy, Flood plains, Costs, Mississippi River, Legal aspects, Dredging, Alternate planning, Non-structural alternatives.
Identifiers: Flood costs.

Research was carried out in three areas of water resources in Minnesota: flood control, navigation, and general water policies. Research results indicate that governmental units were the ultimate bearers of nearly half of the flood costs in the Minnesota River Basin in the 1965 and 1969 floods. An incidence of costs analysis provides justification for the imposition of land-use restrictions in flood plains. Vigorous enforcement of the Minnesota 1969 Flood Plain Management Act which stresses non-structural solutions to flood problems is recommended. The current issues in commercial navigation which affect Minnesota basically involve a resolution of the conflict between developmental and environmental values; such is the issue of dredging to maintain the 9-foot navigation channel on the Upper Mississippi River. Without maintenance dredging, barge traffic would come to a halt on the Upper Mississippi causing irreparable economic harm. The Corps' present method of dredging and depositing of dredge spoil causes irreparable environmental damage by blocking the flow of backwater sloughs. However, the Corps is not ready to accept full responsibility for closure of these sloughs on the Upper Mississippi River. A possible alternative is for users of the 9-foot navigation channel to be required to pay the full costs of environmentally sound dredge spoil disposal. With a system of user charges in effect, environmental values would be better accounted for and barge transportation will be assigned to its most efficient position in the national transportation system. (Walton-Minnesota)

Montana University Joint Water Resources Research Center, Bozeman, Completion Report No 51, July 1974. 75 p, 10 fig, 4 tab, 19 ref, 3 append. OWRT A-065MONT(1), 14-31-0001-3826.

Descriptors: *Flood plains, *River basin development, *Montana, *Water table, *Seismic waves, *Water level fluctuations, Aerial photography, *Planning, Flood frequency.
Identifiers: *Clark Fork River(Mont).

A 33-mile reach of the Clark Fork River east of Missoula, Montana, was the subject of a two-year hydrology and flood hazard study. The 100-year flood plain was delineated by a unique method incorporating aerial photographs obtained during a flood of known recurrence interval, and synthesized rating curves developed for several sites in the reach. The maps, which were developed at a cost of $120 per river mile, are believed to be nearly as accurate as maps obtained by more sophisticated and costly techniques. Water levels in 20 wells were monitored during a one-year period to determine piezometric surfaces and water table fluctuations. Gravity traverses were made to determine bedrock configurations and depths to bedrock. The seismic refraction method was used for calibration of depth calculations. (Williams-Montana State)

SOCIAL DIMENSIONS OF URBAN FLOOD CONTROL DECISIONS,
Utah State Univ., Logan. Inst. for Social Science Research on Natural Resources.
W. H. Andrews, and D. C. Geertsen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-236 037, $3.75 in paper copy, $2.25 in microfiche. Research Monograph No. 3, January 1974. 69 p, 5 fig, 22 tab, 42 ref, append. OWRT A-010-UTAH(2). 14-31-0001-3845.

Descriptors: *Flood control, *Decision making, Aesthetics, *Attitudes, Social values, Social aspects, Management.
Identifiers: *Social variables, *Urban flood control.

An exploratory study of the social variables that are likely to be important in making public decisions about controlling flood waters of local streams was made. In addition to discovery of social factors the objectives included description and measurement of attitudes, needs and actions related to the decision problem as well as analysis of certain institutional constraints or organizational problems of government agencies affecting the drainage decision process. Social factors identified related to several areas including flooding experience, awareness and information, level of concern, attitudes about flood management attitudes toward and knowledge about specific proposals, social participation, aesthetic, leisure and environmental measures and demographic characteristics. Numerous federal, state and local agencies are involved in flood control activities, some more directly than others. Central responsibility was mainly with the county and the Army Corps of Engineers. There was a high degree of interrelatedness among these agencies as well as conflicting differences. Home ownership, location of residence, length of residence, higher education and male sex were factors associated with higher awareness.

6G. Ecologic Impact Of Water Development

ENVIRONMENTAL IMPACT ANALYSIS: THE EXAMPLE OF THE PROPOSED TRANS-ALASKA PIPELINE,
Geological Survey, Washington, D.C.
D. A. Brew.
Circular 695, 1974. 16 p, 3 fig, 8 ref.

Descriptors: *Alaska, *Oil fields, *Pipelines, *Environment, Environmental engineering, Planning, Frail lands, Social aspects, Economics.
Identifiers: *Environmental impact analysis, *Trans-Alaska pipeline.

The environmental impact analysis made as required by the National Environmental Policy Act of 1969 for the proposed trans-Alaska pipeline included consideration of the (1) technologically complex and geographically extensive proposed project, (2) extremely different physical environments across Alaska along the proposed route and elsewhere in Alaska and in Canada along alternative routes, (3) socioeconomic environment of the State of Alaska, and (4) a wide variety of alternatives. The environment was divided into two general parts--natural physical systems and superposed socioeconomic systems--and those parts were further divided into discipline-oriented systems or components that were studied and analyzed by scientistis of the appropriate discipline. Particular attention was given to potential feedback loops in the impact network and to linkages between the project's impacting effects and the environment. The principal unavoidable effects would be (1) disturbances of terrain, fish and wildlife habitat, and human environs, (2) the results of the discharge of effluent from the tanker-ballast-treatment facility into Port Valdez and of some indeterminate amount of oil released into the ocean from tank-cleaning operations at sea, and (3) the results associated with increased human pressures of all kinds on the environment. Comparison of alternative routes and transportation systems and of their environmental impacts provided information which indicates that one corridor containing both oil and gas pipelines would have less environmental impact than would separate corridors. Identifiers: *Environmental impacts, Noise.

The part of the National Environmental Policy Act of 1969 (NEPA), Public Law 91-190, which has received the most attention has been Section 102(2) (c), requiring the preparation of 'Environmental Impact Statements' for all Federally funded construction that may adversely affect the environment. In response to this requirement, many agencies have attempted to prepare methodologies for impact assessment. A field application is described of an environmental impact assessment methodology designed by Battelle Memorial Institute (Columbus Laboratories) for the Georgia Department of Transportation to one rail line of the planned Metropolitan Atlanta rapid transit system. The methodology, among the most rigourous and explicit of the available impact evaluation techniques, utilizes a number of value functions for converting information on a wide variety of dissimilar environmental effects to commensurable quantitative units. The conversion permits aggregation and evaluation of overall environmental impact and of tradeoffs among individual effects. Alternate value functions can be readily explored, and new ones can be added as desired. The methodology includes (1) a comprehensive checklist of 68 environmental factors, (2) a method for measuring the impact magnitude for each factor, and (3) value functions for weighing the importance of diverse impacts. A critical evaluation of the validity and usefulness of the method for incorporating environmental concerns into the planning-decision process shows one of the biggest problems to be prediction of the environmental conditions without the project. Several existing environmental assessment techniques are reviewed. (James-Georgia Tech)

Representatives of 113 nations, 16 interstate agencies, and about 250 international societies attended the United Nations Conference on the Human Environment, held June 5-16, 1972, which was concerned with global ecological problems. A major outcome was the adoption of a declaration on the human environment, embodying 26 guideline principles and 106 recommendations directed at national governments and international agencies regarding actions against further pollution of natural waters and the atmosphere. As a corollary, an environmental secretariat was established with headquarters in Nairobi for initiation and coordination of U.N. antipollution programs. (See also W74-12400) (Brown-IPC)

FINAL CONFERENCE REPORT FOR THE NATIONAL CONFERENCE ON MANAGING THE ENVIRONMENT.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-227 033, $16.50 in paper copy; $2.25 in microfiche. Environmental Protection Agency, Washington, D.C., Office of Research and Development, (1974), 269 p.

Descriptors: *Environment, *Management, *Comprehensive planning, *Pollution, Ecology, Decision making, *Legal aspects, Local governments, State governments, Federal government, *Institutional constraints, *Intergovernmental relations.
Identifiers: Environmental quality.

The National Conference on Managing the Environment was held on May 14 and 15, 1973, in Washington, D.C. Approximately 350 persons, predominantly public officials of all levels of government, attended the discussions of various aspects of environmental management. The conference sessions covered the following topics: the environment--how comprehensive; interaction at the local level; a decision maker faces the environment; local government experience; regional government experience; legal and judicial constraints; public involvement; environmental technology; growth; standards; comprehensive planning; intergovernmental relations; and four technical workshops. The conference was sponsored by the Environmental Studies Division, Washington Environmental Research Center, U.S. Environmental Protection Agency. (See also W74-12458 thru W74-12478)

BEYOND THE BRUSHFIRES,
Environmental Protection Agency, Washington, D.C.
R. W. Fri.
Final Conference Report for the Environmental Protection Agency, Washington, D.C. National Conference on Managing the Environment, p I:4-I:7, 1974.

Descriptors: *Environmental control, *Air pollution, *Water pollution, *Comprehensive planning, *Operations research, Technology, Simulation analysis, Planning, Regulation, Social aspects, Systems analysis, Land use, Ecology.

Many environmental problems now dealt with on an emergency basis could have been predicted and resolved long ago. Automobile pollution projections could have been made in the 1950's. The information necessary to develop systems solutions to many ecological problems is available now. The situation in San Diego is illustrative. In 1971, 158,000 tons of volatile organic compounds were vaporized into the atmosphere. Regulations to minimize loss of gasoline created at transfer points were put into effect. Technology existed to minimize the vaporization. As a result, the county of San Diego will annually save 6.15 million gallons, which will more than pay the technology costs. Certain steps must be taken to insure optimum application of existing technical knowledge. Local governments must acquire a new level of expertise in areas like operations analysis, airshed models, land planning, and traffic simulation. Alliances must be formed in areas where environmental problems overlap jurisdictional lines. Diverse local agencies must be united for a coordinated effort on paoblems which do not have piecemeal solutions. Most importantly, the traditional American concept of growth will have to be reexamined. We will have to make do with less energy, smaller cars, and more personal restraints. We will realize our fundamental dependence on the biological world, and the necessity of stability in its maintenance. (See also W74-12457) (LaPointe-North Carolina)

MANAGEMENT FOR THE FUTURE,
Council on Environmental Quality, Washington, D.C.
R. E. Train.
Final Conference Report for the National Conference on Managing the Environment. Environmental Protection Agency, Washington, D.C., p I:8-I:12, 1974.

Descriptors: *Administration, *Decision making, *Management, *Monitoring, *Environmental control, *Environmental effects, Optimization, Technology, Ecology, Systems analysis, Alternative planning.
Identifiers: *National Environmental Protection Act(NEPA), *Public participation, Environmental Impact Statement(EIS).

An effective management system must possess two key elements: (1) the best information and feedback for decision making; and (2) follow-up decisions and tasks. Two essential information inputs to environmental decision making are monitoring and improvement of the data base, and citizen participation. Good monitoring data, in easily understandable forms, assures optimum achievement of goals. Further research is required in determining the health effects of pollutants, and economic and social impacts of various regulatory systems. Monitoring should go beyond the direct determination of pollutant concentrations to fish, wildlife, forests, and soils. The single most important input to the environmental management process is citizen participation, which the National Environmental Protection Act has sought to maximize. By open discussion of the alternatives with the public, a broader range of alternatives is made available. Goal setting must be carried out in full public view if confidence in the goals is to be assured. The environmental impact analysis has created a magnificent tool for furthering public comment. This analysis not only requires the presentation and elaboration of alternatives, but provides for multidisciplinary discussion which is essential to the resolution of complex problems. Another important reason for furthering public participation is to discourage the feelings of alienation and inevitability that the average citizen has as the complexity of problems increases. THE ECONOMICS OF ECOLOGY,
Colorado Univ., Boulder.
K. E. Boulding.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p II:13 - II:17, 1974.

Descriptors: *Economics, *Ecology, *Speciation, *Niches, *Population, *Limiting factors, Competition, Goods, Ecosystems, Environment, Economic impact, Economic efficiency, Wastes, Equilibrium, Social aspects, Social values, Constraints, Trade associations.
Identifiers: Excretions.

The economic subsystem is a subset of the human social system and therefore of the total ecological system. Many material economic entities, such as automobiles and dollar bills, can be viewed as ecologic species in that they require both materials for growth (production), energy for mobility (fuel or muscular energy), and produce excretions (gaseous combustion products from automobiles). Because man possesses a nervous system which assimilates large quantities of knowledge and a mental faculty for analysis, he has an unusual capacity for cooperation with his own artifacts (wheat, machines, clothing, automobiles, etc.) with consequent continued expansion of the human niche and increased population growth. Humans compete with other species for a share in the total ecosystem. Almost all human economic activity produces both 'goods' and 'bads'. Beef production means polluting feedlots; power production, polluting power plants. The major problem is in insuring that private decisions which hope to maximize private benefits, also produce public benefits. Many current ecological problems, like wilderness preservation, cannot be resolved by reliance on the private marketplace. The question of how much further the human race can expand its ecological niche is dependent upon the type of economic and social structure (i.e. basic energy source, necessities, life styles), which can be sustained. The study of ecology can point out the limitations that the human niche does have at some point in time, in order to insure a stable and reasonably agreeable spaceship earth. PLANNING FOR QUALITY GROWTH,
Hawaii State Dept. of Planning and Economic Development, Honolulu.
S. M. Mark.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. II:18-II:25. 1974.

Descriptors: *Land use, *Planning, *Hawaii, *Legislation, State governments, State jurisdiction, Environment, Land resources, Land classification, Land development, Federal government, Physical control.
Identifiers: *National Land Use Policy Act, *New Federalism.

The State of Hawaii passed a land use law in 1961 providing for classification of all public and private lands as urban, rural, agricultural or conservation, with a reclassification every five years, and assignment of the land uses permitted under each classification. As a result land speculation and scattered development have been greatly reduced and prime agricultural and conservation lands have been preserved. The Hawaiian experience offers many insights to states now embarking on land use programs of their own, and will be a helpful example when after passage of the National Land Use Policy Act, states are forced to undertake comprehensive planning. Much of the burden of defining specific goals and creating relevant organizational structures will be borne by the states with the incentive of federal funding. In the interim, before a national act is passed, states should develop their own planning capabilities and sort out the complex local jurisdictional problems that have historically impeded rational environmental management. Whereas environmental planning has centered around physical and spatial concerns, and economic and population questions, now focus must shift to 'quality growth,' or total environmental quality, encompassing social as well as economic criteria. A workable definition for quality growth, reflecting the proper balance of economic, social and environmental objectives, together with criteria for measuring such growth and methods for including public participation in the discussion now need urgent development by state planning councils. ENVIRONMENTAL DECISION MAKING,
J. Wentz.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. II:26-II:31. 1974.

Descriptors: *Land use, *Environment, *Planning, *Decision making, Administration, *Arizona, Project planning, *Local governments, Zoning, City planning, Land classification, Land resources, Irrigation, Sewage effluents, Landfills, Recreation.
Identifiers: *Open space, *Phoenix(Ariz).

The goal of environmental management is defined as the creation and maintenance of a productive harmony between man and his environment. Productive harmony implies a balance between the quality of the surroundings and economic costs of that quality. Phoenix is taking positive steps to achieve this. In July, 1971, the City Council established a 21 member ongoing Environmental Quality Commission to identify problems and propose solutions, and aided by an environmental planner, many changes have already taken place at the local level. Hillside ordinances have been adopted to reduce density, visual pollution of signs is being heavily reduced, and backup treatment is now required for residential development insuring no more bleak backwalls along major streets. Tree planting programs are underway mostly in inner city areas and a major thrust is being directed to a new open space program including outlay of $40 million to buy the Phoenix Mountains in the central city, the land to be kept in its natural state to prevent dangerous development along the mountainsides. Various landfill projects together with the purchase of private lands will create parks. EPA is financing a study of converting Phoenix sewage plant effluent to a quality sufficient to use as truck farm irrigation, and another portion of sewage will cool a nuclear reactor now under construction. Environmental impacts of all projects must be determined prior to construction, however a more objective cost-benefit analysis is needed. (See also W74-12457) (LaPointe-North Carolina)
W74-12462

INCREMENTALISM AND ENVIRONMENTALISM,
Yale Univ., New Haven, Conn.
C. Lindblom.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. II:32-II:34. 1974.

Descriptors: *Planning, *Comprehensive planning, Alternate planning, Long term planning, Environment, Decision making, Social change.
Identifiers: *Incrementalism, *Selective planning.

The goal of comprehensive planning is an almost universally accepted axiom. However, such planning is by its very nature doomed to frustration and failure. Complexities of current problems which are cited as reasons for comprehensive planning serve only to limit the completeness or broadness of planning. The planner will never have enough information or the breadth of expertise to develop a comprehensive plan. Rather a selective approach to planning emphasizing discrimination, strategy, and flexibility in the face of errors must be developed. This would allow the decision maker room to maneuver, room to attack a particular problem from a high focus, and then to pull back and weigh new information gained in order to continue the attack. Broad planning practices can be hampered by the desire to apply the scientific method which is designed for mastering a narrow, well defined problem ignoring interrelated variables; reliance on conceptualization rather than the more painstaking selective approach; the conventional wisdom that we arrived at our environmental difficulties piecemeal and only some other method will extricate us (an idea strongly rejected); and the argument that only all-encompassing solutions are viable. W74-12463

THE POSITIVE ROLE OF ENVIRONMENTAL MANAGEMENT,
Indiana Univ., Bloomington. Dept. of Political Science; and Indiana Univ., Bloomington. Dept. of Public and Environmental Affairs.
L. K. Caldwell.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. III:19-III:24. 1974.

Descriptors: *Environment, *Environmental effects, *Environmental control, *Administration, *Legislation, Land use, Planning, Pollution abatement, Federal government, Urban renewal, State government, Federal jurisdiction.

The public outcry for environmental enhancement in the 1960's spurred the formation of the Environmental Protection Agency and The Council on Environmental Quality, together with a variety of state and local agencies. While there have been some improvements, measures taken thus far have been mostly of a stopgap nature designed to prevent further environmental degradation and to preserve some land areas. The major task of restoring damage already inflicted upon the environment has not been addressed. The establishment of an Environmental Reconstruction Agency to pursue this goal is proposed. This agency would be a coherent system capable of deploying knowledge, manpower, and money in assisting local citizenry in fully analyzing environmental options. Especially critical areas could receive a national focus, e.g. the Southern Appalachians, the arid Southwest, and many inner cities. The agency would be responsible for restoring derelict land, the removal of decayed structures from urban areas, and the grouping of small settlements into more viable communities. The expertise of the Corps of Engineers could be enlisted. An initial budget might be of the order of $10 billion, with a like amount generated from local and state funds. Enactment of a national land use policy act would be a necessary forerunner of such an agency. (See also W74-12457) (LaPointe-North Carolina)

STATE GOVERNMENTS TACKLE POLLUTION,
Woodrow Wilson International Center for Scholars, Washington, D.C.
E. H. Haskell.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. III:25-III:33. 1974. 2 fig.

Descriptors: *State governments, *State jurisdiction, *Consolidation, *Administrative agencies, *Governmental interrelations, *Environmental control, Land use, Legal aspects, Water resources development, Water quality control, Reviews, Pollution abatement, Solid wastes, Adoption of practices.
Identifiers: Illinois Environmental Protection Act of 1970, Maryland Environmental Service, Class action lawsuits.

Many state governments are moving dramatically to develop the implementation capabilities they will need to carry out federally or state mandated environmental protection programs. Such governments are responding in a variety of ways from reorganizing old agencies to developing new ones. The most prevalent change has been the relocation of the many environmental functions of state government from scattered agencies into one comprehensive organization. Illinois, Minnesota, Wisconsin, Washington, and New York are some examples of this approach. Pollution control is the major focus of these new agencies. In many states the environmental department is overseen by an interagency or civilian board. These attempts at consolidation hopefully will allow for more comprehensive planning, minimize duplication, maximize efficiency, vocally advocate environmental issues, and build a stronger political base for environmental protection. Many of the myriad part-time review boards, which rule on environmental issues, are now full-time and equipped with staff, some have been phased out in favor of one administrator, and some are subject to the veto of an environmental commission. Some states have taken on entirely new functions in order to address environmental problems. Vermont and Maine have established land use control systems requiring permits to build or develop land. In Vermont this function is administered by the Agency of Environmental Conservation. The new Maryland Environmental Service has the authority to construct and operate waste treatment facilities previously a function solely under the direction of local governments. Class action lawsuits by private citizens have been authorized in Michigan and are under consideration in many other states. (See also W74-12457) (LaPointe-North Carolina)
W74-12465

REGIONAL ENVIRONMENTAL MANAGEMENT AND THE DECISION MAKING PROCESS,
San Diego County, Integrated Regional Environmental Management Project, Calif.
L. E. Coate.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. III:34-III:42. 1974. 3 fig.

Descriptors: *Regional development, *Regional analysis, *Decision making, *Economic impact, *Environmental management, Cost comparisons, Computer models, Carrying capacity, Planning, Short term planning, Long term planning, Land use, Local governments.
Identifiers: Environmental Impact Report, Integrated Regional Environmental Management Board(IREM).

Of the various levels of governmental agencies, those at the local level have undergone the least reorganization and been the least apt to apply new environmental management techniques. Because environmental problems lend themselves more to regional than local solutions, there has been considerable difficulty in determining by whom and how decisions are to be implemented and enforced. This has been complicated by the emergence of land use planning and transportation planning as major strategies replacing traditional abatement policies. Added to this is the conflict between the incremental decisions made in local situations and the regional planning process which is comprehensive and general. In order to equip themselves with the capabilities of responsibly managing the environment, local and regional agencies must develop a more incremental planning process, and this process must include land use considerations. The Environmental Impact Report, and permit systems such as those outlined in the California Coastal Zone Conservation Act are models of some of the elements of such a process. San Diego has developed a computer model incorporating both the environmental and economic impacts of proposed projects, which is being tested in four local developments. In addition, a computerized early warning system and an Environmental Review Board overseeing impact report preparation have been established. Refinements to the computer models will include data on the carrying capacity (optimum population) of San Diego County. Also an ideal index diagram of standardized format, incorporating all relevant environmental, economic, and social information is being evaluated. (See also W74-12457) (LaPointe-North Carolina)
W74-12466

A DESCRIPTION OF THE ENVIRONMENTAL PLANNING AND MANAGEMENT PROJECT,
Metropolitan Government of Nashville Davidson County, Tenn.
D. Battle.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. III:43-III:47. 1974.

Descriptors: *Environmental management, *Environmental control, *Planning, *Water quality control, *Priorities, Landfills, Land use, Solid wastes, Public benefits, Energy, Electric power, Electric power production, Conferences, Communication, Community development, *Tennessee.
Identifiers: Davidson County(Tenn), Environmental planning, Environmental Planning and Management Project(EPMP), Nashville(Tenn).

In 1963 Davidson County incorporated the city of Nashville, and the smaller surrounding communities, into one Metropolitan District with a centralized Metropolitan Government. Two service areas were defined, one of high density defined by the city limits of Nashville, one one comprising the entire 533 square miles of the county. In 1972, financed by a private grant, the Metropolitan Government established the Environmental Planning and Management Project (EPMP). Its objectives were to define environmental problems, establish priorities for their resolution, and develop within the local agencies the expertise necessary for their resolution. The EPMP consisted of representatives from the local government, the business community, and the academic community, and is designed to coordinate the varying interests and concerns of these three groups. Highest priority was given to the water quality degradation occasioned by the local meat packing industry, which generates 1/2-3/4 of the waste capacity of the already overloaded sewage treatment plant. Considerable improvement has been observed without noticeable economic damage. Another project undertaken was the study of a landfill on a diked flood plain. This yielded information on filling techniques, and showed no river pollution from the present methods. Even though Nashville will soon be using 720 of the daily 1200 tons of solid waste generated as fuel in a thermal transfer plant, the solid waste problem will continue to be very serious, and a minimum of 100 acres is currently needed for immediate use. (See also W74-12457) (LaPointe-North Carolina)

IMPLEMENTATION OF CITIZEN PARTICIPATION IN THE MUNICIPAL PROCESS,
Environmental Protection Agency, Washington, D.C. Technical Assistance Research Programs.
J. Goodman, J. Falkson, B. Mertens, and L. Happel.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. IV:10-IV:16. 1974. 8 ref.

Descriptors: *Federal Water Pollution Control Act, *Conferences, *Public rights, *Decision making, Planning.
Identifiers: *Citizen participation, *Public hearings, *Implementation, Advisory boards, Workshops, Municipal process.

The Federal Water Pollution Control Act stipulated that public participation should be provided for and encouraged prior to acceptance of a plan; i.e. local citizenry must be involved in goal setting and implementation procedures. Unless public participation is developed in a way allowing substantive input and a feeling of public satisfaction, frustration can result, culminating in political or legal conflict causing long expensive project delays. Mechanisms of public participation with the most widespread use are: (1) Public hearings, which often do not offer an opportunity of feedback from the decision maker to the public revealing the impact the hearing has had on the decision; (2) Advisory boards, serving as a communication bridge between officials and townspeople, and which may be hampered by members who lack the expertise necessary to evaluate technical information. Further, officials may be reluctant to accept the board's advice; (3) Workshops can be used to complement either hearings or advisory boards and should be organized around a particular project. Separate sessions for citizens and city officials should be held prior to joint sessions. Citizen workshops should focus on legal requirements, project details, and analysis of case studies pertinent to possible action. Planner workshops should emphasize implementation of participation, publicity for meetings and hearings, and previous case studies of citizen participation. Proper timing is essential; the public must be consulted prior to the decision making, if conflict is to be reduced and planning efficiency increased. (See also W74-12457) (LaPointe-North Carolina)

FIXED VERSUS VARIABLE ENVIRONMENTAL STANDARDS,
MITRE Corp., McLean, Va.
R. Pikul.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. V:38-V:57. 1974. 2 fig, 4 tab, 27 ref.

Descriptors: *Environmental control, *Standards, *Variability, Administrative costs, State jurisdiction, Environmental effects, Fuels, Electric power production, Air pollution, Coals, Sulfur, Air pollution effects, Radiation, Economic impact, Social impact.
Identifiers: Fixed environmental standards, Variable environmental standards, Enforcement strategies.

While both water and air standards require a fixed time interval, attaining such standards can result in implementation procedures which allow great variation in enforcement. Actually today only the ambient air quality standards and the mobile source emission standards may be truly regarded as fixed. Variable standards have their basis in the variation of a number of factors which affect pollutant emission and the assimilative capacity of the environment. Such parameters include time, which is usually fixed by law; space (different geographical areas); source categories; individual emitters within source categories; and the use of resource receiving the waste. The latter parameter is especially important in the case of water standards with different uses requiring widely varying water quality. In order to meet the Ambient Air Quality standards, a number of states have employed variable controls in their implementation plans. Some objections to variable standards are the economic inequalities which would ensue if manufacturers of like commodities face different control costs, the high administrative costs of variable controls, and the administrative difficulty in the production of different products (e.g. automobiles) for use in different geographical areas. However the economic benefits and flexibility provided by variable controls might represent a greater overall benefit. For example, standards which considered time variations of assimilative capacity based on meteorologic changes would allow for more efficient allocation of low sulfur coal. High emission standards on major polluters might give a lower total cost solution than equalized emission standards on all polluters. (See W74-12457) (LaPointe-North Carolina)

THE COOPERATIVE APPROACH TO ENVIRONMENTAL ENHANCEMENT,
State Univ. of New York, Albany.
J. F. Zimmerman.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. VII:19-VII:39. 1974. 9 tab, 14 ref.

Descriptors: *Environmental management, *Local governments, *Political aspects, *Regional development, *Water resources, Adoption of practices, Water management(Applied), Legal aspects, Economies of scale, Economic efficiency, Contract, Contract administration, Governmental interrelations.
Identifiers: Service agreements, Opinion poll.

Service agreements which exploit economies of scale between local and/or county governments have become much more popular in the past 25 years, mainly due to easing of statutory restrictions and recent state incentives established to encourage cooperation between governments. The regional character of environmental management should increase emphasis on service agreements. A written questionnaire, designed to ascertain the extent of an attitudes toward service agreements, has 2375 municipalities responding out of a possible 5900. Conclusions were that 60% of the governments engage in such agreements, with only one service usually involved, and that council-manager governments enter into service agreements more frequently than other forms of municipal administration. Widespread and successful use of multi-lateral service agreements as determined by a metropolitan planning commission, council of governments or the state may create additional problems. First, expanded use could add to the burden of complexity already harassing

local governments. Secondly, service agreements could strengthen the fragmented governmental system and further encourage the fiscal disparity between nonviable, tax benefiting 'paper' communities and larger tax poor urban areas. Service may, in the end, only serve to impede the formation of metropolitan government and act as a stopgap measure for resolving major problems. This could lead to increased pressure for federal and state government action. (See also W74-12457) (LaPointe-North Carolina)

Identifiers: *Environmental Impact Statements, *Oswego(NY), National Environmental Policy Statement.

The project proposes the construction of a sixth oil-fueled steam electric generating unit with intake and discharge structures, and other appurtenances. The Oswego Steam Station is located on 91 acres of land in Oswego, New York, on the shores of Lake Ontario. The new unit is necessary to meet New York's increasing power supply demands. The environmental impacts include occupation of ten acres of land, discharge of quantities of heat, air-borne emissions, liquid effluents, and sound energy as well as receipt and consumption of 9 million barrels of fuel oil per year. These are all adverse effects to some degree. Alternatives are no action, location elsewhere, purchase of power, hydroelectric instead of steam electric generation, use of other fuels or use of other cooling systems to minimize thermal pollution. The present proposal is less expensive, more efficient and minimizes deleterious effects to the environment. Irretrievable commitments include labor, materials and fuel consumption. Comments from government and citizen groups were received and considered. (Dillingham-Florida)

SURVEY OF ENVIRONMENTAL LEGISLATION,
A. C. Jacobson.
University of Miami Law Review, Vol 26, No 4, p 778-803, Summer 1972. 276 ref.

Descriptors: *Florida, *Legislation, *Political aspects, *Environmental sanitation, *Federal government, Government finance, Oil industry, Oily wastes, Social aspects, Measurement, Wildlife conservation, Water pollution control, Conservation, Coordination, Ecology, Water resources development, Water law, Administration, Statutes, Institutional constraints, Planning, Recreation demand, Industrial waste, Aesthetics, Environmental effects.
Identifiers: *Coastal zone management.

Legislation in the Florida Statutes dealing with the environment is described. The legislation passed in 1970 and 1971 reflected the growing concern for the public for protective measures. Some concern has stemmed from damaging oil spills that have occurred in recent years. In 1970 and Oil Spill Prevention and Pollution Control Act as well as the State Wilderness System Act was passed. The Florida Litter Law of 1971, the Environmental Protection Act of 1971, and chapters 71-203 and 71-36 represent some of the major legislative actions involving current environmental problems. The educational facilities of the state regarding environmental studies received a boost when five acres of spoil island were made available for a marine shore facility. It is necessary to work in conjunction with adjacent states as well as the federal government to attack common problem areas. If the legislature is responsive to the needs and demands of the public, then the increase in legislation also points out the awareness of the public to environmental needs. (Sperling-Florida)

GEOLOGIC AND MINERAL AND WATER RESOURCES INVESTIGATIONS IN WESTERN COLORADO USING ERTS-1 DATA: PROGRESS REPORT II.
Colorado School of Mines, Golden. Dept. of Geology.
Available from NTIS, Springfield, Va. 22161 as N73-27289, Price $4.50 printed copy; $2.25 microfiche. Progress Report for June 31-November 11, 1972 for Goddard Space Flight Center, December 1972. 43 p, 9 fig, 3 tab. NASA Contract NaS5-21778.

Descriptors: *Geologic mapping, *Remote sensing, *Satellites(Artificial), *Water resources, Mapping, Photogrammetry, Terrain analysis, Structural geology, *Colorado.

Preliminary geologic interpretations of ERTS-1 scenes in central and western Colorado indicate that lithologic discrimination and structural interpretation can be made on ERTS-1 images. Generally, lithologic units are composed of 2 or more recognized geologic formations and should more correctly be referred to as remote sensing units. Faults mapped on ERTS-1 images in western Colorado correspond well with faults mapped on the geologic map of Colorado (1:500,000). Stratigraphic offset was easily detected along faults as short as 3 km; faults as short as 1/2 km should be identifiable. Several previously unmapped major linear features, possibly faults, were detected and mapped. Stereoscopic analysis of ERTS-1 imagery greatly enhances the capability of the interpreter. Structural features and lithologic contacts are more accurately traced and more remote sensing units can be defined. Ambiguous or questionable structural interpretations are commonly quickly resolved by stereoscopic analysis. (Knapp-USGS)

Available from NTIS, Springfield, Va 22161 N73-23468, Price $3.25 printed copy; $2.25 microfiche. NASA Technical Memorandum X-66237, May 1973. 24 p, 6 fig, 25 ref.

Descriptors: *Remote sensing, *Hydrologic data, *Telemetry, *Satellites(Artificial), Data collections, Mapping, Surveys, Floods, Glaciers, Turbidity, Path of pollutants, Monitoring.
Identifiers: ERTS.

The Earth Resources Technology Satellite (ERTS-1) provides very applicable data for effective monitoring and management of surface water features over the globe. Mapping flooded areas, snowcover, and wetlands and surveying the size, type, and response of glaciers to climate are

among the specific areas where ERTS-1 data have been applied. Turbidity variations in lakes and rivers have been observed and related to shoreline erosion, industrial plant effluent, and overall water quality. In addition the Data Collection System (DCS) is a reliable tool for gathering hydrologic data from remote regions. (Knapp-USGS)

B. R. McLeod.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 830, $3.25 in paper copy; $2.25 in microfiche. Montana Water Resources Research Center, Bozeman, Completion Report No. 53, June 1974. 26 p, 15 fig, 17 ref. OWRT A-061-Mont(1), 14-31-0001-3826.

Descriptors: *Moisture meters, *Microwaves, *Forest management, *Montana, *Watershed management, Measurement, Instrumentation.
Identifiers: Controlled burns.

Microwave absorption due to a molecular resonance in water offers a possible means of measuring moisture content in various materials. This report discusses the results obtained from the first two years of a continuing research program designed to explore the uses of microwaves as a forest and watershed management tool. Two battery-powered, portable microwave moisture meters consisting of modulator, Gunn oscillator, precision attenuator, horn antennas, detector, and stable amplifier were developed. One meter was equipped with visual display, the other with dual-track recorder. The meters were tested at a study site on the Lubrecht State Forest near Missoula, Montana from June to September 1972 and 1973. The meters were used extensively to obtain basic data and to provide fuel moisture data for prescribed burns; the data were compared for litter, sticks and duff. Oven drying was used as a standard to evaluate the reliability of the meter. The meters gave consistent results agreeing with the oven dry measurements within plus or minus 3 percent. Results of the study to date have demonstrated the feasibility and usefulness of microwave moisture sensing as a valuable tool in watershed management. The portable meters allow rapid, on-site measurement of fuel moisture content just before and even during prescribed burns. Both types of gear are still in the development stage, but two of the display-equipped meters are already being used by the U.S. Forest Service.

ARCHAEOLOGICAL SURVEY IN THE TOMBIGBEE RIVER DRAINAGE AREA: MAY-JUNE, 1970,
Mississippi State Dept. of Archives and History, Jackson.
S. O. McGahey.
Mississippi Archaeological Survey Preliminary Report No 2, Jackson, 1971. 33 p, 5 fig.

Descriptors: *Archaeology, *Data collections, *Water resources development, *Mississippi, Conservation, Regional development, Preservation, History.
Identifiers: *Tombigbee River Valley.

Part of the activities of the Tombigbee River Valley Water Management District has been to protect existing natural resources. The Mississippi Department of Archives and History conducted an archaeological survey in the 12-county area of the District. Although the survey was brief, 77 sites were identified and described. The location and historic value of these sites will enter into future considerations for water resource development projects, as many of the sites are of such significance that they deserved to be saved and, possibly, developed as historic sites. It is recommended that further archaeological information be researched on the sites described and that further research be undertaken to discover other sites. It is also recommended that the Tombigbee River Valley Water Management District give careful consideration to developing the sites and protecting them against possible destruction from work on projects of the District. (Poertner)

AN IMPROVED CHEMICAL DELIVERY APPARATUS FOR USE IN INTERMITTENT FLOW BIOASSAYS,
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga. Southeastern Fish Control Lab.
J. H. Chandler, Jr., H. O. Sanders, and D. H. Walsh.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 1, p 123-128, July 1974. 1 fig, 5 ref.

Descriptors: Technology, *Design, Bioassays, Analytical techniques, Methodology, Laboratory tests, Flow systems, Pollutant identification.
Identifiers: *Intermittent-flow bioassay.

An apparatus designed to eliminate the difficulties previously encountered in intermittent-flow toxicant systems is described. It is easily adapted for use on existing diluters, has no moving parts, and is easily constructed of readily available materials. Variation in delivery volume is easily achieved by varying the volume of the device. The metering device consists basically of a 15-ml conical centrifuge tube that is filled with two siphons and a capillary tube. A diagram and complete specifics for construction and operation are given. Tests indicate that this apparatus is consistently very accurate. (Katz)

J. M. Meneely, and E. S. Merritt.
Available from NTIS, Springfield, Va 22161, as COM-73-10896, Price $3.00 printed copy; $2.25 microfiche. Final Contract Report for National Oceanic and Atmospheric Administration, March 1973. 97 p, 39 fig, 2 tab, 3 ref, 2 append. NOAA Contract 2-35462.

Descriptors: *Remote sensing, *Ocean circulation, *Cloud cover, *Oregon, Currents(Water), Clouds, Oceanography, Fog, Satellites(Artificial).
Identifiers: Upwelling(Oceanography).

Upwelling of subsurface water along the central Oregon coast was studied by analysis of satellite-observed cloud patterns. Sea-surface temperature distributions were compared with observed cloud patterns for a major upwelling event in late August 1972. Both the region of coldest water and the coastal fog band tended to broaden toward the south, but the temperature value could not be directly related to the extent of the fog area. A persistent, eddy-like feature was observed in the sea-surface temperature distribution, but it appears that such small-scale irregularities in the temperature field do not in themselves produce visible cloud features except in the case of thin shallow fog. The duration of the nightime land breeze and the strength of the daytime northerly wind component appear to play major roles in determining whether or not coastal fog occurs during the day. The onset, existence, and cessation of upwelling are related to several recognizable cloud situations. Satellite imagery can provide a basic tool for monitoring upwelling off Oregon. (Knapp-USGS)

WAVE ENERGY CONVERTER ARRAY,
Laitram Corp., New Orleans, La.
J. M. Lapeyre.
U.S. Patent No 3,818,703, 5 p, 7 fig; 4 ref; Official Gazette of the United States Patent Office, Vol 923, No 4, p 1286, June 25, 1974.

Descriptors: *Patents, *Waves(Water), Equipment, Gravity waves, Ocean waves.
Identifiers: *Wave energy, *Power sources, *Energy sources.

The apparatus for converting the energy of surface waves in a liquid such as an ocean, comprises an array of buoyant helical members mounted for rotation about an axis. The pitch of the helical members equals or is greater than the length of the expected waves and the members are floated on the surface with their axes oriented so that wave length of the waves matches the pitch of the helices times the cosine of the angle between the helical axes and the direction of wave propagation. In one embodiment the array is a large chevron formed of two groups of helical members and is pivotable about the apex of the chevron. In another embodiment the helical members are arranged in zig-zag fashion. Means are provided for adjusting the angles between the arms of the chevron in the one case, and the adjacent arms of the zig-zag in the other case. The helical members can be coupled to one or more driven systems, such as electrical generators or friction boilers. (Sinha-OEIS)

INTRODUCTION TO BASIC REMOTE SENSING FOR ENGINEERING GEOLOGISTS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
P. J. Tarkoy.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-224 754; $4.75 in paper copy, $2.25 in microfiche. June, 1971. 169 p, 13 fig, 10 tab, 305 ref, append.

Descriptors: *Remote sensing, Cameras, Electromagnetic waves, Exploration, Geophysics, Instrumentation, Photography, Films, Polarity.
Identifiers: *Electromagnetic radiation, Microwave, Radiometers, Scanners, Electromagnetic spectrums, Polarization, Bands.

The object is to present a technical discussion of the theory of the electromagnetic spectrum and relevance to remote sensors, describe the bands and sensors used in application, and relate how they can be useful in engineering geology and geological exploration. Discussions of each sensor's capabilities, most useful application, and examples of past experiences are also included. Discussed are electromagnetic radiation--its spectrum, interaction with the atmosphere and with geologic materials, its reflections and changes in polarization; photographic spectrum, photographic sensors; procurement of data; non-photographic spectrum; non-photographic sensors--radiometers, scanners, active microwave, passive microwave and other types; and general applications of remote sensors. CALCULATION OF WATER TEMPERATURE OF RIVERS,
Moncton Univ. (New Brunswick). Dept. of Engineering.
N. Marcotte, and V. L. Duong.
J Hydrol (Amst). Vol 18, No 3/4, p 273-287. 1973. Illus. English summary.
Identifiers: *Canada, Rivers, *Water temperature, Chaudiere River(Que), Du Nord River(Que).

Water temperature was calculated at hourly intervals for periods of several consecutive months in Chaudiere and Du Nord rivers, Quebec, Canada. Calculations were made by the thermal budget method using routine meteorological and hydrological observations from nearby stations. Hourly observations of water temperature for 112 consecutive days on Du Nord river were compared with hourly calculated values: the maximum difference is 3.3C, the overall figure is 1.2C and the maximum mean monthly difference is 0.9C. Comparable results were obtained for Chaudiere river. A discussion follows on method, results and differences between the 2 rivers.--Copyright 1974, Biological Abstracts, Inc.

A MINIATURE GRAVITY-FED THERMOCOUPLE PSYCHROMETER,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
S. T. Mitchell, B. A. Kimball, and W. L. Ehrler.
Agron J. Vol 65, No 2, p 238-239. 1973. Illus.

Descriptors: *Hygrometry, *Humidity, Measurement, Instrumentation.
Identifiers: Gravity, *Psychrometer, Thermocouple.

A miniature gravity-fed thermocouple psychrometer was constructed and tested over a wide range of humidities and flow rates. The unit gave accurate wet bulb depression in 6-mm flow tubes through an acrylic plastic block with a minimum flow rate on only 0.06 m/sec at 35% RH (relative humidity) and of only 0.09 m/sec at 11% RH. The psychrometer also agreed exactly with a standard psychrometer (Assmann type) in open air without forced ventilation or radiation shielding.--Copyright 1973, Biological Abstracts, Inc.

HYDROLOGIC DATA FOR LITTLE ELM CREEK, TRINITY RIVER BASIN, TEXAS, 1972,
Geological Survey, Austin, Tex.
B. B. Hampton.
Open-file report, May 1974. 74 p, 2 fig, 3 tab.

Descriptors: *Basic data collections, *Small watersheds, *Texas, *Rainfall-runoff relationships, *Hydrologic data, Streamflow, Data collections, Stream gages, Discharge(Water), Storm runoff.
Identifiers: *Little Elm Creek(Tex).

Rainfall, runoff, and storage data were collected during the 1972 water year for the 75.5-square-mile area above the stream-gaging station Little Elm Creek near Aubrey, Texas. The investigation is scheduled to continue through a period of both above- and below-normal precipitation to define the various factors used in the analyses of rainfall-runoff relationships. The stream has mostly a straight course, although in detail it is distinctly sinuous, with old channels, cutoff meander loops, and the remnants of several oxbow lakes present in the lower reach. The stream has a wide flood plain in the lower half of the watershed. The climate of the study area is temperate and subhumid. (Knapp-USGS)
W74-12055

WATER RESOURCES OF THE POWDER RIVER BASIN AND ADJACENT AREAS, NORTHEASTERN WYOMING,
Geological Survey, Washington, D.C.
W. G. Hodson, R. H. Pearl, and S. A. Druse.
Hydrologic Investigations Atlas HA-465, 1973. 4 sheets, 9 fig, 11 tab, 4 maps, 70 ref.

Descriptors: *Water resources, *Wyoming, *Groundwater, *Surface waters, Water quality, Water yield, Data collections, Hydrological data, Streamflow, Hydrogeology, Groundwater basins.
Identifiers: *Powder River Basin(Wyoming).

General information is given concerning the availability and quality of groundwater resources of the Powder River Basin, Wyoming, in a 4-sheet hydrological atlas. The Powder River Basin is a structural and topographic basin bounded on the west by the Bighorn Mountains, on the southwest by the Casper arch, on the east by the Black Hills, and on the south by the Laramie Range and Hartville uplift. Mean annual precipitation decreases basinward from 16.32 inches at Sundance and 15.91 inches at Sheridan to 14.00 inches at Gillette and 11.80 inches at Casper. Potential evaporation is high, especially in the Powder River Basin, and is several times the precipitation; consequently, much snow, surface water, and soil moisture evaporate to the atmosphere. Alluvium along irrigated valleys is recharged in part from irrigation water. Some movement of water between formations probably occurs in the subsurface. Discharge is mainly by evaporation, seepage to springs and lakes, transpiration by plants, and pumpage from wells. Most groundwater development has been for stock and domestic purposes, and wells are usually drilled and developed to supply water sufficient for these needs only. The quality of groundwater ranges from good to highly mineralized. Dissolved solids can be expected to be less than 100 mg/l in water from igneous and metamorphic rocks of Precambrian age and from intrusive igneous rocks of Tertiary age. The average rate of discharge per square mile is shown on a map for each station. The yields from the nonmountainous drainage basins (Belle Fourche River, Cheyenne River, and the southern and eastern parts of the Powder River Basin) generally are less than 0.05 cfsm (cubic feet per second per square mile), and from the mountain stations generally are more than 0.3 cfsm. Discharge from streams in the nonmountainous areas is greatly affected by storage in stockwater reservoirs and by the variable pattern of thunderstorm activity over the area. (Knapp-USGS)

REMOTE CONTROL OF A WATER SYSTEM USING AN ON-LINE MINI COMPUTER,
East Worcestershire Waterworks Co. (England).
R. H. Burch, and K. C. Marlow.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 251-264, 25-27 September 1973. 5 fig, 1 tab.

Descriptors: *Water resources, *Remote control, *Computers, *Water works, *Telemetry, *Monitoring, Operation and maintenance, Communication, Data processing, Regions.
Identifiers: England.

The factors which have created the need for telecontrol in the East Worcestershire Waterworks Company area of 300 square miles are given, together with a summary of the original specification. A detailed description of the system follows and includes the communication system, the configuration of a typical out-station, the form of the central control and the function of the software. The system was commissioned in 1970 and the operational experience that has been gained since then is discussed. The paper concludes with some general observations and a hint of possible future development. (See also W74-12107) (Bell-Cornell)

A CASE STUDY OF THE SUSSEX/KENT RIVER AUTHORITIES' INTEGRATED HYDROMETRIC DATA PROCESSING SYSTEM,
Sussex River Authority (England).
P. F. Drake.
In: Computer Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 1-4, 25-27 September 1973. 1 fig.

Descriptors: Computers, *Data processing, *River basin commissions, *Hydrometry, Water resources development, Water balance, Design, Hydrologic data, Rainfall, Computer programs, River flow, Planning, Management.
Identifiers: Information, *United Kingdom.

The increase in the volume of data and in the complexity of processing and the lack of available suitable staff prompted the Sussex River Authority, in 1968, to consider the use of computers to assist its efficient functioning. The Kent River Authority Engineers Department became a limited liability partner. Work began with a review of the possible areas of application in the technical departments of both Authorities. It became evident that emphasis must be upon water resources rather than on engineering. The approach adopted was to concentrate the Authorities' resources on one area and to insure this being done as thoroughly as possible. Developed was the objective to be able to produce a regular Water Balance sheet for any area on or under the ground. The flow of information necessary for making up a Water Balance is shown diagramatically. Outlined are the design criteria adopted for a proposed family of integrated, free-standing, self-contained computer systems. The first system that was programmed, a Rainfall System, is discussed. Discussed also are organizational developments, the Water Resources Board involvement, and a proposed flow system. (See also W74-12107) (Bell-Cornell)

STREAM FLOW CHARACTERISTICS OF: GREENBRIER RIVER SUB-BASIN,
West Virginia Dept. of Natural Resources, Charleston.
M. S. Baloch, E. N. Henry, and W. H. Dickerson.
June 1969. 95 p, 41 fig, 23 tab.

Descriptors: *West Virginia, *Watersheds(Basins), *River basins, Streamflow, Large watersheds, Floods, Hydrology, Rivers, Runoff, Surface waters, River flow, Low flow, Natural flow, Average flow, Low-flow frequency, Flood recurrence interval, Flow duration, Flow rates, Flow characteristics.
Identifiers: *Greenbrier River Sub-basin(W Va).

Streamflow data in summary form for five gaging stations were presented. Data included extremes of high and low flows, flow durations and estimates for the frequency or return period for given flows. Greenbrier River Basin located in southeastern West Virginia drains 1,656 square miles. The river elevation drops 1,250 ft in a length of 145.7 miles. Annual basin runoff ranges from 10 to 25 inches. The largest runoff occurs in winter and early spring months. (Humphreys-ISWS)

WATER RESOURCES OF WISCONSIN, LAKE SUPERIOR BASIN,
Geological Survey, Washington, D.C.
H. L. Young, and E. L. Skinner.
For sale by USGS, Washington, DC 20242, Price $2.00 per set. Hydrologic Investigations Atlas HA-524, 1974. 3 sheets, 27 fig, 4 tab, 61 ref.

Descriptors: *Water resources, *Wisconsin, Lake Superior, *Hydrologic data, Data collections, Water yield, Groundwater, Surface waters, Water quality, *Maps.
Identifiers: *Lake Superior Basin(Wisc).

Moderate to large quantities of good-quality water are available in much of the Lake Superior basin of Wisconsin, but, in some localities not even small quantities are available. Although groundwater is widespread, more surface water is used. Lake Superior, a vast body of good-quality water, is the main source of surface water. Streamflow is not dependable in some places because of low runoff during drought. Moderate to large flows are available in the St. Louis, White, Nemadji, Bois Brule, and Montreal Rivers. Floods are infrequent, and flood damages are small. Lakes are numerous in some areas of end moraine and outwash. Groundwater is available in moderate to large quantities from two sources: glacial sand and gravel, and sandstones. Both sources can yield more than 500 gpm to wells in some areas, but in a few areas even domestic supplies are difficult to obtain. Small supplies generally can be obtained from lava flows. The quality of both groundwater and surface water generally is good. (Knapp-USGS)
W74-12335

WATER RESOURCES OF WISCONSIN-MENOMINEE-OCONTO-PESHTIGO RIVER BASIN,
Geological Survey, Washington, D.C.
E. L. Oakes, and L. J. Hamilton.
For sale by USGS, Washington, DC 20242, Price $1.75 per set. Hydrologic Investigations Atlas HA-470, 1973. 4 sheets, 25 ref.

Descriptors: *Water resources, *Hydrologic data, *Wisconsin, *Data collections, Basic data collections, Surface waters, Groundwater, Water balance, Surface-groundwater relationships, Water quality, Water utilization.
Identifiers: *Wisconsin River basin(Wis), Menominee River(Wis), Oconto River(Wis), Peshtigo River(Wis).

This 4-sheet hydrologic atlas describes the water resources of the Menominee-Oconto-Peshtigo River basin in Wisconsin. The physical settings, availability, distribution, movement, quality, and use of water are discussed. This atlas is one of a series of 12 river-basin studies designed to describe in general terms the water resources of the State. The basin is bounded by the surface-water divides of the Wisconsin, Wolf, and Fox Rivers, the Wisconsin-Michigan boundary along the Brule and Menominee Rivers, and Lake Michigan (Gree Bay). Large amounts of good quality water are available. The surface water withdrawal in the basin is three times that of groundwater. Ninety-three percent of the surface water used in the basin is for industrial purposes. Non-withdrawal uses of surface water are for power generation, recreation, and wildlife habitat. Groundwater is used for most community, rural, and industrial supplies. Groundwater is available from sand and gravel deposits and sedimentary bedrock. Domestic and stock supplies are availa-

ble everywhere in the basin. The sandstone and sand and gravel aquifers commonly yield more than 500 gpm to wells. Most areas in the basin have adequate supplies of water available for growth and development. Water problems are minor and are related primarily to water quality. Both groundwater and surface water have high hardness; high iron content is a local problem in groundwater. Reaches of some streams are polluted by industrial or municipal wastes. Saline water occurs in the sandstone aquifer near Marinette and locally in the crystalline aquifer. (Knapp-USGS)

Identifiers: Ellington(Conn), *Bedrock surface map.

Contours show the altitude of the bedrock surface in the Ellington Quadrangle, Connecticut. The position of the contours is based largely on data from wells and test holes, a surficial geology map, and a bedrock geology map supplemented by knowledge of the geologic history of the region. The map shows the configuration of the bedrock surface if all unconsolidated earth materials were removed. (Knapp-USGS)
W74-12631

MAP SHOWING AVAILABILITY OF GROUNDWATER, WARREN QUADRANGLE, MASSACHUSETTS,
Geological Survey, Boston, Mass.
C. J. Londquist.
Miscellaneous Field Studies Map MF-541 E, 1974. 1 sheet, 1 map, 4 ref.

Descriptors: *Groundwater, *Water yield, *Massachusetts, Hydrogeology, Aquifer characteristics, *Maps, Water wells.
Identifiers: Warren(Mass).

Availability of water from unconsolidated deposits in the Warren Quadrangle, Connecticut is shown by a map. Areas in which most properly developed individual wells can be expected to yield less than 25 gpm have deposits including till, very fine sand, silt, and clay with a variable water-saturated thickness as well as sand, gravel, and interbedded sand and gravel with a water-saturated thickness of 10 feet or less. Areas in which most properly developed individual wells can be expected to yield more than 25 gpm have deposits including fine to very coarse sand, gravel, and interbedded sand and gravel with a water-saturated thickness of greater than 10 feet. Unconsolidated deposits are everywhere underlain by crystalline bedrock. Properly developed individual bedrock wells generally yield less than 20 gpm. (Knapp-USGS)
W74-12632

MAP SHOWING DRAINAGE AREAS, WARREN QUADRANGLE, MASSACHUSETTS,
Geological Survey, Boston, Mass.
C. J. Londquist.
Miscellaneous Field Studies Map MF-541 F. 1974. 1 sheet, 1 map.

Descriptors: *Streams, *Watersheds(Basins), *Drainage area, *Massachusetts, River basins, River systems, Surface waters, Watersheds(Divides).
Identifiers: Warren(Mass).

A map shows stream systems and drainage areas that contribute streamflow to selected sites on streams in the Warren Quadrangle, Connecticut. Drainage areas shown have not been adjusted for the manmade changes in the natural regimens such as storm sewers, diversion dams, canals, and tunnels. (Knapp-USGS)

HYDROLOGIC DATA FOR URBAN STUDIES IN THE AUSTIN, TEXAS METROPOLITAN AREA, 1972,
Geological Survey, Austin, Tex.
E. E. Wehmeyer.
Open-file report, June 1974. 49 p, 3 fig, 1 tab.

Descriptors: *Urban hydrology, *Texas, *Basic data collections, *Rainfall-runoff relationships, Hydrologic data, Rainfall, Streamflow, Urbanization, Storm runoff.
Identifiers: *Austin(Tex).

Hydrologic studies in the Austin urban area, Texas are made to determine the effects of progressive urbanization on infiltration, rates of peak discharge, and rainfall-runoff relations in the Waller Creek watershed. Rainfall and runoff data from the rural Wilbarger Creek watershed are used for comparative purposes in determining the effects of existing and progressive urbanization in the Waller Creek watershed. Rainfall and runoff data are presented for the Waller Creek and Wilbarger Creek study areas for the 1972 water year (October 1, 1971 to September 30, 1972). (Knapp-USGS)

RECENT DEVELOPMENTS IN PREPARING COLORED AGROCLIMATIC MAPS BY COMPUTER,
Department of Agriculture, Ottawa (Ontario).
W. Baier, W. R. Sharp, and J. G. Roberts.
Can J Soil Sci, Vol 53, No 1, p 133-134. 1973.
Identifiers: *Agroclimatic maps, *Computer mapping, *Maps, Seasonal, Soils, Publications.

Digitizing and plotting techniques were improved and combined with standard cartographic and photomechanical procedures to produce waterproofs for checking and negatives suitable for plating and printing for full color publication. These neelopments are described, and a full color sample map prepared from derived data of seasonal water deficits is presented. The computer mapping technique reduced tedious cartographic work usually necessary for the preparation of maps for publication. Besides the time-saving aspect in the preparation of maps for publication, the digitizing of working maps has the additional advantage that the data are on magnetic tapes and therefore available for combination with information from other data banks such as those for soils and plant distribution.--Copyright 1974, Biological Abstracts, Inc.

WHAT'S NEW IN WATER AND SEWER PIPE,
K. A. Godfrey, Jr.
Civil Engineering-ASCE, (American Society of Civil Engineers), Vol 44, No 5, p 72-73, May 1974. 1 fig.

Descriptors: *Tunnel linings, *Sewers, *Steel pipes, *Construction materials, Channels, Concrete, *New York.
Identifiers: *Staten Island(NY), Steel tunnels, Steel channels, Neoprene gaskets.

For a savings of time and money, steel channels were used to line a tunnel for a ten foot OD sanitary sewer in Staten Island, New York. The steel tunnel lining was designed to carry permanent loading, permitting the contractor to hole the tunnel before placing the cast-in-place concrete liner. Wide steel channels (24 inches) were made and welded flange to flange, then pressed to conform to the tunnel shape. The length of the job is 17,000 feet, and is characterized by having a wide segment width of 48 inches to ensure rapid tunneling, and being the first major tunnel in New York City using neoprene gaskets which are factory applied. (Murphy-FIRL)

FIELD AND MODEL STUDIES ON A SILTATION PROBLEM IN THE FRASER RIVER,
Department of Public Works, Vancouver (British Columbia).
E. O. Isfeld, D. Hay, and J. Rossouw.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 44-63, 1973. 7 fig, 3 ref.

Descriptors: *River training, *Sediment control, *Suspended load, Bypasses, Groins(Structures), Flow control, Model studies, Hydraulic models, *Canada.
Identifiers: *Fraser River(Canada).

A siltation problem developed behind a training wall in the Fraser River at New Westminster, Canada. Field and model studies were undertaken to examine remedial measures. The field studies included detailed measurements of suspended load and directional velocity profiles across various sections of the river in the area of the training wall. The model study consisted of two stages. In the first stage, the model bed was fixed and mainly suspended load was studied. In the second stage a movable bed was used and the bedload was studied. Secondary flow developing in the river bend caused flow close to the bed to move towards the left bank, resulting in the high sediment concentration in this area. The water passing over the upstream opening in the training wall was thus heavily loaded with suspended sediment. Due to an increase in width of flow behind the training wall, the influence of the opening extended into the river drawing a higher percentage of flow than the ratio of cross-sectional areas. The widening also resulted in a decrease in flow velocities behind the wall with subsequent settling of suspended material. A remedial measure which permitted some flow through the opening and access for navigation required this secondary flow to be reversed near the opening. The obvious solution was to test groins upstream of the opening which would effect a local reversal in the curvature of the flow. Various schemes were tested in which a groin situated 500 feet upstream of the upstream weir opening in the training wall was varied in length. A large increase in efficiency against sedimentation occurred with increasing groin length up to a length of approximately 370 feet. (See also W74-12087) (Knapp-USGS)
W74-12089

COMPUTERS IN STRUCTURAL DESIGN,
Constructional Industry Research and Information Association, London (England).
L. S. Blake.
In: Computer Uses in Water Systems: Conference Papers, A Water Research Association Conference, University of Reading, England, p 275-281, 25-27 September 1973. 5 ref.

Descriptors: Computers, *Structural design, *Analytical techniques, *Computer programs, *Optimization, Water resources, Projects, Systems analysis.
Identifiers: *Detailing.

The background to the involvement of computers in structural design is discussed briefly together with the comparatively recent application to the potentially more profitable area of detailing. The problems facing the structural designer are used to establish the context in which computer design is applied. Outlined are the development of analytical methods and the results of a number of projects in which such methods have been subjected to experimental verification. The area of optimization in design is investigated and references are made to particular optimizing models. Design aids, such as the LUCID system, which are distinct from optimizing programs are discussed, and the paper concludes with a prediction as to the direction in which the whole area could reasonably be expected to develop during the next ten years. APPLICATION HYDROLOGIC AND HYDRAULIC RESEARCH TO CULVERT SELECTION IN MONTANA, VOLUME 1, REPORT,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
E. R. Dodge.
Available from NTIS, Springfield, Va 22161 as PB-220 093, Price $3.00 printed copy; $2.25 microfiche. Final Report to Montana Department of Highways, Helena, Planning and Research Bureau, September 15, 1972. 105 p.

Descriptors: *Design flow, *Design flood, *Frequency analysis, *Montana, *Culverts, Highways, Roads, Design data, Hydraulic structures, Flood recurrence interval, Synthetic hydrology.

A regional streamflow frequency analysis was performed, involving both natural and synthetic streamflow records, to estimate flood magnitude of various recurrence intervals for each of 230 Montana watersheds. Using regression analysis, flood peak prediction equations for the 2-, 5-, 10-, 25- and 50-year recurrence intervals were developed fr each of 9 contiguous geographic regions in Montana. These equations predict the flood peak as the product of powers of various hydrologic watershed parameters. A detailed discussion of the hydraulic conditions which occur for various types of culvert flow is presented along with modern criteria and methods for culvert selection. (Knapp-USGS)

Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, 1973. 672 p.

Descriptors: *Hydraulics, *Conferences, *Canada, Streamflow, Rainfall-runoff relationships, Open channel flow, Groundwater movement, Mathematical models, Simulation analysis.

The Canadian Hydraulics Conference provides a forum for the exchange of ideas among Canadian hydraulic engineers. The first conference, in 1973, was attended by 165 registered participants. The topics discussed in the first conference were river engineering, hydraulic aspects of pollution, numerical models, and structures. (See W74-12088 thru W74-12106) (Knapp-USGS)
W74-12087

BACKWATER EFFECTS AT END-DUMPED CONSTRICTIONS ON ALLUVIAL CHANNELS,
Directorate of Designs, Irrigation, Bhubaneswar (India).
B. P. Das, and J. B. Nuttall.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 30-43, 1973. 7 fig, 11 ref. NRC Grant A4334.

Descriptors: *Backwater, *Alluvial channels, *Open channel flow, Flow around objects, Scour, Froude number, Deflection, Abutments, Canada.
Identifiers: *Channel constrictions.

The most common method of restricting a river channel is by end-dumping fill material from one or both banks. Backwater rise due to a dumped constriction depends on the Froude number of the undisturbed flow and the shape of the constriction. Constriction shape in turn depends on interaction between the bed, the dumped material and the flow and on the method of placement. The backwater rise for end-dumped constrictions at equilibrium scour depends on material and flow properties. A 7.5-foot-wide flume, 60 feet long, with a maximum flow of 3 cfs was used for tests. Bed material 1.5 feet thick was placed over a length of 50 feet. Tests were run at three Froude numbers, 0.50, 0.29, and 0.10. The corresponding uncontracted normal depths were 0.18, 0.26, and 0.38 feet, respectively. With these depths the maximum scour was limited to 1.5 feet, the depth of the bed. Maximum backwater rise on an alluvial bed is much less than for a rigid bed. The effect of bed material size is of relatively little significance. (See also W74-12087) (Knapp-USGS)

FLOW CHARACTERISTICS OF THE OUTLET CHANNELS OF LAKE WINNIPEG FOR NATURAL AND REGULATED CONDITIONS,
Manitoba Hydro.
D. J. Phelps, and R. W. Coley.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 77-95, 1973. 9 fig, 12 ref.

Descriptors: *Discharge measurement, *Flow characteristics, *Lakes, *Open channel flow, Regulated flow, *Canada, Outlets, Regulation, Stage-discharge relations, Flow measurement, Gaging stations.
Identifiers: *Lake Winnipeg(Canada).

The method utilized by Manitoba Hydro to analyze the Nelson River flows through the outlet channels of Lake Winnipeg is described. Lake Winnipeg outflow relationships were developed for natural and for improved and controlled conditions. Flow distribution and water surface profiles were computer through an intricate chain of natural channels controlled by a series of rapids and falls, mildly sloping lakes, and excavated channels, for both open water and ice conditions. Hydrometric surveys, simulation of rapids and falls (natural weirs), and determination of channel bed and ice roughness are described. Analytical flow charts are included. (See also W74-12087) (Knapp-USGS)

RESISTANCE TO FLOW IN ICE COVERED RIVERS--A SIMULATION STUDY WITH ARTIFICIAL ROUGHNESS,
New Brunswick Univ., Fredericton.
K. S. Davar, and E. S. M. A. Ismail.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 107-128, 1973. 11 fig, 1 tab, 16 ref.

Descriptors: *Streamflow, *Ice cover, *Closed conduit flow, *Flow resistance, Roughness(Hydraulic), Hydraulics, Hydraulic models, Model studies.
Identifiers: Ice-covered rivers.

Resistance to flow under ice was studied in a rectangular conduit with relatively large roughness elements at the top, of various sizes and spacings, as may occur in an ice covered channel. The measured velocity profiles did not conform to the normal logarithmic velocity profiles for turbulent flow. (See also W74-12087) (Knapp-USGS)

LABORATORY STUDY OF SCOUR AT CHANNEL BENDS,
Research Council of Alberta, Edmonton.
B. A. Nwachukwu.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 144-164, 1973. 7 fig, 2 photo, 3 tab, 14 ref.

Descriptors: *Scour, *Meanders, *Alluvial channels, Sediment transport, Stream erosion, Vortices, Turbulent flow, Hydraulic models, Flumes.

To define the location of maximum depth of scour in channel bends, laboratory tests were conducted to find the relationship between maximum depth of scour, bend geometry and flow variables. The bed material consisted of sand having a median sieve diameter of 0.35 mm. Graphs are presented showing the variation of the ratios of maximum to mean depth with deflection angle, curvature ratio, depth/width ratio and Froude number. Besides the curvature it was found that flow condition and deflection angle could be significant parameters affecting the maximum depth at bends. (See also W74-12087) (Knapp-USGS)

INTERFACILA SHEAR STRESS IN DENSITY WEDGES,
Canada Centre for Inland Waters, Burlington (Ontario).
T. M. Dick, and J. Marsalek.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 176-191, 1973. 3 fig, 1 tab, 2 ref.

Descriptors: *Stratified flow, *Density stratification, *Shear stress, *Saline water-freshwater interfaces, Saline water intrusion, Path of pollutants, Mixing.
Identifiers: *Density wedges.

When a fluid flows into another fluid of different density, stratification may occur and a distinct interface may be formed. As the interface is usually sloping the phenomenon is often called a density wedge. Various methods for the estimation of the interfacial shear stress coefficient in density wedges were examined to determine the significant parameters and the best method for computing the coefficient for practical purposes. An interim procedure is suggested which gives consistent results over a wide range of Reynolds numbers and different wedge types. The interfacial shear stress may be estimated from the Moody diagram for pipe flow by taking the hydraulic values as the new depth of the bottom layer and assumes the relative roughness as 'smooth'. NUMERICAL MODEL STUDIES OF RIVERS AND ESTUARIES,
National Research Council of Canada, Ottawa (Ontario). Hydraulics Lab.
N. Crookshank.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p315-336, 1973. 7 fig, 3 ref.

Descriptors: *Numerical analysis, *Finite element analysis, *Rivers, *Estuaries, *Mathematical models, Model studies, Canada, Streamflow, Path of pollutants, Design.

Numerical hydrodynamic modeling of rivers and estuaries in one and two dimensions is reviewed. The accuracy is considered sufficient for most engineering purposes. Applications to the St. Lawrence, Fraser and St. Clair Rivers are discussed. The formulation of a model involves the representation or schematization of the physical geomorphology by discrete sections. Rivers may be represented by lengthwise sections in one dimension while wide estuaries are better represented by a rectangular grid in two dimensions. The physical equations which describe the flow are then solved for finite increments both in time and space by numerical methods that are efficient and economical. (See also W74-12087) (Knapp-USGS)

N. Zaghloul, and J. A. McCorquodale.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University water Resources Center Publication No 4, p 355-368, 1973. 10 fig, 8 ref.

Descriptors: *Scour, *Mathematical models, *Groins(Structures), Flow around objects, Numerical analysis, Stream erosion, Hydraulic structures, Jetties, Flow control, River training.
Identifiers: *Spur dikes.

A mathematical model simulates the scour around spur dikes. Initially a two-dimensional numerical model is used for the flow pattern around a 'sheet' pile dike, utilizing the Reynolds equations with a constant eddy viscosoty. The Reynolds equations are transformed into a Helmholtz vorticity equation and a Poisson type equation. These two equations are solved alternately, by a finite difference technique, to obtain the variations in vorticity and stream function with time. After the flow pattern has become relatively steady, the bed is allowed to erode and the stream function is redefined in terms of a depth averaged velocity. A bed shear function is computed from the local velocity, turbulence and vorticity. Finally, the difference between the local shear and local bed resistance is reduced to zero by adjusting the local depth. (See also W74-12087) (Knapp-USGS)

A COMPUTER SIMULATION OF THE MOTION OF A SOLID PARTICLE IN A TURBULENT FLOW WITH FREE SURFACE,
Canada Centre for Inland Waters, Burlington (Ontario).
B. G. Krishnappan.
In: Proceedings of Canadian Society for Civil Engineering 1st Canadian Hydraulics Conference, Alberta University, Edmonton, May 10-11, 1973: Alberta University Water Resources Center Publication No 4, p 435-450, 1973. 5 fig, 10 ref.

Descriptors: *Sediment transport, *Turbulent flow, *Open channel flow, *Simulation analysis, Suspended load, Settling velocity, Turbulence.

The random motion of a solid particle in a two-dimensional and uniform turbulent flow in open channels was simulated using a computer. The simulation is based on the hypothesis that the solid particles are dispersed, essentially in the same manner as 'fluid lumps' except that the solid particles continuously sink relative to fluid lumps. A normal function (Gaussian curve) was used as the probability density distribution for the random vertical position of the particle at any instant. (See also W74-12087) (Knapp-USGS)

COMPUTER AIDED ECONOMIC DESIGN OF WATER DISTRIBUTION SYSTEM,
University Coll., London (England). Dept. of Civil Engineering.
A. K. Deb.
In: Compueter Uses in Water Systems: Contributed Papers. A Water Research Association Conference, University of Reading, England, p 75-78, 25-27 September 1973. 4 equ, 4 ref.

Descriptors: *Water distribution(Applied), *Networks, *Design, *Pipes, Hydraulics, *Optimization, *Economics, Water supply, Valves, Pressure head, Pumping Reservoir storage, Hazen-Williams equation, Pipe flow, Digital computers, Systems analysis, Mathematical models.
Identifiers: *Cost minimization.

The complexity of deriving the optimum cost solution for a water distribution system is explained. Considering the initial costs of pipes, pumps and elevated service reservoir, and maintenance and power cost, a method to obtained optimum pressure surface, inlet hydraulic head and position of the service reservoir has been proposed. The method of analysis gives the workable minimum cost pipe sizes of a network of given inflows, outflows and hydraulic pressure surface over the network. A pipe network system solved to illustrate the validity of the approach is discussed. Results showed a 33% saving in cost when the elevated reservoir was located at the center of the network. The effect of population density on cost saving is mentioned. A high speed digital computer is necessary in order to use this optimization method for least cost solution of a water distribution network. (See also W74-12107) (Bell-Cornell)

PROBLEMS ENCOUNTERED IN DRILLING AND COMPLETING DEEP WELLS,
B. A. Eaton.
Society of Petroleum Engineers of AIME Preprint SPE 3662, 1971. 8 p, 10 fig, 1 tab, 15 ref.

Descriptors: *Drilling, *Deep wells, Exploration, Oil industry, Oil wells, Gasses, Statistics, Planning, Pore pressure, Data collection, Boreholes, Mud, Cement, Temperatures.
Identifiers: *Exploration wells, Surface hole, Intermediate hole, Hole below intermediate casing, Fracture pressure curves, Rigs, Wildcat well drilling.

Problems encountered in drilling and completing wells to 15,000 feet and below are reviewed. Statistical trends in deep well drilling indicate that increasing numbers of such wells will be drilled each year. Problems associated with this activity are similar to those of past shallow drilling. However, these problems are more severe and much more expensive than those in the past. The role of a drilling coordinator, with regard to the development of sound, workable drilling plans, is discussed. A method of well planning is presented that, if used, will reduce the frequency of expensive problems in deep drilling. One problem involves the attempted completion of wells drilled below depths where commercial production is extremely unlikely to be found. A means of avoiding this problem is also discussed. A great majority of drilling and completion problems could be eliminated by better planning, and better trained on-site rig supervisors carrying out previously agreed upon well plans. (Campbell-NWWA)

FACTORS AFFECTING DESIGN, DEVELOPMENT AND COST OF WELLS,
Universal Oil Products, St. Paul, Minn. Johnson Div.
J. L. Mogg.
Johnson Drillers Journal, p 1-3, May-June, 1973. 1 tab.

Descriptors: Aquifer characteristics, Test wells, *Groundwater, Drilling, Pumping, Testing, Water wells, Sampling, Specific capacity, Well data, Screens, Casings, Costs, Drawdown, Cost analysis, Drillers logs, Drilling equipment.
Identifiers: *Mini-well, Pilot hole, High-velocity horizontal-jetting tool.

Modern practices of well design permit designers to follow clearly understood, orderly and relatively simple steps to design a successful well with confidence. These steps can be stated as follows: Drilling a pilot hole (4-6 inches in diameter) and often converting the pilot hole into a Mini-Well. From the pilot or test hole, as it is sometimes called, the location, thickness, and character of the aquifer (or aquifers) is obtained. Using inexpensive geophysical equipment, the driller's log can be verified with either an electric or gamma-ray log. Portable, easily operated equipment for making either type of log can be purchased for less than $2,500, consequently the cost of making the log is small. The results of pumping the Mini-Well provides specific capacity data that used in conjunction with the geometry of well and aquifer permits an accurate prediction of the maximum yield of a large capacity well constructed at the site. THE COST OF GEOPHYSICAL EXPLORATION.
Water Well Journal, Vol 28, No 8, p 44-46, August, 1974. 2 fig.

Descriptors: *Bore hole geophysics, Logging(Recording), Electrical well logging, Exploration, *Costs, *Groundwater, Rural areas, Drilling, Drillers logs, Electrical resistivity, Instrumentation, *Exploration.
Identifiers: *Geophysical exploration, National Demonstration Water Project, Rural water, Groundwater development, Geophysical methods.

The value of geophysics in groundwater exploration and development has been profoundly demonstrated. Unfortunately, the cost of using geophysical techniques has usually been quite high. Thus geophysical aids to groundwater development have mainly been restricted to large budget projects where its use could be economically justified. This situation has been unfortunate in that many smaller, low budget projects, especially those requiring maximum economic efficiency, could greatly benefit from geophysical techniques. Within recent years, however, advances in solid-state electronics have made possible the development of low cost, portable geophysical instruments. Many of these instruments were designed specifically for use in groundwater exploration and development. Their use permits smaller projects to enjoy the benefits of geophysical techniques. One such small project was a National Demonstration Water Project near Logan, West Virginia. Geophysical techniques do not guarantee success, but rather serve to locate the site(s) in a given area that offer the most potential for ground water development. The value of the geophysical methods employed was demonstrated. The collection of additional subsurface information aids in the development of a ground water supply, especially for small water systems in which an expensive and laborious test well drilling program is neither economically possible nor practical. WATER SYSTEM OPERATOR NEEDS BASIC INFORMATION TO KEEP PUMPS WORKING, PART II,
Johnson Drillers Journal, p 2-4, May-June 1974. 5 fig, 1 tab.

Descriptors: Water wells, *Groundwater, Specific capacity, Water supply, *Well data, Water works, *Hydraulic structures, Equipment, Turbines, Pump turbines, Pumps, Pressure, Pressure head, Drawdown, Water pollution, Head, Head loss, Centrifugal pumps, *Operations.
Identifiers: *Community water systems, *Water system operators, Well performance, Records, Head-capacity curve, Dynamic head, Contamination.

About 80 million people in the United States are served by community water systems that draw upon groundwater sources. In addition, it is estimated that individual wells supply water to 30 million more persons. Water from good wells, particularly those tapping waterbearing sand formations, is usually of high bacteriological quality, but contamination can occur after delivery into the distribution system. A water well loses capacity slowly over a period of months or years. Usually, there is ample time to detect any deterioration and to plan corrective measures. The operator can select the best time to do the work during the season, day or time of day when there will be the least effect on service to the customer. To accomplish this, it is essential to have records that show trends in well and aquifer performance. The water system operator can use the history to diagnose the cause of a problem or to predict the probable occurrence of a problem. The owner of a system, and his customers, stands to benefit from accurate diagnoses. Benefits accrue in dollars saved and in service rendered. Some signs of water well trouble which the operator should watch for are changes in specific capacity and changes in turbine pump output. (See also W74-10103) (Campbell-NWWA)

MEASURING AND USING ROTARY DRILLING TORQUE,
Texaco Research Lab., Bellaire, Tex.
H. A. Rundell.
Oil and Gas Journal, Vol 71, No 20, p 76, 81-82, May 14, 1973. 4 fig, 1 ref.

Descriptors: *Rotary drilling, *Oil industry, Measurement, Drilling, Pipes, Penetration, Gears.
Identifiers: Torque, Bits, *Torquemeter, Rigs, Rotary speed, U.S. patents.

Recordings of torque and rotary speed from the torquemeter can provide valuable information on the degree of wear of the rotary bit during the course of the bit run, and reliable indications of impending bearing failure. More recently, a modification of the torquemeter has been developed. It allows its use on chain-driven rotaries as well. The Texaco torquemeter measures absolute torque by measuring the angular deflection of a portion of the rotary-drive section. The torquemeter is virtually maintenance-free, and has proven extremely durable over several years' use. Torque measurement accuracy is at least 2% of full scale (usually set at 50,000-ft-lb). Greater sensitivity is possible by setting full scale at 25,000-lb-ft. In addition to its immediate utility, the Texaco torquemeter provides a feedback of formation-bit interaction. This may supply the element necessary to allow computer-controlled minimum-cost drilling to become a practical reality. The Texaco torquemeter is covered by pending and issued U.S. patents. ANNULUS-LOSS ESTIMATES CAN BE MORE PRECISE,
P. L. Moore.
Oil and Gas Journal, Vol 71, No 33, p 111-113, August 13, 1973. 2 fig, 2 tab.

Descriptors: Pressure, *Drilling, Circulation, Mud, Drilling fluids, *Groundwater, Drilling equipment, Wells, Coredrilling, Drill holes, Rotary drilling, Pipes, Flow, Equations, Oil industry.
Identifiers: *Annulus loss, *Drill string losses, Standpipe pressures, Surge pressures, Drill collars, Flow patterns, Down-hole measurements.

Annulus pressure loss in a drill string may be determined by reading standpipe pressure directly and subtracting the calculated pressure losses inside drill string and bit. The advantages of this procedure are: (1) The inside measurements of the drill string are more precise than hole-size estimates. (2) Pressure losses through the bit are considered very accurate. (3) Flow patterns inside the drill string and through the bit are generally turbulent, and viscous flow properties have a minor effect on the total pressure loss in this part of the string. (4) Flow patterns in the annulus are generally laminar, and viscous flow properties of the mud affect pressure losses substantially. Disadvantages of using the procedure are: (1) Most of the pressure loss in the circulating system occurs inside the drill string and through the bit. So a 5% error in these calculations would result in a potential 30 to 40% error in determination of total annular pressure losses. (2) The procedure is limited to a determination of total annular pressure losses, and the point of interest is very often just below the last casing seat to the surface, not from total depth to the surface. Accuracy of annulus pressure-loss equations is limited because the flow properties of the mud must be measured at a given surface temperature. And these measurements are used in the equations. (Campbell-NWWA)

HIGH-PRESSURE DRILLING,
W. C. Maurer, J. K. Heilhecker, and W. W. Love.
Journal of Petroleum Technology, Vol 25, No 7, p 851-859, July, 1973. 18 fig, 2 tab, 15 ref.

Descriptors: *Drilling, Data, Oil wells, Laboratory tests, High pressure, Sedimentary rocks, On-site tests, Economics, *Oil industry, *Texas.
Identifiers: *Novel drills, Lasers, Electron beams, Erosion bits, High-pressure roller bit tests, Rigs, High-pressure triplex pump.

A survey has been made of more than 25 novel drills, and drilling rates were predicted for each of these drills in oil wells on the basis of available laboratory drilling data. Novel drills that thermally spall rock were found to have limited potential for drilling oil wells because most sedimentary rocks will not spall. Devices such as lasers and electron beams had extrapolated drilling rates of less than 1 foot/hour because of the high energy requirement for fusing rock. Research was begun to further evaluate high-pressure bits for oil-well drilling. The following conclusions were reached: (1) A threshold nozzle pressure must be exceeded before high-pressure bits will erode rock rapidly. (2) Conventional triplex mud pumps can be equipped with high-pressure fluid ends to provide low-cost,

reliable, high-pressure pumps. (3) A 2-inch diameter erosion drill operating at pressures up to 13,500 psi drilled Carthage marble at 180 feet/hour, Indiana limestone at 280 feet/hour, and Berea sandstone at 320 feet/hour. (4) Full-scale high-pressure roller bits operating at pressures of 10,000 to 15,000 psi can drill most rocks two to three times faster than conventional roller bits. (5) High-pressure bits have a potential for producing significant savings in drilling costs, especially in high-cost areas such as deep land wells, offshore wells, or arctic wells. (Campbell-NWWA)

THE APPLICATIONS AND LIMITATIONS OF DEEP DRILL STEM TESTING,
P. J. Zecchi, and B. J. Scott.
Society of Petroleum Engineers of AIME Preprint SPE 3907, 1972. 9 p, 8 fig, 3 tab, 10 ref, append.

Descriptors: Planning, *Deep wells, Boreholes, *Test wells, Mud, Geologic formations, Equipment, Data, Temperature, Pressure, Sealants, Strength of materials, Drilling fluids, Safety factors, Oil industry, *Texas, *Oklahoma.
Identifiers: *Drill stem testing, Open hole testing, Cased hole testing, Ultra deep wells, Andarko Basin(Tex-Okla), Delaware Basin(Tex), Annulus pressure, Pretest planning, Differential pressures.

A review is presented of the techniques currently utilized in deep well drill stem testing. The procedures for both open hole and cased hole testing are presented with particular emphasis on the problems and existing solutions to these problems. Data from actual drill stem tests in the Anadarko Basin of Texas and Oklahoma and the Delaware Basin of West Texas are reviewed. The trend for ultra deep wells, those below 20,000 feet, has been increasing during the past few years. The entire drilling and service industry has been challenged to provide the equipment and expertise to drill the wells, evaluate the formations, and provide mechanical equipment for producing them. Formation evaluation of these deep zones by a drill stem test has been successful, but much planning and innovation was necessary. High pressure and high temperature are two factors that present unusual problems. Particular attention must be paid to drill pipe and tubular goods in all deep drill stem tests. Very high mud weights also have received considerable attention in planning a deep drill stem test. A case is presented to show that all deep wells can be safely evaluated with a drill stem test. Planning is the key word in obtaining a successful drill stem test. (Campbell-NWWA)

PORE-VOLUME COMPRESSIBILITY OF CONSOLIDATED, FRIABLE, AND UNCONSOLIDATED RESERVOIR ROCKS UNDER HYDROSTATIC LOADING,
Chevron Oil Field Research Co., Richmond, Calif.
G. H. Newman.
Journal of Petroleum Technology, Vol 25, No 2, p 129-134, February, 1973. 8 fig, 12 ref.

Descriptors: *Sandstones, *Limestones, Correlations, *Rock properties, *Consolidation, *Compressibility, Sampling, Porosity, Data, Pressure, Reservoirs, Pores, Cores, Hydrostatic pressure, Freezing.
Identifiers: Net pressure, Friable rocks, Reservoir rocks, *Pore-volume compressibility, Hydrostatic loading.

The use of pore-volume compressibility-porosity correlations in engineering calculations is well known. The correlations developed by Hall (1953) for both sandstones and limestones have been widely distributed. Van der Knaap (1959) published a similar correlation using limestone samples from a single well and also correlated the data with net pressure. Such correlations are attractive because of the simple relationship established. However, those correlations were intended only for well consolidated samples; correlations for friable or unconsolidated samples have not been published. This study compares laboratory data with the published correlations of consolidated samples as well as with values for friable and unconsolidated sandstones. The conclusions reached are: (1) The pore-volume compressibility-porosity values obtained are in poor agreement with published compressibility-porosity correlations. (2) Pore-volume compressibilities for a given porosity can vary widely according to rock type. (3) Attempts to correlate the data showed that consolidated sandstones differed greatly from limestones and friable and unconsolidated sands, but the data are too widely scattered for correlations to be reliable. MUD DISPLACEMENT WITH CEMENT SLURRIES,
C. R. Clark, and L. G. Carter.
Journal of Petroleum Technology, Vol 25, No 7, p 775-783, July, 1973. 13 fig, 3 tab, 14 ref.

Descriptors: *Cements, *Muds, Drilling, Drilling fluids, *Slurries, Equipment, Shear stress, Shear strength, Groundwater, Interfaces, Pressure, Pipes, Drag.
Identifiers: Annular space, Displacement, Down-hole environment, Driving forces, Resisting forces, Test cells, Cement/mud interface.

One prerequisite for successful primary cementing is the complete displacement of drilling mud from the annular space. Even after proper techniques for maximum mud displacement efficiency are applied, mud displacement efficiency often remains low. The objective was to re-examine, under conditions closely simulating the down-hole environment, the relative importance of the driving forces available to displace drilling mud from the annulus. The following conclusions were drawn: (1) Pipe movement, either rotation or reciprocation, is a major driving force for mud removal. (2) A well conditioned mud greatly increases mud displacement efficiency. (3) Pipe centralization significantly aids mud displacement. (4) The buoyant driving force resulting from cement-mud density difference has less effect on mud displacement than expected under conditions simulating the down-hole environment. (5) Drag stress at the cement/mud interface can be a significant driving force for mud removal when the cement slurry is in turbulent flow in some part of the annulus. (6) Pipe motion with scratchers substantially improves mud displacement, especially in areas of hole enlargement. (Campbell-NWWA)

8G. Materials

CLEANING WATERMAINS USING POLYURETHANE SWABS.
Water and Pollution Control, Vol 112, No 5, p 34-36, May 1974. 4 fig.

Descriptors: *Pipes, *Cleaning, *Water pressure, *Hydrants, *Canada, Municipal water, Drainage, Bacteria, Disinfection, Hydrogen ion concentration.
Identifiers: *Polyurethane, *Water mains, Compression, Toronto, Swabs, Mains.

A watermain near Toronto, Canada, was cleaned by forcing a polyurethane foam swab through the main via regular water pressures. First, the main valves were closed to isolate the section; the swab was inserted into the top of a compression-type hydrant which had its internal workings previously removed. Water pressure from a fire hose on the hydrant supplied the pressure while the nearest main valve was opened and the swab moved at 100 feet per minute to an open hydrant at the far end of the line. The chance of a swab becoming lodged in a main is small, and can be corrected by a reverse flow. Insertion of the swab is not difficult; most of Ontario's hydrants are of the compression type. For small mains up to 10 inches in diameter there is no problem--it is necessary, however, to ensure the plugging of drain holes. The greatest need for

swabbing is commonly at municipalities using low pH surface water supplies where filtration treatment is not provided. Removal of detritus by swabbing may be condusive to bacterial growth, and swabs are often treated with disinfectant. (Murphy-FIRL)

ANALYSIS OF ELECTRICAL RESISTIVITY MEASUREMENTS OF SHALLOW DEPOSITS,
Iowa State Univ. of Science and Technology, Ames.
D. W. Tarman.
MSc thesis 1967. 96 p, 22 fig, 1 tab.

Descriptors: *Electrical resistance, Data collections, Surveys, Groundwater, Hydrologic data, Borehole geophysics, Exploration, Subsurface investigations, Till, Alluvium, Glacial drift, Deposition(Sediments), *Iowa, *Measurement.
Identifiers: Wenner method, *Gish-Rooney method, Subsurface materials.

This study was undertaken to analyze several interpretative methods applicable to electrical resistivity data obtained from a geologic setting characteristic of central Iowa. The widespread occurrence of glacial drift in the region requires that data be obtained in ways other than from bedrock exposure. Methods available are borehole investigations, correlation between isolated outcrops and geophysical methods. Of the geophysical methods the electrical resistivity method is, potentially, the fastest and most inexpensive. A resistivity survey was conducted over a preestablished grid on a till covered area and over a series of cross sections in a small alluvium filled valley. The nature of the subsurface materials in both areas was determined through borehole investigations. The resistivity data were analyzed and the values compared to the geologic control. Results indicate that the Gish-Rooney method of continuous depth plotting gives depths which compare most favorably with the geologic control. (Campbell-NWWA)

USE OF ORGANIC POLYMER DRILLING FLUID IMPROVES CORE DRILL EFFICIENCY.
Johnson Drillers Journal, p 1, 13, May-June, 1974.
Identifiers: Revert, Organic polymers, Subsurface formations, Split-tube sampling, Drive-core sampling.

It takes more than just clay and water to make an engineered drilling fluid system. In fact, the best drilling fluid for some types of subsurface formations and some methods of drilling will not contain any clay--the clay being replaced by an organic polymer. Revert finds special application in core-drilling operations. It is easily mixed at the drill site by being sprinkled into the water and recirculated through the pump. Since only a small quantity is required, transport costs are virtually negligible. Numerous interrelated factors affect the cost and results of drilling operations. These include: nature of the formations to be penetrated; capabilities and limitations of drilling equipment; skill, experience and attitude of the drilling crew; accessibility of the job site and cost of transporting materials to the site. Pros and cons of various types of drilling fluids are discussed. Improved core recovery, less hole trouble, and savings in time and materials can be expected when the drilling fluid is carefully considered in the overall plan for test drilling. (Campbell-NWWA)

HOW TO DIAGNOSE A THIEF ZONE,
Continental Oil Co., Ponca City, Okla.
M. Felsenthal.
Journal of Petroleum Technology, Vol 25, No 7, p 839-840, July, 1973. 1 fig, 1 ref.

Descriptors: *Injection wells, *Tracers, Liquids, *Equations, Permeability, Flow, Pressure, Oil wells, Viscosity, Porosity, *Groundwater, Tests, Formulation, Oil industry.
Identifiers: *THIEF zone, Producing wells, Fractions, Waterfloods.

Discussed is a classical method for determining the time required for tracer-tagged liquids to flow from injection wells to producing wells that was formulated by J. C. Calhoun (1953). This method can also be used for evaluating the permeability of the most conductive layer of the formation. This layer may be a 'thief' zone that ought to be closed by subsequent remedial action. Calhoun's method of analysis is time consuming because it involves either a graphical integration or an approximation using a summation of terms. A simpler method was developed that achieves the same purpose with much greater speed and with sufficient accuracy. The method is based on a model of two radial-flow regimes. Radial flow emanates from the injection well, which acts as a 'source,' and converges in the producing well, which acts as a 'sink.' The simpler method was found to be just as effective when using data from a waterflood. The difference in results by the two methods was not considered to be significant for the purposes of the tracer test. (Campbell-NWWA)

A REVIEW OF CORROSION MONITORING TECHNIQUES,
Fincher, D. R. and Nestle, A. C.
D. R. Fincher, and A. C. Nestle.
Society of Petroleum Engineers of AIME Preprint SPE 4220, 1972. 14 p, 2 tab, 12 ref.

Descriptors: *Corrosion, Equipment, Metallurgy, *Rusting, Monitoring, Control systems, Maintenance, *Corrosion control, Scour, Erosion, Abrasian, X-ray analysis, Gamma rays, Resistivity, Hydrogen, Oxygen, Carbon dioxide, Liquids, Solids, *Reviews.
Identifiers: Metallic systems, *Corrosion detection, Radiography, Electrical resistance technique, Polarization, Resistance method, Galvanic method, AC resistivity technique, Hydrogen probes, Corrograms.

Operators of metallic systems are looking for new and better tools to monitor, measure, or detect changes both in the metal structure itself and in the rate of attack that the structure is experiencing. To prevent corrosion damage, it is necessary to know when, where, and why the attack is occurring. Otherwise, damage can occur before the owner has knowledge of the attack. Corrosion can be monitored or detected using 'after-the-fact' type tools for detection. Perhaps the oldest detection technique is a visual inspection coupled with measurement of pit depths and/or wall thickness. Ultrasonic and x-ray equipment also can be used to determine the extent of damage. Downhole tubing and casing calipers, possibly in conjunction with wall thickness measurements, can be used periodically to assess the extent of corrosion damage. Perhaps the most desirable monitoring techniques are those that are used more or less continually to determine the rate of corrosion attack. These methods also are suitable to assess the success or failure of the corrosion mitigation measures used. Also, a new corrosion monitor-controller is described. Each of the methods has certain advantages, and the practical applications of these different techniques are reviewed. (See also W74-07857) (Campbell-NWWA)

PROJECT DRUM INLET: EXPLOSIVE EXCAVATION IN SATURATED SAND,
Army Engineer Explosive Excavation Research Lab., Livermore, Calif.
C. M. Snell, and R. H. Gillespie.
Available from NTIS, Springfield, Va. 22161 as AD-769 581, Price $3.75 printed copy; $2.25 microfiche. Technical Report E-73-5, August 1973. 81 p, 32 fig, 8 tab, 30 ref.

Descriptors: *Explosives, *Excavation, *Inlets(Waterways), *North Carolina, Dredging, Canals.
Identifiers: Outer Banks(NC).

A 385-ft-long section of sand separating the Core Sound, North Carolina, from the Atlantic Ocean was excavated with large explosive charges. Twenty-two separate canisters each containing 1 ton of aluminized ammonium-nitrate slurry were emplaced in two rows. All charges were detonated simultaneously at 1327 hours, December 23, 1971. The detonation successfully removed the sand barrier, forming a continuous channel over 80 ft in width. This channel subsequently washed out to a width of about 1000 ft and was used as an access route to the Raleigh Bay fishing grounds. The project demonstrated the practicality of explosive channel excavation in saturated sand. (Knapp-USGS)

DISTRIBUTION AND RELATIVE ABUNDANCE OF FISHES IN NEWPORT RIVER, NORTH CAROLINA,
National Marine Fisheries Service, Beaufort, N.C.
W. R. Turner, and G. N. Johnson.
NOAA Technical Report NMFS-SSRF-666, September 1973. 23 p, 1 fig, 13 tab, 20 ref.

Descriptors: *Fisheries, *North Carolina, *Fish populations, Rivers, Number fish per acre, Estuarine fisheries, Sampling, Marine fish, Freshwater fish.
Identifiers: *Newport River(NC).

In Newport River, North Carolina, during 1970, 104 species of fishes were found in monthly sampling. Sampling extended from the lower reaches of the estuary upstream into tidal freshwaters, and covered a mid-channel distance of 34.87 km. Most of the species of fishes collected in the system were marine forms. Only 15 essentially freshwater species were collected and 5 of these (longnose, gar, gizzard shad, golden shiner, white catfish, and black crappie) showed varying degrees of tolerance for saline waters. Seven species made up 97% of the total catch which comprised nearly 129,000 individuals. The dominant species were all marine euryhaline forms that used the estuary as a nursery area, penetrating well upstream into brackish or even tidal freshwaters. Seasonal distribution and abundance of the dominant species, as well as other species collected in substantial numbers, are discussed. Biomass of fishes in collections by haul seine was estimated at 0.93 g/sq m for littoral waters of the estuary. (Knapp-USGS)

A MANUAL OF FLATFISH REARING,
Skidaway Inst. of Oceanography, Savannah, Ga.
D. B. White, and R. R. Stickney.
Available from NTIS, Springfield, Va 22161 as COM-74-10364, Price $3.25 printed copy; $2.25 microfiche. Georgia University Marine Science Center, Technical Report Series, No 73-7, September 1973. 36 p, 6 fig, 3 tab, 37 ref.

Descriptors: *Fish hatcheries, *Fish farming, Fish management, *Aquiculture, Bottom fish, Bibliographies, Fish stocking.
Identifiers: *Flatfish.

Flatfish may be reared under controlled or semicontrolled laboratory conditions; however, basic knowledge on specific environmental and nutritional parameters is not now available for most flatfish species. The selection of a proper site is probably the most important step toward establishing a facility. Water of low turbidity is highly desirable in culture facilities because outbreaks of disease organisms are often associated with particulate material in the water. Feeding is also enhanced in clear water since the fish are better able to see food particles. Low bacterial and viral levels are required. The site should be located away from any types of industrial or municipal pollution. The water supply should be 0.5 to 2% salinity. Water with a constant temperature of approximately 25 C should provide rapid growth. (Knapp-USGS)

LAKE SUPERIOR INVESTIGATIONS,
Minnesota Dept. of Conservation, St. Paul. Div. of Game and Fish.
R. Hassinger, and A. Kuechenmeister.
Available from NTIS, Springfield, Va 22161 as COM-73-10800, Price $3.00 printed copy; $2.25 microfiche. Minnesota Department of Natural Resources Lake Superior Investigations Completion Report for April 1968 to June 1971. Released October 1971. 7 p, 8 tab.

Descriptors: *Lake Superior, *Lake trout, *Lampreys, *Fish stocking, Fish populations, Fish management, Fisheries, Life history studies, *Minnesota.
Identifiers: *Whitefish.

The Lake Superior lake trout rehabilitation program in Minnesota waters is evaluated by assessment netting. Lake trout abundance steadily increased to 20.7 pounds per thousand feet of net lifted in 1970, then decreased slightly to 17.4 pounds per thousand feet of net in 1971. The incidence of lamprey marks shows an increasing trend. The total wounding rate (fresh and old scars) has increased to 33.6 percent in 1971. Whitefish grounds in Minnesota waters are vey limited with the only area of consistent production in Grand Portage Bay. During the period whitefish abundance has remained at a high level although a decrease was noted in 1971. The bulk of commercial harvest is in the size group 20-24 inches. These whitefish are from 4 to 8 years old. Lamprey marks on whitefish increased in 1971 corresponding with a decrease in abundance. (Knapp-USGS)
W74-12079

WAYS OF INTENSIFYING HATCHERY BREEDING OF STURGEONS IN THE DAM REGIONS OF HYDROELECTRIC STATIONS, (IN RUSSIAN),
F. I. Vovk.
Tr Vologr Otd Nauchno-Issled Inst Ozern Rechn Rybon Khoz. 6. p 125-159, 1972.
Identifiers: *Breeding control, Dams, Flow control, *Sturgeons, Temperature, Hydroelectric powerplants, *Fish hatcheries.

The organization and bioengineering of fish-breeding processes at sturgeon hatcheries located in the dam stretches of rivers are affected by the characteristics of the water regime in connection with stream-flow control. This is reflected in the breeding quality of the spawners. The forced change to pond water and the new operating schedule involve a departure from the optimal regime in all hatchery departments--all operations were done at higher than normal temperatures and with large daily variations. One of the most important measures is the complete regulation of water temperature, beginning from the moment of stocking the spawners to the stocking of the rearing ponds with fry. For this purpose it is necessary to modernize the fish-breeding units and to transfer them to closed rooms. It is also necessary to improve the incubation apparatus method of degumming the eggs, counting the juveniles released from the ponds and qualitative evaluation of production.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Acantocyclops, Bosmina, Ceriodaphnia, Chaoborus, Chir, Chironomus, *Coregonus-nasus, *Coregonus-peled, Cricotopus, Cyclops, Daphnia, Endochironomus, Glyptotendipes, Microtendipes, Oligochaeta, Ostracoda, Polypenilum, Procladius, Sida, Tanytarsus, *Fish diets, Seasonal, Fish hybrids.

The nutrition of 1-summer-old Coregonus peled and C. nasus and their reciprocal hybrids was studied under conditions of pond cultivation. Data are presented which characterize the anatomical structure of the mouth and gullet-branchial apparatus, which determines the nature of the nutrition of the fish studied. Hybrid forms of these species are able to utilize the fodder base of the pond more fully and the efficiency of pisciculture increased significantly. Fodder included: Cyclops, Acantocyclops, Daphnia, Ceriodaphnia, Bosmina, Sida, Ostracoda, Oligochaeta, Endochironomus, Procladius, Glyptotendipes, Microtendipes, Polypedilum, Chironomus, Cricotopus, Ephemeroptera, Trichoptera, Tanitarsus, Chironomidae and Chaoborus.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Algae, *Bacteria, *Benthos, *Carp, Fertilization, *Fish breeding, Grass carp, Hydrobiology, Macrophytes, *Phytoplankton, Seasonal, *USSR(Southern Tadzhik SSR), Fish ponds, *Chlorophyta, Biomass.

Data are given on seasonal dynamics of the population and biomass of bacteria, phytoplankton, zooplankton and zoobenthos in 2 experimental ponds (fertilized) and 1 control pond (unfertilized) used for raising carp and grass carp. The population and biomass of plankton and benthos in the experimental ponds exceeded that of the control pond. The development of aquatic organisms in the ponds depended on the fertilizers applied to them. The food base of the fertilized ponds was higher than in the unfertilized. The intestine of the carp contained 15 spp. and forms of benthos in addition to macrophytes, whereas the food composition of the grass carp was more uniform and consisted mainly of green algae, foulings and macrophytes. The investigation was carried out on the ponds of the 'Chubek' fishery located along the former bed of the Afgan-Darya River in southern Tadzhikistan.--Copyright 1974, Biological Abstracts, Inc.

THE USE OF SODIUM CYANIDE AS A FISH ERADICANT IN SOME QUEBEC LAKES,
Sir George Williams Univ., Montreal (Quebec). Dept. of Biological Sciences.
G. Leduc, Y. Gravel, L. R. Seguin, B. Vincent, and F. Guibert.
Nat Can (Que). Vol 100, No 1, p 1-10. 1973. Illus.

Descriptors: *Piscicides, Pesticide, *Brook trout, Trout, Toxicity, Fry, Fish, Lakes, Fish management, Canada.
Identifiers: Quebec, Sodium cyanide.

The use of sodium cyanide as a fish eradicant was studied for 4 yr and involved the treatment of 1 pond and 5 small mountain lakes of different sizes and depths, where a total of at least 15 spp. of cold and warm water fishes were encountered. Technical sodium cyanide was applied in briquettes and granular forms at a concentration of 1 ppm and, in most instances, a complete fish-kill was achieved. The toxicity disappeared within 25-40 days, and there was evidence of excellent growth of the brook trout fingerlings planted afterwards. It is possible to handle large quantities of sodium cyanide safely, and this can markedly reduce the cost of lake reclamation programs.--Copyright 1973, Biological Abstracts, Inc.

ACTIVE PROJECTS, PURE WATERS RESEARCH.
New York State Dept. of Environmental Conservation, Albany.
February 1974. 33 p.

Descriptors: *Water pollution control, *Water quality control, *New York, *Water conservation, Research priorities, Metropolitan studies, Environmental control, Waste water treatment, Eutrophication, Nutrient removal, Sludge disposal, Scientific personnel.
Identifiers: *Active research projects, Research needs.

Active research projects of the Research and Development Unit of the New York State Department of Environmental Conservation are described. These projects are titled: (1) Candadarago Lake Eutrophication Study, (2) Effectiveness of Lagoons as a Tertiary Treatment Device, (3) Evaluation of a Plastic Media Trickling Filter, (4) Fate of Applied Nutrients in Streams, (5) Land Disposal of Wastewater, (6) Nitrogen Removal by Chlorination, (7) Occurrence and Transport of Nutrients and Hazardous Polluting Substances, (8) Reduction of the Eutrophication of Lower St. Regis Lake by Point Source Phosphorus Removal, and (9) West Coxsackie Project. Lists are included of research personnel and planned future publications. Also given is the current status of 33 reports of the Department concerning environmental quality. Research needs listed are studies of: (1) urban, suburban, recreational and agricultural land runoff water quality; (2) eutrophication of lakes; (3) the development of an economical and workable individual home waste treatment unit; (4) operation of existing wastewater treatment plants; (5) movement of phosphours through soils, (6) means of improving the efficiency and reliability of wastewater treatment processes; (7) sludge disposal technology; (8) nitrogen removal from wastewater; (9) infiltration into sanitary and combined sewers; (10) disposal of toxic materials removed from wastewaters; and (12) economical means to prevent pollution from combined sewer overflows. Descriptors: *Toxicity, *Toxins, *Information exchange, *Information retrieval, Documentation, Publications, Data collections, Bibliographies, Cadmium, Arsenic, Environment.
Identifiers: *Toxic Materials Information Center.

The Toxic Materials Information Center (TMIC) of the Environmental Information System Office collects, stores, and disseminates pertinent information on materials in the environment, with particular emphasis on toxic elements and organometallic compounds. Originally established as a project support center for the EATC Program, TMIC continues to fill this need along with a broader role of information retrieval and dissemination for the whole NSF/RANN Environmental Aspects of Trace Contaminants Program. During the reporting period, TMIC has created data bases pertinent to trace contaminants research; provided information retrieval and acquisition of nonlocal documents and papers; maintained a program library and distribution lists for the EATC Program; and has published special annotated bibliographies on cadmium and arsenic, four issues of NSF/RANN Trace Contaminants Abstracts, and NSF/RANN Trace Contaminants Program Directory. TMIC has also participated in the preparation of state-of-the-art reviews and has completed a preliminary study on the feasibility of extracting environmental data in a tabular format. Origins of communications problems between researchers and those who should use their findings in solving real-world problems are reviewed. Existing systems for continuing education of water resources professionals are seriously deficient in resolving these problems. A survey identified those areas of water resources knowledge of greatest interest to practicing professionals in North Carolina. Over 500 responses indicating serious interest in enhancing professional knowledge in this field. The questionnaire assayed demand for educational materials in 44 specific topics, views on delivery methods, and biographical data for the respondents. Available techniques for information transfer were surveyed and evaluated for potential application under conditions prevalant in North Carolina. At this time special printed materials, taped lectures and slides represent the most practical tools, considering personnel available for their preparation and facilities to which most participants would have access. More complex materials, such as movies, taped television lectures and computer assisted instruction, should be developed but would have minor application immediately because of limitations in personnel and physical facilities. Pilot modules based on taped lectures, slides and written materials were prepared and tested with representative groups of practicing professionals and found to be an effective method of transferring research findings to water resources engineers and other practitioners, if assembled into modules interesting and relevant to their problems and needs. THE DEVELOPMENT AND OPERATION OF A PROTOTYPE STATE ENVIRONMENTAL INFORMATION CENTER,
East Central State College, Ada, Okla. Environmental Information and Media Center.
R. V. Garner.
Final Conference Report for the National Conference on Managing the Environment, Environmental Protection Agency, Washington, D.C., p. VI:32-VI:34. 1974.

Descriptors: *Libraries, *Information exchange, *Information retrieval, *Education, Data collections, Data transmission, Local governments, State governments, Budgeting, Costs, Computers, Films, Documentation, Research facilities.
Identifiers: Oklahoma Environmental Information and Media Center(OEIMC).

The Oklahoma Environmental Information and Media Center (OEIMC) was established by the Oklahoma legislature to meet the pressing need for comprehensive environmental data. Two broad categories were established: (1) short range, i.e., problem solving, enforcement and training, includes environmental management information for small industry, enforcement information for local and state agencies, training materials, and information necessary for research activities, and material solicited by the public; and (2) long range, i.e., education, continuing research and public information, encompasses information for curriculum building, for special interest groups, and for governmental and industrial planning activities. Acquisition of documents, microfiche, abstract listings, films, periodicals, newsletters, journals, and a referral list of environmental expertise began. OEIMC performs a variety of services: (1) problem requests for easily retrievable information, (2) educational displays, (3) a field service for local government and small industry facilitating use of the center's resources, (4) publication of a periodical, and (5) media presentations. Cost factors currently necessitate manual information searches, but an increasing number of requests obviates the use of automation. One such automated system employing a hard wire associative logic, using limited software, easily accessed by keyboard, and accommodating remote terminals is now on loan to OEIMC and will soon be purchased. W74-12353 5C

Social Dimensions of Urban Flood Control Decisions,
W74-12369 6F

Determination on Nevada's Attitude Toward Water Resources Research,
W74-12371 6B

AUFEIS GROWTH
Hydraulic Influences on Aufeis Growth,
W74-12095 2C

AUGLAIZE RIVER (OHIO)
Flood Plain Information: Maumee and Auglaize Rivers, Defiance, Ohio,
W74-12395 4A

AUSTIN (TEX)
Hydrologic Data for Urban Studies in the Austin, Texas Metropolitan Area, 1972,
W74-12653 7C

AUSTRIA (NEUSIEDLER LAKE)
The Distribution of the Submerged Macrophytes in the Reedless Zone of the Neusiedler Lake, (In German),
W74-12150 2H

AUTOMATIC SCANNER
Column Scanning with Simultaneous Use of 241Am and 137Cs Gamma Radiation,
W74-12319 2G

AUTOTROPHIC PHYSIOLOGY
Metabolic Control and Autotrophic Physiology,
W74-12564 5C

AUTOTROPHY
Autotrophy and Heterotrophy in Unicellular Blue-Green Algae,
W74-12587 5C

AVICENNIA-OFFICINALIS
The Steinitz Laboratory of Marine Biology at Elath: An Open Door on the Tropical Seas, (In French),
W74-12398 2I

AXENIC CULTURE
Indicator Species in the Desmid Staurastrum,
W74-12597 5A

AZINPHOSMETHYL
Anticholinesterase Action in Methyl Parathion, Parathion and Azinphosmethyl in Mice and Fish: Onset and Recovery of Inhibition,
W74-12273 5C

AZOTOBACTER-CHROOCOCCUM
Azotobacter Chroococcum in the Phyllosphere of Water Hyacinth (Eichhornia Crassipes Mert. Solms),
W74-12686 2I

BACKWATER
Backwater Effects at End-Dumped Constrictions on Alluvial Channels,
W74-12088 8B

BACTERIA
Data on the Hydrobiology of Fish Ponds of Southern Tadzhik SSR, (In Russian),
W74-12167 8I

Bacteria and the Assessment of Water Quality,
W74-12179 5A

Characteristics of Bacterioplankton of the Ural River in the Orenburg Region, (In Russian),
W74-12497 5C
